Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.

+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.

+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.

+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

Fifty-Seventh Volume

RAILWAY WORLD

January to December, 1913

A

Accident:—
Bulletin 130, 572
Figures, Some 831
Publicity 103
Record, The Month's 129
Roll 216, 397
Accidents:—
Avoidable 920
British Railway 768
Decrease in 872
In 1912 216
In October, Train 1055
Prevention of 89, 868
Recent 572
The Effort to Eliminate 733
Thoughtlessness as a Breeder of 214
Adamson Bill, Railway Valuation as Proposed in the 23
Adworth, W. M., Book Review Quoted 369
Addresses of Prominent Men, Noteworthy 169
Administration:—
A New 267
Business and the 358
Aerial Flight, New Records in 549
Agents Held Guiltless, Forwarding 436
Air Brake:—
Appliance, A New Safety 1058
Problems 507
Tests, Federal Report on 492
Alabama:—
Rate Fight 800
Reduced Fare Enjoined 529
Alaska Carriers' Case Protested 240
Alton and Santa Fe to Pipe Oil Over Mountain .. 397
American:—
Association Report 218
Manufacturers' Export Association, Fourth Annual Convention 890
Railroad Employes' and Investors' Association Disbands 611
Railway Association, Fall Meeting of ... 969
Railway Association, Meeting 1079
Railway Association, On Car Location, Report 157
Railway Association, Spring Meeting of.. 524
Railway Tool Foremen's Association Elects Officers 702
Society of Mechanical Engineers, Meeting of 429
Society of Mechanical Engineers, Railroad Session 1077
Andrews, Frank, Railroads and Farming 749
Annual Reports 863
Anthracite:—
Carriers' Decision, Enforcing 619
Government Renews Suit Against 239
Production, May 624
Shipments During 1912 161
Shipments, November 1082
Trust Decisions, Opinions on 36
Anti-Strikers' Bill Defeated 454
Arbitration:—
Award 920
In Labor Settlements 86
One-Sided 637
Under the Erdman Act 187
Archbald Impeachment Proceedings 12
Ashtabula, Lake Shore Shops at 323
Association Organized, A New Railroad 1079
Atchison, Novel Mail Pouch on the 685
Attorney General, Annual Report of the 1005
Auditing System on Western Lines, New Train .. 218
August, Developments During 809
Automatic:—
Control, Interesting Experiments with .. 130
Stoker, The Problem of the 312
Train Control not Established, Necessity for 130
Train Stop 168
Automobile Shipping Platforms 402
Axle-Lighting System, A New 1060

B

Baggage:—
Agents Elect President 612
Liability 240
Baldwin Locomotive Works Completes Its Forty Thousandth Locomotive 847
Ballast, Report of Committee on 408
Baltimore and Ohio Railroad:—
Boad Case Decided 530
Completion of Important Tunnel 407
Improvements at Cumberland, Maryland.. 882
Improvements on the 324
Machinists' Strike Averted 808
New Locomotive Regulations 873
New Plan for Distributing Coal Cars ... 680
New Tie Treating Plant 605, 683
President Willard's Address to the Officials of the 839
Safety Work on the 215
Sixtieth Anniversary 755
To Pay Semi-Monthly 492
Barber, O. C., On Government Ownership of Railways: A Rejoinder 737
Bede, Gridley, The Valuation of Railroads 928
Benjamin, C. H., Rail Failures 117
Bill, An Extraordinary 454
Bills of Lading, Misdating 186
Biographic Sketches 37, 38
Birmingham-Southern, Seventy Ton Hopper Cars for the 582
Block Signal:—
And Train Control Board, Report of 217
Mileage, Increase in 134
Report of the Interstate Commerce Commission on 491
Boiler:—
Accidents in 1912 136
Inspection 574
Boilermakers' Association, Convention of 496
Bond:—
Market 41, 485, 570, 670, 764, 1047
Prices 210
Book Reviews 255, 975
Boston:—
Connection of Railroad Stations Planned 144
Heavy Suburban Traffic at 1081
Loses Differential Case 538
Boston and Maine:—
Abandons Through New York Service.... 679
At Mechanicsville, Improvements 260
Condition of the 1048
Petitions for Increased Rates 885
To Ask for Rate Increases 701
Box Car Pool, Proposed 678
Box, Utilizing Scrap, A New Construction Pressed Steel Journal 1062
Boyd, George W., Passenger Conditions and their Relations to the Public 1031
Brake:—
New Type of Variable Load 578
Tests of a New 409
Brandeis, The Latest from 366
Breakage, Railway Commissioners on Rail 45
Bridge:—
At St. Paul, New Mississippi River 779
Electric Cable Lift 881
The Largest Concrete Arch in the World.. 1061

VOL. LVII. JANUARY, 1913 No. 1

Important Developments in the Railway Field

DECEMBER was a month of hearings, investigations, bills, programs, reports and recommendations. The country is apparently on the eve of another era of readjustment in intercorporate relations. In Washington the Pujo Committee has been delving into the intricacies of the so-called "Money Trust." The people of southern New England are up in arms against the New York, New Haven and Hartford. Legislatures in a number of States will soon be struggling with public utilities bills. The Democratic majority is laying plans for sweeping tariff revision. Emboldened by the partial success of the engineers, the firemen's organization is pushing their demands for higher wages. Of threats, predictions, demands, charges and counter-charges December has been full. Of actual news, however, the month has not been unusually prolific.

DISSOLUTION OF THE HARRIMAN MERGER.

MOST important of December happenings of interest to the railroads are the decisions of the United States Supreme Court in the Union Pacific and Anthracite Coal Roads cases. On Monday, December 2d, the United States Supreme Court handed down a decision holding that under the Sherman anti-trust law of 1890 the acquisition, by the Union Pacific, of a large block of stock in the Southern Pacific, was illegal.

The importance of the decision lies in its application of the principles of the Sherman anti-trust law to new conditions. The Court, in declaring the Union Pacific holding of Southern Pacific stock to be an illegal combination in restraint of trade, went far beyond the Northern Securities decision. In that case the offense which the decision condemned was the organization of a holding company which exchanged its stock for controlling interests in the stocks of the Great Northern and the Northern Pacific, two companies competing in the same territory. In this case the restraint of trade was actual and direct. In the Union Pacific case, on the other hand, the Court lays down the principle that no matter whether the holding of stock by one company in a

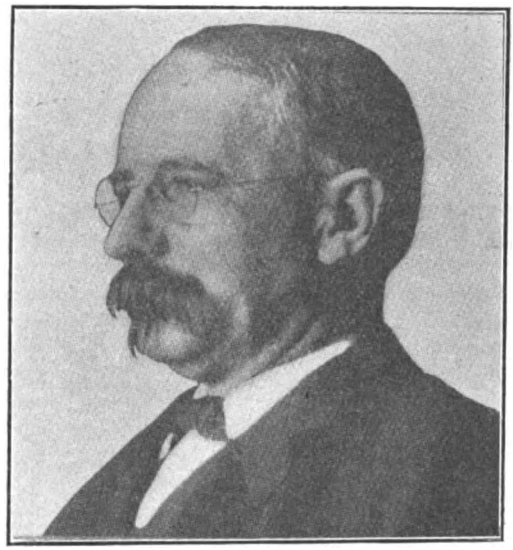
JUDGE ROBERT S. LOVETT,
THE PRESENT HEAD OF THE HARRIMAN SYSTEM.



EDWARD H. HARRIMAN,
THE MAN WHO FORMED IT.

competing company results in an actual restraint of competition or not, the mere power to restrain competition which that stock ownership gives, is sufficient to bring the stock ownership within the prohibition of the statute. And furthermore, according to the Union Pacific decision, it is not necessary that the stock so held should be a majority of the competing line; any holding which is sufficient to enable a company to dominate the policy of a competitor is declared to be unlawful.

The Court holds that "the consolidation of two great competing systems of railroads engaged in interstate commerce by a transfer to one of a dominating stock interest in the other creates a combination which restrains interstate commerce within the meaning of the statute because in destroying or greatly abridging the free operation of competition theretofore existing, it tends to higher rates. Nor does it make any difference," says Justice Day, who wrote the opinion, "that rates for the time being may not be raised and much money be spent in improvements after the combination is effected. It is the scope of such combinations and *their power* to suppress or stifle competition, or create monopoly which determines the applicability of the act."

In the Oil and Tobacco decisions by applying the famous "rule of reason" to determine the illegality of these combinations, it was believed that the Supreme Court had altered the essential character of the Sherman anti-trust law to the extent that unless the Government could prove that a particular combination had actually effected a monopoly of interstate commerce, such a combination should not be declared unlawful. Previous decisions, notably the Northern Securities decision, had strongly emphasized the significance of the power existing in a combination to restrain trade. In that case it was held that since competition by reducing rates and in other ways tends to reduce profits and since the natural tendency of any owner of property is to make that property as valuable as possible, the joint ownership by the Northern Securities Company in the stocks of two previously competing railroads naturally tended toward such a regulation of their policies as would do away, so far as possible, with the effects of competition. Potential restraint of trade was given great prominence in this and in other decisions When the Oil and Tobacco decisions were handed down, however, the emphasis was placed upon actual restraint of trade, upon a conscious and deliberate attempt extended over a period of many years, on the part of these great corporations to secure by methods, whose propriety and legality the Court did not inquire into, the position of dominating influence in their respective trades. These combinations, because of their policies and because of the large measure of success which they had achieved, were declared to be combinations in restraint of trade. Critics of the decisions claimed that so long as no overt acts were committed by combination of previously competing concerns so long as they did not attempt to exclude others from the trade or to gain a supreme position in their line of business, by methods which operated to exclude others, they were in no danger. In other words, that so long as restraint of trade was not unreasonable, that is monopolistic, it would not be prohib-

Digitized by Google

ited. It is upon this interpretation of the decision that the United States Steel Corporation and the American Sugar Refinery Company have relied in answering the Government's charges.

The Union Pacific decision, however, shows clearly that when the Court interpreted the Sherman law in the light of reason it merely meant an interpretation in the light of common sense. In other words, that a law which prohibited every combination in restraint of trade should not be forced and strained into a prohibition of the consolidation between two rival express routes, as Judge Lacombe of the United States Circuit Court, had interpreted it; and the Chief Justice, it will be remembered, in the Tobacco case, showed that the application of the rule of reason brought within the scope of the act many transactions which, by a strict interpretation of its language, would fall outside of its limitations. The Oil and Tobacco decisions, in other words, so far from limiting the Sherman anti-trust law, greatly broadened and strengthened it, and this appears very clearly in the present decision.

How far the Court has gone in protecting the community against the very possibility of monopoly, can be realized when it is considered that this combination between the Union Pacific and the Southern Pacific was not entered into by Mr. Harriman with any other motive than to secure an outlet to the Pacific for the Union Pacific over the lines of the Central Pacific which the Southern Pacific controlled. Mr. Harriman endeavored to purchase from the Southern Pacific the old Central Pacific line running between Ogden, where the Union Pacific terminates, and San Francisco. After failing in this he endeavored to purchase the holdings of the late Collis P. Huntington in the Southern Pacific, and was successful in this after Mr. Huntington's death. It was in the light of this consideration that the Circuit Court held that the combination effected by the purchase was not intended to restrain trade but merely to gain a Western outlet for the Union Pacific and was, therefore, not unlawful.

The Supreme Court rejects this contention. Justice Day says upon this point: "A large amount of the testimony in this voluminous record was given by railroad men of wide experience, business men and shippers, who, with practical unanimity expressed the view that prior to the stock purchasing question, the Union Pacific and Southern Pacific systems were in competition, sharp, well defined and vigorous for interstate trade. To compete is to strive for something which another is actually seeking and wishes to gain. The Southern Pacific, through its agents, advertisements and literature, had undertaken to obtain transportation for its Sunset or southerly route across the continent, while the Union Pacific had endeavored in the same territory to have freight shipped by way of its own and connecting lines, thus securing for itself about 1,000 miles of the haul to the coast. * * * * Competition between two such systems consists not only in making rates, which so far as the shipper was concerned, the proof shows, were by agreement fixed at the same figure, whichever route was used, and then apportioned among the connecting carriers upon a basis satisfactory to themselves, but includes the character of the service rendered, the accommodation of the shipper in handling and caring for freight and the prompt recognition and adjustment of the shippers' claims. Advantages in these respects were the subjects of representation and the basis of solicitation by many active, opposing agencies The maintenance of these by the rival companies promoted their business and increased their revenue. The inducement to maintain these points of advantage—low rates, superiority of service and accommodation—did not remain the same in the hands of the single dominating and common ownership as it was when they were the subjects of active promotion by competing owners whose success depended upon their accomplishment."

Since the union of the two properties by means of stock ownership is held illegal, the Court orders the Union Pacific to dispose of its holdings of Southern Pacific stock within three months. The judgment of the Court, however, is not to be construed to prohibit the Union Pacific from retaining the Central Pacific connections from Ogden to San Francisco, providing that a plan satisfactory to the Government and the Court for accomplishing this result can be devised.

In carrying out the Court's decree the Union Pacific directors are to some extent handicapped by the unexpected opposition of the Attorney General to the plan of dissolution adopted in the Oil and Tobacco cases. Mr. Robert S. Lovett, Chairman of the Executive Committees of the two railroads, on December 18, stated: "The Attorney General of the United States has refused to approve any plan involving the distribution of the $126,650,000 par value of stock of the Southern Pacific Company owned by the Union Pacific Railroad Company exclusively to the stockholders of the latter in proportion to their holdings, whether by sale, dividend, or otherwise, and it is declared that he will appeal in the event the District Court should approve pro rata distribution." The natural method of serving the two companies would be for the Union Pacific to distribute to its stockholders its holdings in Southern Pacific stock. This method is blocked by the Attorney General's opposition. The plan which is likely to be adopted is to sell this stock either to some outside syndicate or to the stockholders of the Union Pacific Company. This method will have the advantage of preserving the assets of the Union Pacific intact instead of reducing them by an enormous dividend

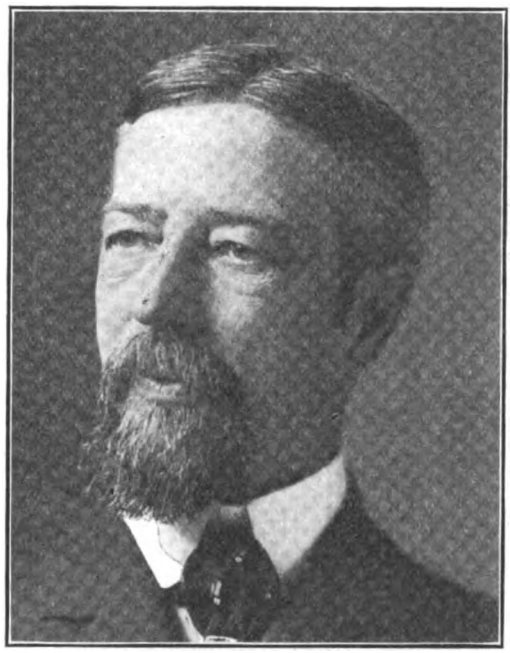
THE ANTHRACITE COAL TRUST DECISION.

THE Union Pacific decision was to some extent offset on December 16th by the Supreme Court, which, in a unanimous decision by the six sitting judges, held that the existence of the so-called "Anthracite Coal Trust" alleged to consist of six anthracite carrying roads and their subsidiaries had not been proved by the Government.

The Court found that the purchase of a majority stock of the Temple Iron Company was for the purpose of preventing the construction of a new railroad into the anthracite region and the railroads owning this stock are ordered to dispose of the same. In reference to the Temple Iron Company the Court says: "This combination of the defendants through the Temple Iron Company was effective, the New York, Wyoming and Western Railroad was successfully strangled, and the monopoly of transportation collectively held by the defendant carrier companies was maintained." The Court also held that the 65 per cent contracts by which a large number of independent operators sell their coal to the carriers at 65 per cent of the tidewater price, are also unlawful, since this series of contracts are "the result of a concerted plan or plot between the defendants to thereby



GEORGE F. BAER, PRESIDENT, PHILADELPHIA AND READING RAILWAY.

secure control of the sale of the independent coal in the markets of other States and thereby suppress competition as between their own output and that of the independent operators, would come plainly within the terms of the statute and as parts of the scheme or plot would be unlawful."

While the Government wins on these minor points which, as a prominent official of the Reading said, are wholly immaterial, the general charge hat the Reading, Lehigh Valley, Lackawanna, New Jersey Central, Erie, and New York, Susquehanna and Western are engaged in an illegal conspiracy to restrain trade was dismissed as not proven. The Court finds that the charge of such a combination was "general and indefinite" and that the case was "barren of documentary evidence of solidarity." Aside from the purchase of the Temple Iron Company and the making of the 65 per cent contracts, there is no further evidence of the combination in restraint of trade.

The Court was asked to deal with certain "minor combinations," for example, the joint control of the Philadelphia and Reading Railroad and the Central of New Jersey by the Reading Company, and the absorption of the New York, Susquehanna and Western in 1908 by the Erie which subsequently took over the Pennsylvania Coal Company. These minor combinations were not passed upon, but were left for future consideration.

It is in this postponement that the chief interest of the Anthracite decision lies and that interest must be considered in the light of the Union Pacific decision. The first decision declared that any contractual arrangement between two railroads engaged in interstate commerce, which contained the possibility of restraining competition between them, was illegal. This principle was laid down in the broadest possible terms. Now, it is well known, both in the anthracite region and

Digitized by Google

generally throughout the American railroad world, that such contractual relations, whether or not they actually restrain competition, have the power to do so, are numerous. The case just referred to of the Reading is familiar. The Philadelphia and Reading Railroad Company and the Central of New Jersey, while not active competitors throughout a large territory, nevertheless do compete, but a controlling interest of both companies is owned by the Reading Company, and in the light of the Union Pacific decision the legality of this controlling interest is seriously called in question. The Lake Shore and Michigan Southern and Michigan Central are competing lines connecting Buffalo and Chicago; the New York Central owns 90 per cent of the stock of the Lake Shore, and 85 per cent of the Michigan Central; the New York, Chicago and St. Louis and the Lake Shore are competing lines between Buffalo and Chicago and the West Shore and the New York Central compete between New York and Buffalo. Here again the identity of interest is apparent. The Cleveland, Cincinnati, Chicago and St. Louis operates an indirect route from Cleveland, a point on the Lake Shore, to Chicago, and the underlying interest in the Big Four is owned by the Lake Shore. Passing to the South the Pittsburgh, Fort Wayne and Chicago and the Pan Handle route connect Pittsburgh and Chicago. Both of these companies are controlled by the Pennsylvania. The Pennsylvania owns approximately 51 per cent of the stock of the Norfolk and Western which carries soft coal to the seaboard in competition with coal moving over the Pennsylvania and other lines. The Lake Shore, a New York Central subsidiary, and the Baltimore and Ohio, which is to some extent controlled by the Pennsylvania, own together a large minority interest in the Reading. The Baltimore and Ohio depends upon the Reading for its entrance into New York. The New Haven and Hartford owns control of the Boston and Maine, with which it is naturally competitive. This list could be continued indefinitely. The whole trend of American railway development has been to eliminate wasteful, costly, cut-throat competition between railroads by various plans of community of interest. Against these plans the Union Pacific decision is directly leveled.

NEW ENGLAND AND THE NEW HAVEN.

SOUTHERN New England is deeply aroused by what it terms the breach of faith on the part of the Grand Trunk Railway Company of Canada and for which it holds President Chas. S. Mellen, of the New Haven and Hartford, responsible. It is well known that President Mellen believes that the prosperity of New England is dependent upon securing of united action by New England railroads. In a statement recently issued Mr. Mellen sums up the situation of New England as follows: "New England is a great terminal railroad yard connecting with substantially all the railroad systems of the country. It is a purchaser of raw materials which must come in by land or sea at competitive and the lowest freight costs. It reconverts these materials and sells them as finished products of a very much lessened tonnage and very much greater value, and this gain in value represents the genius and the labor of New England. Be it ever remembered that New

CHARLES S. MELLEN,
PRESIDENT, NEW YORK, NEW HAVEN AND HARTFORD RAILROAD.

E. J. CHAMBERLIN,
PRESIDENT, GRAND TRUNK RAILWAY.

Digitized by Google

England's incoming and outgoing freight is competitive in all the markets of America and it should be our duty to make it so in all the markets of the world. In this competition the New England States are at a disadvantage as they lie farthest East, and speaking generally, must haul their raw cotton, their flour and outside food supplies, their metals and their coal from extreme distant points.

"In general, the railroad rates to the seaboard are on such a basis that it pays the trunk lines of the country better to dump their freight into New York, both for export and domestic consumption, and to permit the New England lines to participate in the through rates. New England's railroad system must, therefore, forever fight in the railroad world for its own existence and the existence of industrial New England.

"This contest can best be carried on, in my judgment, by a united New England and a united transportation system east of the Hudson River. In union there is strength, and when New England's railroad system is allowed to fight both on land and sea, with the concentrated traffic of New England behind it, the situation is very much better for all New England than if her forces were divided and scattered."

To put Mr. Mellen's case more plainly than he would care to state it, New England's industrial supremacy is dependent upon securing favorable divisions of through rates with connecting lines of railroad leading to the South and West. By controlling the large New England tonnage which could be thrown this way or that, as considerations of advantage might dictate, Mr. Mellen has been able to keep New England in the race for industrial supremacy. In pursuance of this policy the New York, New Haven and Hartford has acquired what is equivalent to a position of dominating control of the transportation system of southern New England. The cost of making the numerous acquisitions, Boston and Maine being the last, has been enormous. It was estimated in 1910 that the company had, up to that time, under President Mellen's direction, paid over $100,000,000 for the securities of various companies and in addition had exchanged its own stock for the stock of the Boston and Maine. The acquisition of his only important competitor raised a storm of protest throughout Massachusetts, and this feeling of hostility and irritation of the people of Massachusetts, who saw the railroad which had been identified with the State for so many years absorbed by a Connecticut corporation, was intensified by a reduction of the Boston and Maine dividend to 4 per cent.

The only effective rival to the New Haven and Hartford in southern New England was the Grand Trunk. This company controls the Central Railroad of Vermont which gives it access to Long Island Sound at New London. It did not, however, have access to more than a small portion of the rich traffic of this section since the New Haven and Hartford would make no traffic agreement with the Grand Trunk. Now began a program of railway strategy whose object, as events have proven, was to force the New Haven and Hartford to make such a traffic agreement. Relying upon the traditional and deeply rooted belief of the American people in the efficacy of railway competition to secure good service and lower rates, the Grand Trunk appealed to the legislatures of Rhode Island, New Hampshire and Massachusetts to grant it permission to build lines from Windsor, Vermont, to Boston, and from Palmer, Mass., on the Central Vermont, to Providence, R. I. Hon. James W. Remick, of Concord, N. H., counsel for the Grand Trunk Railway in that State, in a public letter, addressed to the associate organizations and individuals "whose support of the Grand Trunk may have been induced by my assurances of its good faith," claims that he received the most binding assurances, both verbally and in writing, from Grand Trunk officials "that the purpose of the Grand Trunk was to actually extend its lines to Boston and not, by the menace of extension, to force a traffic arrangement which would merely make the Grand Trunk another ally of the New Haven and leave the peo le more than ever subject to the dominating force of the New Haven and Hartford."

Upon the strength of such assurances Mr. Remick secured the desired public support. He says, "Boards of Trade, the Grange, commercial bodies, and labor organizations, through their accredited journals came to the support of the Grand Trunk. More than 20,000 citizens in every part of the State united in petitions in favor of the proposed extension. All three of the great political parties had adopted declarations unmistakably favorable to the Grand Trunk project. * * * * The legislature chosen was overwhelmingly favorable to the Grand Trunk, a charter to the Grand Trunk to build somewhere across the State to make its connection with Boston would have been granted by the legislature hands down. This was a foregone conclusion, and everybody who had any understanding of the situation recognized it, and none more clearly than those in opposition."

The sentiment of New Hampshire was duplicated in Massachusetts and Rhode Island. Both Boston and Providence promised to provide harbor terminal facilities for the new lines, and Providence has already spent large sums for the purpose. A large amount of work has already been

Digitized by Google

done in Rhode Island by the Southern New England. The New Haven and Hartford opposed the new projects in every possible way, but was unsuccessful.

Suddenly, however, it was announced to the surprise and consternation of the public that the Grand Trunk extensions from which so much had been expected, had been abandoned and also that a draft of a proposed traffic agreement between the Grand Trunk and the New Haven and Hartford was under consideration. This agreement, which has since been published, contemplates the running of through trains, through cars, the selling of through tickets, the checking of through baggage, the through billing of freight, and in all respects the use of the lines of roads of the parties hereto, so far as the public is concerned, as if in reality they were one road; also,

"The meeting of competitive conditions arising from time to time in rates and service, and of maintenance, so long as legally may be of the present differential basis of rates now accorded to the Grand Trunk, except that nothing shall be construed to prevent such modification of said differential rates as may from time to time be agreed to by the Grand Trunk."

By this agreement, if consummated, the Grand Trunk will obtain, presumably on favorable terms, entrance to every town in southern New England, and the people of New England will be able to ship over the Grand Trunk lines and the lines of its connections exactly as though the lines of the New Haven and Hartford and the Boston and Maine has been physically duplicated by the Grand Trunk. In other words, by the proposed agreement New England is given another railroad outlet which is all that the proposed extension of the Grand Trunk contemplated. This obvious fact is, however, lost sight of in the general outcry of denunciation. The prevailing tone of criticism is seen in the following extract from an address before the House Rules Committee by Representative O'Shaughnessy, of Rhode Island, speaking in support of his resolution for the appointment of a committee to make a general investigation of the business and operation of the New Haven in its connection with and ownership of other roads: "The coming of the Southern into New England was hailed with unbounded joy by a people who had suffered long from the grinding monopoly of the New Haven road. The granting of the charter to the Southern road was bitterly fought by the New Haven. The people of Rhode Island, however, gave full faith and credence to the statement made by the late Charles M. Hays, president of the Grand Trunk Railway: 'When any railroad or individual can find one atom of evidence that the good faith of the Grand Trunk or the word of its president has ever been broken it will be time, for monopoly to breed suspicion to bad faith. But if those enemies to progress who have decided upon a dog in the manger policy in Rhode Island want such slanders to bear fruit they must seek some other soil than the record and reputation of the Grand Trunk.'

"The charter was accordingly granted and the Grand Trunk, after overcoming legislative obstacles in New Hampshire and Massachusetts, * * * * started its work among general rejoicing and the fond expectations that a real rival had at last challenged the monopoly of the New Haven. President Hays went to his death on the Titanic, and it appears that honor died with him so far as sacred promises and pledges were concerned. A generous people whose State had been torn wide open had been outrageously betrayed." And the Grand Trunk's counsel in New Hampshire, already quoted, wrote to President Fitzhugh, of the Southern as follows: "Having encouraged the people of New England to expect relief from the existing railway monopoly, and having thereby enlisted their support of the proposed extensions, to now make a deal with the New Haven Railroad for the abandonment of those extensions and leave the people subject more than before to the New Haven domination would be an outrage, as I view the matter. The unused charters and the abandoned works and proceedings would be sure to stand as a monument to the Grand Trunk, stirring the people to unceasing resentment and indignation towards all parties to the deal."

The Grand Trunk officials are extremely evasive in their explanations of the reason why construction work in Rhode Island was abandoned. Financial difficulties are suggested and political hostility is also brought forward. So far as can be learned, however, the real explanation is that with the securing of a satisfactory agreement with the New Haven and Hartford all reason for the new construction from the standpoint of the Grand Trunk disappeared.

President Mellen has been most outspoken in defense of the policy of his company and he has vigorously declared that he was in no way responsible for the abandonment of the Grand Trunk project. In the statement already referred to he says: "It is a delicate matter for me to discuss my railroad neighbors with whom I hope to live in peace and do business; but I am not responsible for either the beginning or the end of the Grand Trunk attempt to reach Providence. I will make this statement as positive as any one could wish, and I do not know at this moment that the plan of its going to that city has been abandoned."

Aroused by this incident, the long cherished resentment of New England toward the New Haven and Hartford has burst into flame. The newspapers are filled with denunciations of the bad

Digitized by Google

service and inadequate facilities which it is claimed the company furnishes. Scheduled and actual time of fast trains are published, statistics of wrecks are given much prominence in certain newspapers, the high prices which it is claimed the New Haven is paid for control of other companies are made much of, and, in short, by every device of the professional agitator with which the enemies of the New Haven and Hartford by long practice are entirely familiar, the attempt is made to work up public sentiment against the road. By some it is proposed that the new line should be built by outside capital; again, the State of Massachusetts is urged to exercise the right reserved in the Boston holding company bill to purchase the stock of the Boston and Maine, now held in the interest of the New Haven and Hartford by that company. More recently indictments have been found against prominent officials of the New Haven.

Most of this criticism has some foundation in facts. There are few railroads in the country, especially in recent years, when the cost of operation has mounted so rapidly, which cannot be charged to some extent, with inadequate facilities and service. When Mr. Mellen took charge of the New Haven and Hartford its property was in very bad condition. He had made very great improvements in facilities and service but most of these leave much to be desired. Although a large amount of money has been spent in improving the property, his view of the necessities of the situation influence Mr. Mellen to utilize the credit of the company to the uttermost in securing a position of control which would enable him to maintain the interests of New England in competition with other sections.

That this purpose has been pursued by Mr. Mellen in entire good faith and in an honest desire to advance the interests of the section where he was born and where nearly his entire active life has been spent is not to be doubted. The people of New England may not be, and are not, apparently satisfied with certain features of the New Haven management. They claim that the rates are too high, that the train service is inadequate, and that station facilities are unsatisfactory. They claim, also, that the property of the New Haven, and this criticism can be made with equal justice of the property of the Boston and Maine, is not in first class condition and that passenger traffic over its lines is not entirely safe. It is true that these criticisms can be directed with equal force against many other large railway companies, but this does not alter the fact that as President Mellen conceded, the service and facilities of the New Haven are by no means perfect. What, then, is to be done? How can the situation best be remedied?

Apparently it is the belief of Mr. Brandeis and his associates in the attack upon the New Haven, that the company can be induced to improve its service and facilities if only sufficiently harassed by legislatures, courts and commissions, if it is properly investigated by congressional committees, if its corporate relationships are attacked by the Department of Justice, and if its officials are placed under indictment by federal grand jury. This is the improved method of rectifying corporate abuses in the United States, and just now it is being utilized to the fullest extent in New England. So far has the public mind been inflamed against the company that President Mellen states: "We have been obliged now for several weeks to have our tracks constantly patrolled and in spite of the most unusual precaution have been unable to prevent two notable attempts and several minor ones at train wrecking. The number of attempts to secure newspaper notoriety by loosening spikes and reporting them to discredit the road, has been most deplorable." The people of New England are struggling in the throes of a veritable spasm of self pity. Pulpit, platform and press abound with cries of anguish, they are the innocent victims of oppressive railway monopoly. Unless they rise in their might and shake off the yoke of the oppressor, however this may be done, even worse things may befall them.

This excitement and agitation seems to us to be somewhat overdone. The railroads of New England are subject to the absolute control of the States through which they run. It is within the powers of the legislatures of these States to clothe their public utility commissions with authority over rates, finances, facilities and service as absolute as the authority possessed by the utility commissions of New York and Wisconsin. In this way the people of the New England States can construct machinery adequate to regulate and reform every abuse of which they now complain.

The principle of railway regulation and the public responsibility of the railway is now generally admitted, but there is a right way and a wrong way to exercise such regulation. The right way is by the careful methods of public service commissions to which the legislature delegates its authority over public utility companies. By this method the corporations are protected against such senseless competition as that proposed by the Grand Trunk which could have had no other effect than to increase the fixed charges which New England traffic must bear, and at the same time, these companies can be prohibited from charging unreasonable rates. Issues of stocks and bonds by public service corporations can be properly supervised, a high standard of service can be insisted upon and the provision of facilities adequate to perform such service can be required. This, as above stated, is the right way to rectify railway abuses. The wrong way is that now being so perfectly exemplified by the good people of New England.

THE RAILWAY LABOR CONTROVERSY.

THE recent award of the Arbitration Commission gives the Trunk Line engineers substantial advances in pay, an award which has been immediately followed by the presentation of demands on behalf of the firemen employed by the same companies. These demands would entail an increase in operating expenses, according to Mr. Elisha Lee, Chairman of the Managers' Committee of the railroads, amounting to $15,134,000 a year. These demands represent, however, substantial reductions from those originally presented, which included proportionately higher wages for overtime and two firemen on all freight engines. After discussion of the original proposals, the representatives of the firemen made material modifications in their demands with the result that the conference committee of managers, as Mr. Lee states in a letter to W. S. Carter, President of the Brotherhood of Locomotive Firemen and Enginemen, have reached the conclusion that many features of the firemen's requests seem to be "susceptible of satisfactory solution and agreement." The outlook is, therefore, for a satisfactory solution of the differences between the parties, involving material increases in pay and a comprehensive revision of the rules relating to delays of terminals, overtime, etc., on the same basis as that arrived at by the engineers' arbitration committee.

Indications are that the award of the committee which arbitrated the differences between the Trunk Line railroads and their engineers will furnish a standard for the decision of similar questions in the future, and will, therefore, contribute largely to remove the constantly recurring menace of railway strikes. The findings of this Arbitration Board were made public in November. Its full report, however, has just come to hand and contains some noteworthy suggestions regarding the future settlement of difficulties of this character.

The Board states that the territory served by the railroads concerned in the dispute which they were called upon to settle, contained a population of over 38,000,000, or about 32 per cent of the total population of the United States. The railroads affected by these demands had an aggregate, in 1910, of 66,876 miles of main track, or 25.1 per cent of the total mileage of the country. The engineers employed by these companies had voted to strike, subject to the decision of the executive officers. If a strike had been called, the resulting damage would have been almost incalculable.

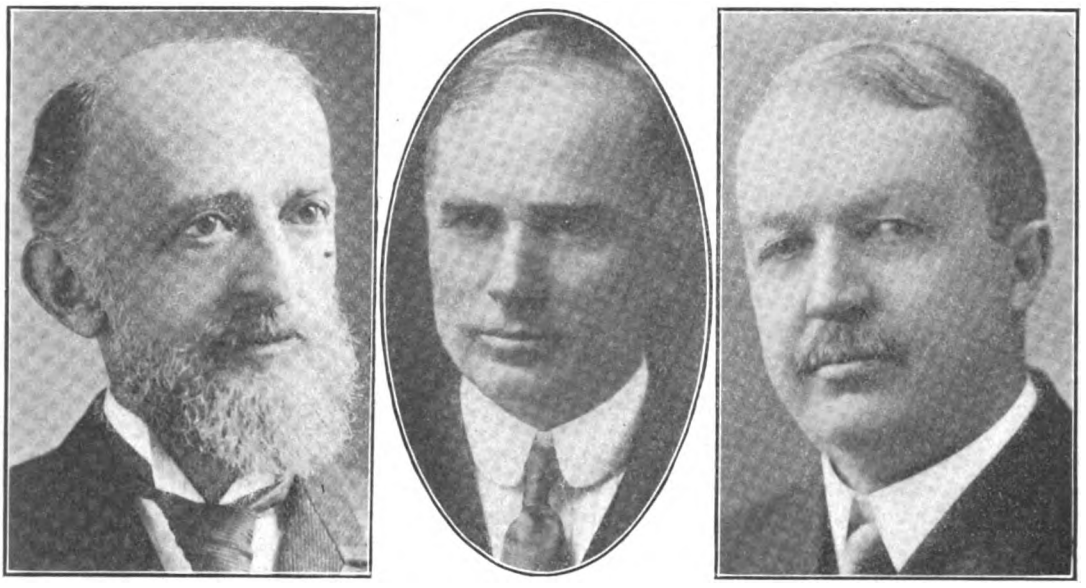
Upon this point the committee makes the following forceable observation: "An effective strike on these railroads, extending through an area that includes all New England, New York, New Jersey, Pennsylvania, Delaware, Maryland, Ohio, Indiana the lower peninsula of Michigan and a small part of West Virginia, would have had most disastrous effects upon the commerce and industry of this entire region, to say nothing of its effects upon the remainder of the country. Indeed, it would be difficult to exaggerate the seriousness of such a calamity. While no statistics on the subject are available, it is safe to say that the large cities of the East, if a strike had taken place, would have found their supply of many articles of food exhausted in a week. Of so important commodity as milk they have not usually more than a day's supply. Many of the people in these cities would, therefore, have been short of food if a strike had taken place. Assuming that no damage was done to their property, the loss of the railroads through cessation of business would have been enormous. The total operating revenues of the 52 railroads concerned amount to over $20,000,000 a week, and the net operating revenue to nearly $7,000,000 a week. The loss to the engineers would likewise have probably run into the millions."

This situation is a continuing one. At any time, the leaders of organized railway labor have the power to inflict almost incalculable damage upon the country. A general and protracted suspension of railroad transportation effecting such a wide area, would be a national calamity, comparable to the effects of war or pestilence. The four railway brotherhoods possess an absolute monopoly of the skilled labor necessary to conduct the business of transportation. Skilled railway operators cannot be replaced by non-union men; for locomotive engineers or firemen there are few substitutes; if they cease to labor, the trains cease to move, commerce comes to a standstill, factories close, business staggers and stops.

The practical result of a recognition by both parties to these wage controversies of the advantage possessed by railway labor, has been to greatly weaken the position of the companies in negotiating with their employes. Responsible heads of railway companies could not bring themselves to face the possibilities of a general suspension of traffic, if the most extreme concessions on their part could prevent it.

The recommendations of the Arbitration Board deal with this situation which they aim to make in the future, impossible. From the viewpoint of the public, they say, "It is an intolerable situation when any group of men, whether employes or employers, whether large or small, have the power to decide that a great section of the country, as populous as all of France, shall undergo

Digitized by Google



OSCAR STRAUS. DANIEL WILLARD. P. H. MORRISSEY.

Three Members of the Board of Arbitration Which Made the Awards in the Engineers' Wage Controversy. President Willard represented the Railroads, and P. H. Morrissey the Engineers.

great loss of life, unspeakable suffering and loss of property beyond the power of description, through the stoppage of the necessary public service." The Board finds a solution of the difficulty in an application to American conditions of the principle laid down by Premier Briand for the French ministry when they settled the French railway strike of 1910 by calling all railway employes to the colors, thus making them public servants. The military duties to which these employes were summoned consisted in the maintenance of the railway in normal working order and in obeying the orders of their official superiors. Disobedience would entail the punishment provided for by military law. The principle upon which this action was taken was "that public servants must be required to discharge their duties regularly and without interruption" and the Premier further declared that "if the Government had not found in the law that which enabled it to remain master of the frontiers of France, and master of its railways, which are indispensable instruments of the national defense, if, in a word, the Government had found it necessary to resort to illegality it would have done so."

The Board finds that a situation similar to that confronting the Ministry of France might have arisen in the United States if the contending parties in the engineers' controversy had failed to agree, and that in the interest of the public welfare, a basis must be established for the prompt settlement of such controversies without endangering the welfare of the public. The plan proposed is to have a continuous Board of Adjustment to which should be entrusted the duty of deciding in all cases where the railroads and their employes could not agree upon questions affecting wages, hours of labor and working conditions. This Board should have a corps of experts and statisticians and should be allowed to investigate each case fully. Furthermore, the decisions of this Board must be binding upon both parties.

Upon this point the Board says: "In the last analysis, the only solution—unless we are to rely solely upon the restraining power of public opinion—is to qualify the principle of free contract in the railroad service. A strike in the army or navy is mutiny and universally punished as such. The same principle is applied to seamen because of the public necessity involved. A strike among postal clerks, as among the teachers of our public schools, would be unthinkable. In all these cases, the employment, to borrow a legal phrase, is affected with a public use, and this of necessity qualifies the right of free concerted action which exists in private employments.

"However, if the principle be accepted that there are certain classes of service thus affected with a public interest, and men who enter them are not free concertedly to quit the service, then these men must be guarded in the matter of wages and conditions by public protection; and this it is believed can best be done through an Interstate Wage Commission."

It is not surprising that the representative of the engineers, on the Board, Mr. P. H. Morrissey,

Digitized by Google

should have filed a minority report protesting upon the proposed application of the principle of railway arbitration. He does protest and most vigorously against a proposition which he says "strikes at a vital and fundamental principle affecting the legal and economic rights of railway employes. No fault can be found with the public interest in keeping open the arteries of commerce; indeed, the railway is an essential part of our modern civilization. It is dedicated to the public use, and laws regulating it in the public interest are now an established policy. But with all this, railways are privately owned, and the relation of the railway employe to his employer is private and not public. Whatever relation the railway employes may have to the public is secondary and through his employer. The railway hires, establishes the pay and regulations of employment, and exercises its prerogative as a private employer by dismissing the employe. In all this the public has no voice and very little interest. * * * * These conditions make necessary the organization of railway employes for their own protection and advancement, just as if they were engaged in any other industry. To take away from them their present industrial defense because of their relation to the public service, simply with the promise that they would be treated fairly by a wage commission, or other tribunal created for the purpose, is wholly inadvisable."

In spite of this hostile attitude of the leaders of organized railway labor towards compulsory arbitration of wage disputes in industries affected with the public interest, it is to compulsory arbitration of railway labor disputes that the United States must come, unless railway labor ceases to flaunt the menace of a strike whenever they approach a settlement of differences with their employers. It is this constantly repeated threat of a strike which has been effective in forcing wages in the railway industry so far above the level prevailing elsewhere; which has prevented such advance of railway earnings as would have given the necessary inducement in investment in railway securities; and which has for years transferred to railway labor the lion's share of increased railway profits. This strike menace must be removed; let us hope as a result of conference and conciliatory discussion, such as has characterized the negotiations between the Trunk Lines and the firemen, but if not by conciliation, then the public must take a hand.

If the leaders of railway labor are unable to see that they have a national obligation to perform, that, along with their vast power goes a corresponding responsibility, that they must not press their demands for higher wages to the point of making railway investments unattractive and restricting the necessary expansion of railway facilities, and, above all, that they must not threaten the public with the terrible calamity of a general railway strike, they will be made to realize in line with the recommendations of the Arbitration Board that there is a power in this country that is greater than the power of organized labor,—the irresistible power of an aroused public sentiment, and that the interests of no class—no matter how valuable the services performed by that class—can be allowed to stand in the way of the interests of the American people.

ANNUAL REPORT OF THE SECRETARY OF COMMERCE AND LABOR.

THE railway labor situation is reviewed in the fourth annual report of Secretary Chas. Nagel, of the Department of Commerce and Labor. This report contains two features of unusual prominence and interest. The first is the recommendation of the establishment of a Board of Conciliation to settle disputes between railway employes and managements, and the second is the condemnation of hasty legislation directed toward the establishment of a trade commission. The Secretary recommends the creation of a Board of Conciliation and Arbitration to be named by the President and confirmed by the Senate. Such a Board would have so much power and prestige that it is unlikely that any controversy would arise which it would not be able to settle peaceably even though its findings were not made obligatory upon the parties.

In reference to the proposal that a Trade Commission should be established, the Secretary points out the danger that such a commission "once created, would soon be vested with further powers. The disposition will undoubtedly be to give it authority to fix prices and conditions of operation similar to that which the Interstate Commerce Commission now exercises with respect to railroads and their rates. In other words, there is a strong tendency to disregard the fundamental distinction between a public carrier and a private enterprise."

THE ATTORNEY GENERAL ON CORPORATE REGULATION.

ATTORNEY GENERAL WICKERSHAM, in his annual report, also deals with the question of further corporate regulation. The Attorney General defends the Commerce Court, the abolition of which was attempted at the last session of Congress. A return to the old method of distributing litigation arising from the orders of the Interstate Commerce Commission to the District Courts, would, in his opinion, be injurious to the public and delay the administration of justice.

Digitized by Google

He said: "In my opinion the Commerce Court has proved a far more satisfactory instrument for the determination of legal questions arising out of the orders of the Interstate Commerce Commission than the former method by which such questions were passed upon in the various Circuit Courts throughout the country.

"It is much more expeditious; it has upheld the Commission in a larger portion of cases than did either the Circuit Courts or the Supreme Court; and it has granted temporary injunctions with less freedom than the Circuit Courts did. I believe it would be very injurious to the interests of the public as well as to the due, convenient and expeditious administration of justice to now return to the old plan of distributing the litigation among the many District Courts of the United States. In my opinion the criticisms which have been made of the Commerce Court are due chiefly to the fact that the scope of judicial review over the orders of the Commission has not yet been clearly defined either by act of Congress or by authoritative decisions of the Supreme Court."

In reference to the proposed amendments of the Sherman anti-trust law which would particularize the offences under the statute, the Attorney General, while admitting that "The experience of the past year in endeavoring to enforce criminal liability under the Sherman law has not been encouraging" is, nevertheless, of the opinion that the advocacy of amendments of the law which shall particularize different acts as constituting unlawful restraint or attempts at monopoly, has its origin, not so much with those who desire the enforcement of the law, as with those who are anxious to secure a safe means of its evasion. An enumeration by statute of the different practices which, in and of themselves, without regard to the circumstances of particular cases, should be declared illegal, would either go too far or not far enough." So far as protecting the public against the consequences of monopoly is concerned the Federal courts have found no difficulty in applying the terms of the law to meet and enjoin the continuance of any form of unfair competition which has resulted in imposing an undue restraint upon interstate commerce or which makes for monopoly.

THE ARCHBALD IMPEACHMENT PROCEEDINGS.

THE Attorney General's praise of the Commerce Court is particularly interesting at this time in view of the approaching termination of the trial of Judge Robert W. Archbald of that tribunal. Little that was not produced in evidence before the House Committee which investigated the charges against Judge Archbald has been brought out in the trial before the Senate. The fact has been clearly established that the Judge engaged in business negotiations with the railroads which were or had been suitors before his court. No evidence has been produced to

support the charge that he made any direct use of his official position to obtain an advantage in these negotiations. Graft has been defined as the obtaining of some pecuniary advantage or benefit through holding a position of trust. It is not necessary that the recipient of such an advantage should have directly used his position of trust to obtain it. If the advantage comes to him because of the position which he occupies, his accepting it, renders his motives open to suspicion. From the evidence presented, it is hardly doubtful thatJudge Archbald was invited into certain business deals because of the high position which he occupied and which made his influence valuable. There is no evidence, however, that he made an improper use of his position or that any litigant before his court gained or lost because of the Judge's interest in outside business matters.

ANNUAL REPORT OF THE SECRETARY OF THE TREASURY.

THE report of the Secretary of the Treasury is mainly taken up with the perennial subject of currency reform. Secretary MacVeagh contends that our currency system is responsible for panics and he says, "As long as our banking and currency system remains as it is the immeasurable disaster of a panic will remain a possibility. The system under which we are living will not only not prevent a panic, but after a certain point in the generation of panic conditions is reached will make it inevitable. So that, as long as the financial system created by our federal laws remains unchanged and unreformed, the Government will be exclusively responsible for the commercial, industrial and social disasters which flow from panics." Secretary MacVeagh also frankly recognizes that under the present system the treasury acts as the reserve agent for the banks, in that it collects during periods of easy money a large fund of cash which it can release into the channels of circulation when stringency arises. He justly considers, however, that this is an ineffective and clumsy substitute for a central bank whose advances shall not be made upon the arbitrary determination of a public official but in response to the demands of trade as evidenced in applications for loans.

ANNUAL REPORT OF INTERSTATE COMMERCE COMMISSION.

THE leading feature of the report of the Interstate Commerce Commission is its treatment of the question of accidents. "With the track and roadway conditions existing upon many railroads in this country the danger of derailments is ever present. Of thirty-one derailments investigated, fourteen were either directly or indirectly caused by bad track. * * * * It is believed that lack of men and material are responsible for bad conditions on many roads." A disquieting feature in the problem of accident prevention is the large number of train accidents caused by derelictions on the part of employes. By far the greatest number of serious train accidents are due to the failure of some responsible employe to perform his duties. "The Commission believes that as a rule there are no men who have a keener appreciation of their responsibilities than railroad trainmen and enginemen. However, changing conditions on railroads have increased the duties of employes and multiplied the chances of error. In spite of this, methods of discipline and regulations calculated to insure safety have remained practically unchanged."

The Commission might have added that many of the economies have been forced upon the railroads by their inability to obtain higher rates and by pressure from organized railway labor, which has resulted in largely increasing their wage bills, have made it impossible for them to do everything that their officials could wish in the way of making accidents infrequent. The question of discipline is also seriously complicated by the disposition of organized railway labor to take issue with railway officials in matters of fine, suspension and discharge.

The Commission criticises excessive speed. The aim should be to maintain safety rather than speed and adequate measures should be taken to compel low speed wherever conditions require it, whether schedules are maintained or not. The Commission strongly favors the general establishment of safety committees which have been organized on many roads to devise methods for increasing the safety of operation.

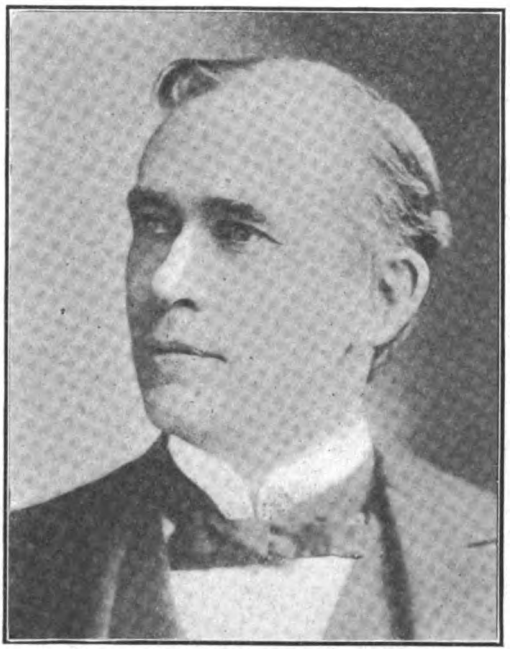
In a brief reference to the express rate inquiry the Commission claims that this investigation was the most important single piece of work ever done by it, and states that the express companies, on the basis of its findings, are now engaged in a comprehensive revision of their methods which will be of the greatest benefit both to themselves and to the public. "The most important prosecutions of the year," the report states, "may be said to be those which are based upon frauds perpetrated in connection with various transit privileges. Twenty-eight of these indictments have been returned, fifteen being against shippers, and thirteen against carriers. In every case they are based upon substitutions of commodities at transit points by which public rates were violated. The frauds incidental to the transit privilege are widespread, and further prosecutions of both carriers and shippers will probably be necessary before the violations of the act in this regard are discontinued."

Digitized by Google

An examination of the list of indictments returned since December first, 1911, shows a large number for the offense of false billing and misdescription. This abuse, from which the railroads suffered for many years, the Commission has at last, after being repeatedly urged to do so, undertaken to regulate. A number of pleas of guilty have been entered in these cases and heavy fines have been imposed in certain instances.

For the first time in the history of the Interstate Commerce Act indictments have been returned for the offense of giving and receiving free passenger transportation for journeys within a State in consideration of particular routings of interstate tonnage. These were returned in November last in Colorado against certain carriers and shippers where the Commission had discovered that a systematic policy of distributing State passes to interstate freight shippers has been pursued.

Important decisions have been made during the year by the Supreme Court affecting the powers of the Commission. In the Lumber cases the orders of the Commission establishing rates on lumber from points of production along the Pacific Coast in the Northwest to Eastern destinations had been enjoined by the Circuit Court on the ground that this order was "so" palpably and gravely unjust and unreasonable as to be beyond the substance, if not beyond the form, of its power. The Supreme Court, to which the case was carried, held that the orders of the Commission are final so long as the Commission acts within its power and that an order, regular upon its face may be set



CHARLES A. PROUTY, CHAIRMAN, INTERSTATE COMMERCE COMMISSION.

aside only in case it appears that the rate is so low as to be confiscatory, or if rates were fixed contrary to evidence, or if the authority of the Commission has been exercised "in such an unreasonable manner as to cause it to be within the elementary rule that the substance and not the shadow, determines the validity of the exercise of the power." The court will not consider the expediency or wisdom of the order, or whether, on like testimony, it would have made a similar ruling. "The findings of the Commission are made by law prima facie true, and this court has ascribed to them the strength due to the judgments of a tribunal appointed by law and informed by experience."

In the Proctor and Gamble case the demurrage rules of the carriers provided that demurrage should accrue upon a car owned by private individuals until unloaded, even though the car might be standing upon the tracks of its owners. The complainants attacked this rule before the Commission, alleging that it was unjust in that it imposed demurrage upon their private tank cars after they had been returned to the possession of their owners. The Commission sustained the rule and dismissed the complaint. Proctor and Gamble appealed first to the Commerce Court and then to the Supreme Court. The question turned upon the right of the Commerce Court to review a negative order of the Commission. As the Supreme Court stated it: "In other words, the important question is: Is the authority of the Commerce Court confined to enforcing or restraining, as the case may require, affirmative orders of the Comm ission, or has it the power to exert its own judg-

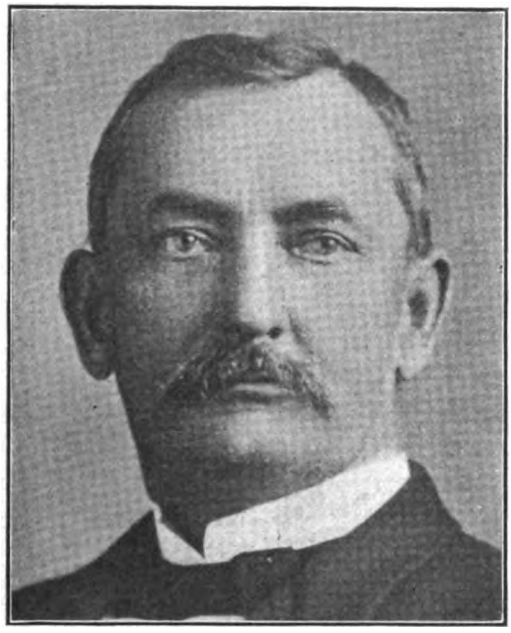
Digitized by Google

ment by originally interpreting the administrative features of the act to regulate commerce and upon that assumption, treat a refusal of the Commission to grant relief as an affirmative order and accordingly pass on its correctness. The Court found that the interpretation of its powers by the Commerce Court was incorrect, and that Congress in establishing the Commerce Court, did not intend to substitute that court for the Commission or even create a divided authority on administrative matters. This decision establishes the principle that the administrative orders of the Commission cannot be reviewed by the courts, in so far as they are within the delegated authority of the Commission, are not confiscatory and are not palpably arbitrary and unreasonable."

PHYSICAL VALUATION BILL.

THE Interstate Commerce Commission has repeatedly asked for authority to make a physical valuation of railroads. This authority is given to it in a bill passed by the House of Representatives on December 5th, and is as follows:

The bill provides that the value of railroad property shall be ascertained by means of an inventory of each system, which shall list and classify the physical elements in conformity with a classification of expenditures for road and equipment that may be prescribed by the Commission. The Commission is given authority to ascertain and report as to each piece of property owned or used



CONGRESSMAN WILLIAM C. ADAMSON, AUTHOR OF THE PHYSICAL VALUATION BILL.

by the railroads, the original cost for railway purposes, the cost and value to the present owner and what increase in value is due to cost of improvements.

The Commission also is instructed to ascertain any increases or decreases of capital stock in any reorganization of railroads and moneys received by any such corporations by reason of any issues of stocks, bonds or other securities, or from the net and gross earnings of such companies and how the moneys were paid out.

The Commission is further directed to report the amounts and dates of all retired bonds outstanding, the names of all stockholders and bondholders with the amount held by each and also the name of each director on each board of directors, the facts as to the connection of any bank or banker, capitalist or association of capitalists or financial institution or holding company with the ownership, manipulation, management or control of any stocks and bonds of any railroad.

Every railroad is required by the bill to assist in the investigation "as the Commission may require and direct." The proposed law is applied to receivers of carriers and operating trustees as well as managing directors and other officials. Any official who refuses to comply with an order of the Commission made incident to the inquiry is liable to a fine in the sum of $500 for each offense.

The passage of this bill is of great interest in view of the fact that the Supreme Court is expected shortly to hand down its decision in the Minnesota rate cases. In these cases the reasonable-

Digitized by Google

ness of the rates established by the Minnesota Rate Commission are to be determined by reference to the valuation of the physical property of the companies involved and their ability on the basis of these rates, to earn a fair return on this valuation. The attitude of railway officials toward physical valuation has been greatly modified in recent years by the proof of a fact which is long believed, namely, that physical valuation so far from resulting in a reduction in railway rates would inevitably lead to an increase if the courts continued to follow the principle that the public service corporations are entitled to a reasonable return on the fair value of its property employed in the public service. Such valuations as have been made tend strongly to confirm this conclusion. The valuations made in connection with the Minnesota rate cases have already been referred to. On the basis of these valuations the Circuit Cour refused to allow a reduction in rates. The Massachusetts Validation Commission, composed of the savings bank commissioner, the railroad commissioner and the tax commissioner, studied for eight months the entire New Haven property of the New York, New Haven and Hartford, including railroad property and its investments, and reached the conclusion that the New Haven had assets amounting to $101,000,000 over and above all outstanding stock and debts. The Lehigh Valley has been carrying on for nearly a year a physical valuation of its property and the result is to put a value of $300,000,000 on the company's property used for transportation, exclusive of coal lands and collieries. Last year the company earned 3½ per cent on this valuation. The railroads have nothing to fear from a physical valuation, which is reasonably certain to protect them against further reduction in rates and which may even result in obtaining for them the higher rates which public necessity so urgently demands.

ANNUAL DINNER OF RAILWAY BUSINESS ASSOCIATION.

THE fourth annual dinner of the Railway Business Association was the largest and most representative in the history of that organization, whose members include most of the important manufacturers of railroad supplies. Among the guests were thirty-one railway presidents, members of the board of directors of important roads, more than 100 railroad vice-presidents, the presidents of large banks and the principal officials of corporations, such as the Steel Company, which are closely affiliated with the railroad business.

The principal address of the evening was worthy of the occasion and the audience, and was delivered by Mr. James J. Hill.

The subject of Mr. Hill's address was "The Country's Need of Greater Railway Facilities and Terminals." The tone of his speech was most pessimistic. He claimed and proved that railway fa-

JAMES J. HILL,
WHO DELIVERED NOTABLE ADDRESS AT FOURTH ANNUAL DINNER OF THE ASSOCIATION.

Digitized by Google

cilities have not expanded in recent years to keep pace with the growth of the agencies which produce the traffic. Especially is this true of railway terminals, and in the speaker's opinion, these must be promptly enlarged, or the most serious consequences may be experienced. "Every interest in every community," said Mr. Hill, "should understand that the main need to-day of transportation and of the many activities connected with and dependent upon it, is an increase of terminal facilities. It is no exaggeration to say that the commerce of the country, its manufacturing and agricultural industry, its prosperity as a whole, and the welfare of every man in it who engages in any gainful occupation, can escape threatened disaster only by such additions to and enlargements of existing terminals at our great central markets, and our principal points of export as will relieve the congestion which now paralyzes traffic when any unusual demand is made upon it. Our natural material growth will make this their chronic condition in the near future unless quick action is taken."

Starting from this theme, Mr. Hill proceeded to develop the thought that the prosperity of the United States depended upon the provision of large amounts of money in the near future for the enlargement of existing railway facilities. He pointed out that this money could not be raised under existing conditions of railway revenue. The rate which railroads must now pay for money has advanced from 1½ to about 2 per cent in ten years.

Railway properties are already encumbered to the limit of traffic insolvency. "Securities have been consolidated, equipment trusts have replaced what are practically chattel mortgages on rolling stock, and money cannot be raised except for a short term and at high rates. * * * * Since the greatest need is larger and better terminals, the process of improvement will be costly. Since the sum to be raised must be reckoned in billions, the railroads, if they are to maintain their wage scales and their standards of efficiency, must be permitted to charge such rates as will enable them to pay interest on the additions to capitalization representing the money invested in new terminals and also accumulate a surplus sufficient to take care of the constantly arising demands for additions to the existing plant. * * * * Rates either permanently unchanged at the present figure or lowered by compulsion mean, in view of the existing emergency, nothing but ruin. That ruin will not be so immediate or complete for the railroads themselves as it will be for the business interests to which they will no longer be able to give a prompt and adequate service. It will be far reaching because its effects will affect every man, however humble, who is engaged in active industry."

ENGLAND AND THE PANAMA CANAL.

THE protest of Great Britain against the provisions of the Panama Canal bill passed by Congress, mainly rests upon the contention that the Hay-Pauncefote treaty was clearly violated when it undertakes "to remit, or refund, tolls on all American shipping using the canal," and it is also maintained that the same objection would probably apply to coastwise shipping because of the impossibility of framing regulations which would not result in preference to American shipping. Protest is also made against the exclusion of British ships owned by Canadian railroads, and the suggestion is made that the difficulties between the two governments, if it is found impossible to settle them by negotiation, should be referred to The Hague Tribunal. The objection to the remission of tolls on coastwise vessels is based upon the argument that through such remission, the revenues necessary to maintain the canal must be obtained by charging higher tolls on foreign ships.

The British Government does not object to the payment of subsidy and the argument above stated seems to have little merit. The American people, however, are not in favor of ship sub-

Digitized by Google

sidies and there is little sentiment in favor of the remission of tolls to coastwise vessels. Most important, however, of the objections to the Panama Canal Bill in its present form, is the Hay-Pauncefote treaty, which stipulates that the shipping of all nations should be treated alike and that the canal should be free and open to the vessels of commerce and war of all nations without discrimination.

That the British view of the Panama Canal bill finds support from the Administration is seen in the annual report of Secretary of War Stimson, that the act of Congress granting free passage through the Panama Canal to American vessels engaged in the coastwise trade, be repealed. This recommendation Mr. Stimson makes on the ground that the legislation, as it now stands, will have the effect of putting an extra profit into the treasury of a special industry which already, by act of Congress, enjoys a monopoly and needs no further assistance. The Secretary of War urges that if it is not deemed wise to strike out this clause of the act, granting free passage to American ships engaged in coastwise trade, authority shall at least be given the President to withhold such exemption, in whole or in part until experience in operation of the canal may indicate the effects of such remission upon rates and traffic.

RAILWAY MAIL PAY AND THE PARCELS POST.

RALPH PETERS, CHAIRMAN, COMMITTEE ON RAILWAY MAIL PAY.

THE necessity of more liberal treatment of the railroads which was so strongly emphasized by Mr. Hill, in his recent address before the Railway Business Association, is clearly seen in the failure of Congress to provide, in passing the Parcels Post Bill which takes effect on January 1st, 1913, to make any provisions for additional compensation for the extra service. The rates for carrying the mail are fixed by contract with the railroads until 1916. The enlargement of the mailing privileges amounts in effect to a modification of the contract by the Government against the consent of the railroads.

The Committee on Railway Mail Pay which represents 268 railways operating 214,275 miles of line, in a public statement claim that the railways are underpaid for carrying the mail and that despite this fact the Postmaster General is not only seeking to have the present rates of pay reduced, but is planning to force the railways to transport without any compensation the enormous additional amount expected to be offered by the public under the new parcels post inaugurated January 1st. The carriers' statement further says: "The railroad pay is computed on the current rate of about eight cents per ton mile. According to the rate of 55 per cent allowed the railways in Great Britain, the railways' share of the $2.20 postal charge will be $1.21 as against only 13 cents in the United States. At present 11 packages weighing serially one to eleven pounds, or a total of 66 pounds, if sent by express in the first zone, 50 miles, would bear express charges of $3.05; the railroad's share on the basis of 47 per cent would be $1.43 while the express company

Digitized by Google

would retain $1.52. Under the new parcels post law, the same package would pay the government postage of $2.20, out of which the railroads would be paid 13 cents and the Postoffice Department would retain $2.07."

The Merchants' Association of New York has prepared a bulletin which attempts to show the extent of the savings to the shipper by the new postal regulations. The comparison is made with the rate on express service. In the first zone of the parcels post, or within 50 miles of the centre, the parcels post rates are lower than the present express rates on packages weighing less than ten pounds, but when compared with the new express rates, fixed by the Interstate Commerce Commission, there is no advantage on shipments over six pounds, and the saving on a six-pound package is only two cents, and on a five-pound package only five cents. For distances between 50 and 300 miles, including such points as Portland, Maine, and Richmond, Virginia, the parcels post rates are lower than the present express rates, but when the new express rates become effective the advantage will cease on shipments to Portland at four pounds and to Richmond at five pounds. In zone five, covering distances over 600 miles and up to 1,000 miles, the parcels post rates are generally lower than the present express rates.

A distinct disadvantage in connection with the use of the parcels post is the requirement that packages must be delivered at the postoffice. It is certain that the Postoffice Department will receive a large accession of business as a result of the new regulation of business. The advantages of the parcels post have been so clearly exploited that although the more intelligent and the larger shippers will continue to use the express companies, because of considerations of receipt, risk and convenience, the multitude of small shippers, especially in the rural districts, and the retail stores, as well, will take advantage of the opportunity offered them by the Postoffice Department.

With the lower express rates soon to go into effect, and with the improvement in service which the express companies will be forced to make, it is not an unreasonable prediction that so far from being injured by the new regulations the large extensions in the number of small shipments which will result from the new parcels post regulation will, in time, react to the advantage of the express companies.

RAILROAD DEVELOPMENT IN 1912.

THE statistics compiled from official sources and published in the *Railway Age Gazette* in its issue of December 28th, show that one has to go back for fifteen years, namely, to 1897, to find a year in which so small a railroad mileage was built as in 1912, and one has to go back six years, namely, to 1906, to find a year in which as large a number of locomotives and as large a number of freight cars were ordered. The marked increase in activity along industrial lines during the last part of 1912 is shown by the fact that between two and three times as many freight cars were actually built in 1912 as in 1911, and a third more locomotives were actually built in 1912 than in 1911.

The official figures for the number of railroad receiverships, number of railroad foreclosure sales and the amount of block signal mileage, all give indications of the same conditions that are illustrated by the extraordinarily small amount of new railroad mileage built and the very heavy orders for new equipment, namely, that capital is refusing to go into new railroad enterprises, and that the prosperity for the last half of 1912 is taxing existing railroad facilities heavily.

Notwithstanding the fact that 1911 was considered a very unsatisfactory year for railroad building, there was 3,066 miles of new track built in that year as against 2,997 in 1912. Forty-one states are responsible for this latter increase as there were five States in which no new mileage was constructed. The largest mileage was built in North Dakota, in which 347 miles of first track were built. Texas was second with 336 miles and Oklahoma third with 242 miles. No other state reached 200 miles of construction during the year, while the majority of them were well below the 100 mile mark.

The total number of cars and locomotives ordered during the year were divided as follows: Freight cars, 226,195, passenger cars, 3,623 and locomotives 4,424. These all show heavy increases over 1911, in the case of freight cars being nearly double what they were in that year. In fact, in no year since 1906 has there been such a large number of freight cars ordered. In that year the total was 310,315. One also has to go back to 1906 to find a larger number of locomotives ordered.

Twelve railroads with a total mileage of 3,762 miles went into the hands of receivers during 1912. These roads had a total funded debt of $106,964,854, and outstanding stock amounting to $74,493,643. The three most important roads among this number were the Pere Marquette, the Denver and Northwestern and Pacific and the Kansas City, Mexico and Orient, both of which latter were independent companies that had attempted to raise capital through appealing to private investors.

Contemporary Opinion

RAILWAY REGULATION

(From the New York Commercial.)

The salutatory to the annual convention of the National Association of Railroad Commissioners at Washington, was given by Hon. Charles A. Prouty, of the Interstate Commerce Commission. The trend of his remarks was full of interest and significance. The Interstate Commerce Commission has never been suspected of being too tolerant as relates to present railroad conditions, and still less so in dealing with railroads in the past. Commissioner Prouty's delivery for this reason was one to commend special interest

As a national problem, he pointed out that the United States was now in the position of controlling the railroads, owned by private capital, and held that in close restriction in many particulars by the public through its official agent, the commerce commission, so far as relates to interstate operation. What that body does in the larger relationship of railroads, the state commissions are charged with in questions of interstate importance. This binds them by a double set of checks and regulations. In both cases external power is or may be active even to the extent of making rates, should these be deemed unreasonable, or to the making of schedules. It is a tremendous power and the commissioner intimated that, injudiciously used, it might have an effect on the carriers which would be seriously detrimental to the country.

The United States, by its extraordinary growth in wealth and population, by its constant rescue of once waste territory from a condition of inutility to that of active production, is in urgent need of more railroads. Who, if our present railroad system is unwisely overloaded with harsh or unjust restrictions, will feel inclined to furnish private capital to fill the need? How can be found the requisite investment of money to extend, maintain, and further perfect the roads now in existence, or to construct the new lines which are becoming more and more exigent as problems of public necessity? If private individuals are frightened from taking the responsibility of those costly enterprises, who will do it and under what conditions can it be done?

That during the last two years there has been an extraordinary diminution in railroad building is indubitable. Yet this building must in some fashion go on. It is a very vital question, indicated Commissioner Prouty, and it must be solved within the next quarter of a century, on a solid and reliable basis, too, or this great nation would have to carry a crushing handicap.

Higher Expenditures and Lower Rates.

Referring to the current railroad situation, a prominent New York Financial House has the following to say:

"The possibilities for serious difficulties to the railroads as a whole have doubtless been exaggerated in their wage and rate situation of the past three years, but the expectations held, nevertheless, have eliminated a good deal of the buoyancy that might be expected in railroad shares and are probably in large part responsible for the fact that a number of the railroad shares, with sound earning power and dividends, have failed to reach market prices in 1912 equal to those of only 1911, not to mention previous years, despite the great increase in traffic and profits which are showing in the current fiscal year.

"It is estimated that if all the railroad employes of the roads classified as operating east of the Mississippi and north of the Potomac receive an increase in wages of the same proportion as that decided upon for the engineers, the total increase will amount to about $25,000,000.

"Yet for the same railroads the wage increase of 1910 amounted to probably $60,000,000, with the burden of which the railroads have two years following in which there was no increase in traffic. Should the present increase extend to all employes and amount to as much as the sum estimated the burden would not be comparable with that of two and a half years ago and could be largely absorbed in the great increase in traffic with which the railroad companies are now favored.

"At the same time it is, on the face of it, largely an imposition on the railroads to be compelled to bear an increased operating cost in the form of greater wage expense without any compensation except in the larger amount of transportation which improved facilities may make possible without a corresponding larger number of employes.

"The expectation that some assistance in the form of higher rates, unfortunate as this would be in helping to accelerate the circling tendency of higher costs generally, is very natural and must be considered especially from the standpoint of the railroads that are financially handicapped in securing economies resulting from improved facilities."

Rate Making.

E. Ireton, editor of the "Financial America" published in New York, in addressing the "Finance Forum." of that city, had the following to say in part regarding the effect of railway capitalization upon freight rates:

"Many are inclined to believe that the capitalization of a railroad company affects or is responsible in some way, for its freight and passenger rates. Railroads deny this and sound economists support them. Furthermore, the science of rate-making, if anything so empirical may be called a science, leans to the side of the carriers.

"If we view this question in a practical light we shall see the strength of the railroad's contention. If high capitalization could make high rates, all the railroads of the country would be capitalized on the same basis, which is not the case. For illustration: The Chicago Great Western, the Northwestern, the St. Paul and the Burlington all operate in the same territory. The capitalization of the Chicago Great Western is more than $100,000 a mile; that of the other roads about $30,000 a mile, on an average basis. Yet when we come to examine the rates charged by these roads, we find the Chi-

Digitized by Google

cago Great Western's the lowest. What does this prove? Simply that railroad managers endeavor to earn the highest returns possible, and that the Chicago Great Western believes its interest lies in charging lower rates than its competitors. Managers establish rates with no thought of capitalization, but simply to hold their traffic and obtain new tonnage.

"If we take the four great trunk lines between Chicago and New York: the Pennsylvania, the New York Central, the Erie, and the Baltimore & Ohio, we shall have a more convincing illustration of the fact that freight rates have nothing whatever to do with capital. The Pennsylvania and the New York Central have paid dividends regularly for many years; the Baltimore & Ohio has been reorganized at least once; and the Erie more than once in recent years. The latter has not paid a dividend on its common stock in years, yet the freight rates on all four systems to common points have been and are identical.

"The capitalization theorists proceed on the fallacious notion that the value of a property determines the price which can be charged for its use. The reverse of this is the truth: the value of a property is determined by the price which can be charged for its use. Hence, high or low freight rates have nothing to do with a railroad's valuation. Its estimated earning power alone can determine that."

The Panama Canal as a Wheat Route.

(From the Toronto Globe.)

That the opening of the Panama Canal may, and probably will, have a very disturbing effect on existing trade routes has always been regarded as a matter of course. Ocean-borne commerce can be carried on at a minimum of expense, but the voyage around Cape Horn has been too long and part of it has been too rough to enable that route to compete successfully with the transcontinental railways. The Nicaragua Railway afforded a means of shortening the ocean voyage, but at the expense of two transhipments. When the largest vessels are able to pass from one ocean to the other without breaking the bulk of their cargos a new element of potent influence will be introduced into traffic conditions.

New Light on the Canal Policy.

(From the Boston Transcript.)

The annual report made by Secretary of War Stimson, is in at least one respect the most illuming and important State paper of the new administrative year. He does not accept the Panama Canal act, or at least that feature of it providing for remission of tolls on American coastwise vessels, as an irrevocably closed incident, but recommends that consideration of it be reopened and tolls reimposed. In this recommendation he hardly takes the trouble to argue the question of the ethics of the situation. He bases his objections to our policy, so far as it has been outlined, on purely economic grounds. He has learned through expert investigation, set on foot by himself, that "a repayment or a remission of canal tolls is not necessary in order to enable American vessels engaged in coastwise trade to successfully meet such competition as they will be subject to either from the transcontinental railroads or foreign competitors." Notwithstanding the fact that they are at present paying at the rate of $4 per net registered ton over the Panama Railroad, a much larger rate than has been suggested as probable for the canal, their business "is rapidly increasing in volume and strength."

If that is so, and we have no doubt that the facts have been stated with a fair degree of accuracy, we stand in the position to-day of proposing to enter upon a policy of very doubtful propriety without even the plea of necessity in extenuation. On the other hand, such a system of gratuities would either make the other users of the canal pay higher rates or menace the ability of the Government to meet the cost of maintenance and the interest charges. In other words, we are likely to do an injustice to curselves as well as to foreign nations, the only result being an increased profit for those who are doing a profitable business already and one that will enjoy still further advantages as soon as the canal is open to operation. To insist upon this attitude under such conditions would be to lay a foundation for future trouble, because preparing a situation which the American public would not indefinitely endure.

The Responsibility for Poor Railroad Equipment.

(Baltimore News.)

The Interstate Commerce Commission's report to Congress, shows that out of 8215 derailments reported during the year, 5724, or almost 70 per cent., were caused by defective roadbed or equipment.

Such conditions may perhaps be explained by the fact that improvements in roadbed and equipment have not kept pace with the extraordinary increase in traffic and weight of trains. But this merely begs the question of responsibility. Are or are not the roads allowed to charge high enough freight rates so that they can meet all the growing demands upon them and still earn a legitimate return on their actual investments?

On the basis of their nominal capitalization remarkably few roads earn to-day an excessive amount of money; and in so far as their investments were based on older traffic conditions, rendered obsolete by the public, it is clearly the public's duty to allow them compensation for improvements. But despite the elements other than physical value which enter into the worth of a railroad company's securities, it would seem almost impossible to say on the basis of net profits alone whether sufficient such compensation is now being allowed, until a physical valuation of the company's properties has been made.

The railroads say they are not earning enough; the shippers say they are. Meanwhile, owing to the selfishness of the one or the mistaken contention of the latter, not enough money is going into the roadbeds and equipment to keep them in shape. The public has a decided interest in the correct placing of the blame.

Avoidable Railroad Wrecks.

(From the Chicago Record Herald.)

In a statement on recent railroad accidents, Interstate Commerce Commissioner Clark says:

Digitized by Google

"Most of the wrecks may be put in the class of avoidable accidents. Poor rails, speed craze and human negligence are the causes." He says the commission has made recommendations for safety, but it has no power to enforce them.

Intelligent railroad managers, of course, are anxious to avoid and to lessen the number of accidents. The leading roads of the country are now paying much attention to the rail question; new shapes are being brought into use on some lines; the question of chemical composition is being studied carefully; old rails are being replaced with new ones extensively in the rehabilitation now going on. Slower schedules have been made for the fastest trains between Chicago and New York, and it is probable that other "flyers" will be run at lessened speed in the coming winter.

Negligence will always remain a formidable cause of railroad wrecks. To minimize it is a problem involving more than safety appliances or disciplinary rules. The railroads should consider safety first, and the public should not demand the unsafe. The roads must lead in any change, and Commissioner Clark's statement should spur them to greater efforts. In any case, the Commerce Commission should be given greater power to enforce safety.

Waterways Versus Railways.

Dr. Harold G. Moulton has recently published through Houghton, Mifflin Company, the results of an exhaustive investigation concerning the relative value of the waterways and railways of the world. His treatment of the subject proved so excellent that he was awarded the Hart, Schaffner & Marx prize of $1,000 in 1911. Dr. Moulton points out that much of that which has been published in recent years concerning the value of waterways in comparison with railroads has been vitiated by the precedent point of view of railway men or the view of the advocates of the waterways construction. The conclusion reached by Dr. Moulton is that the railroad is in most instances cheaper and more adapted for modern transportation than waterways, with the exception of large rivers or great lakes, and that the present demand for building new waterways is not based on sound knowledge of the economic facts involved. The fact is brought out that if the Government constructs and maintains a waterway the taxpayer must pay for the same, the burden being merely transferred from one person to another. The burden of proof is certainly on the advocates of new waterways in the light of the decline of canals and the failure to use present waterways in this country. The work is an admirable presentation of a much agitated and debated question.

The State and the Railroads.

(From the Boston Transcript.)

From several sources, which the public is disposed to respect, there has come in the past fortnight the suggestion that a hopeful solution of the transportation problem in this State would be the acquisition by Massachusetts of the Boston & Maine Railroad. It is assumed that that would end the monopoly, so-called, and put the railroad business of this section upon a competitive basis. Unfortunately, the suggestion halts before it reaches the vital point of such a proposition. It is not certain, in the first place, that the State would find the ways greased for obtaining possession of the system. The greater part of the territory served by the Boston & Maine is outside the jurisdiction of Massachusetts. Would the other States consent, unless by the exercise of pressure which they would resent, to the placing of their transportation interests in the hands of this Commonwealth?

But supposing the first step could be taken without serious opposition, what would we do with our white elephant? We have undertaken to conduct a railroad business, in a previous generation, that was entirely within our jurisdiction, and were only too glad to escape from the responsibility with loss of both profit and prestige. Yet the situation in that instance was much simpler than it would be in the one proposed. Those who are pointing the way out of our troubles should do more than lead us a little way into the wilderness and leave us there without guide or compass for further progress. The State has responsibilities and burdens enough as it is without undertaking to regulate a situation that concerns all New England.

The factors in the problem, on the side of the public, are safety, speed, promptness of service and rates. On the side of the corporations are dividends and their right to make rates that would meet the increase in operating expenses. These latter have recently advanced faster than the concessions of the Interstate Commerce Commission, though there are signs that the latter is beginning to recognize the urgency, and perhaps in some cases the justice, of the demand.

Railroad Consumption of Iron and Steel.

(From the Iron Trade Review.)

The re-establishment of railroad buying upon a large scale furnishes further proof of the claim made in recent years that the railroads do not, in this age, consume nearly as large a percentage of the product of the iron industry as they did many years ago, when the railroads were being built and when the consumption of iron for other purposes was relatively limited. Railroad buying fell off in 1907, and was very small indeed in 1908. In that and subsequent years, there were those who were continually sighing for the "good old days," when the railroads consumed "50 to 60 per cent" of the iron industry's product.

Attention was then called to the fact that owing to great changes in conditions, such a proportion could never be restored. On the one hand, the railroads were built and would expand chiefly by way of increasing their facilities, while on the other hand iron and steel products had come to be used in a great variety of ways not thought of in the eighties, when the record railroad mileage was built. Railroad facilities, indeed, would not need to be increased largely, unless by an expansion in general business activity which would consume much iron.

Predictions are made that next year's rail production will break the record made in 1906, a trifle under 4,000,000 tons, but even if so, the total steel production will be very much larger than that of 1906, so that in any event the proportion of rails will be smaller.

Railway Valuation as Proposed in the Adamson Bill

By H. T. NEWCOMB,
Of the Bar of the District of Columbia.

H. T. Newcomb.

THE long mooted proposal for a Federal valuation of the properties of interstate railways has at last reached the stage that a bill providing for such a valuation has passed the House of Representatives by a decisive vote and is pending before the Senate Committee on Interstate Commerce. While, even though the Senate should favor the general idea involved in the Adamson bill, it would be premature to assume that it will become a law without important changes,—some consideration of the measure in its present form may be helpful.

The valuation contemplated by the bill is plainly not the so-called "physical valuation" which, in spite of manifold and inherent absurdities, for a while appeared to have won favor in the minds of those who have been most active in the recent extensions of the principle of public regulation. Instead of such an inadequate and unconvincing valuation, the bill directs the Interstate Commerce Commission to "ascertain the value of the property" used "for the convenience of the public," and proceeds to indicate recognition of organization, established relations with those in control of traffic, good will, etc., as elements of value by requiring the report to include the following five items, as to each "piece of property owned or used":

1. Its original cost for railway purposes.
2. Its cost to the present owner.
3. Its value to the present owner.
4. The present estimated cost of its reproduction.
5. The increase in value due to cost of improvements.

From the fact that the bill provides for an inventory of property and for the employment of engineers, as well as for a classification of physical property in conformity with the present accounting system of the Commission, it would seem to have been thought a "physical valuation" would be made as a preliminary to the ascertainment of the facts required to be reported. But whatever the nature of the process contemplated or carried out it is evident that when the Commission reports "Value to the present owner," it will report a fact not derived from or effectually controlled by the inventory values of separate elements of property. Before this report can be formulated, for any carrier, the value of its property as a whole will have to be ascertained and this ascertainment must necessarily be entirely independent of any previous inquiry concerning the separate value of the parts. In other words, if the Commission proceeds by the inventory method, it will obtain certain intermediate results which must be compared with the results of an entirely separate and distinct inquiry as to actual value in use. And in every case the former must be corrected so as precisely to coincide with the latter, no matter how extensive the correction may be. Hence it follows, that the inventory process is wholly superfluous, if the end desired is only that indicated by the bill. As the Interstate Commerce Commission well said in its first annual report, the value of a railway never depends upon its first cost or the correct cost of reproduction, but depends, instead, upon its organization; its location with reference to traffic, the competition to which it is subject, or, briefly, upon its past, present and prospective net receipts after paying operating expenses and taxes.

The valuation reported as the result of the inquiry now provided for is to be corrected from time to time whenever changes in the property or the conditions controlling its operation make correction necessary and the value ascertained by the Commission is to be prima facie evidence in all proceedings under the Act to regulate Commerce and amendments.

Doubtless this provision would make applicable to these conclusions of the Commission the same presumptions of accuracy that are now recognized in favor of the results of its other investigations when they are conducted in accordance with law. Such conclusions of fact are not final, in the sense that opportunity to overcome them is denied, but they are entitled, as evidence, to that special weight properly pertaining to the conclusions of an expert and experienced body especially created to make such inquiries. This is, of course, something more than is ordinarily intended by the term "prima

Digitized by Google

facie evidence," and should the valuation measure pass in its present form, the claim may be made that, as that term does not now appear in the statute with reference to the findings in an investigation of a complaint, it was not the intention of Congress to give equal probative force to the conclusions as to value. In the opinion of the writer such a contention would not be supported by the language or form of the Adamson bill as it passed the House of Representatives.

Some of the absurdities involved in the notion that railway property can have any other kind of value than that attributable to its earning power were brought out in the debate in the House. One member, who began his discussion by pronouncing in favor of the co-called "physical valuation," was plainly embarrassed when some one called his attention to the much higher cost of the Pennsylvania system's route between Baltimore and Washington, as compared with the route previously built and owned by the Baltimore and Ohio and to the further fact that commercial conditions require both lines to make the same charge to all patrons. His final answer involved the suggestion that it might be necessary to adopt "uniform standards of physical valuation for all railroads that were competitive," a suggestion which, explained by the context of his remarks, it is quite evident, would do away with the whole idea of inventory valuation.

The following quotation from a speech on the measure by Representive Mann, of Illinois, suggests a result of the inquiries which he is not alone in anticipating:

"The Illinois Central Railroad, which comes into the city of Chicago, along the lake front, with which most of you are familiar, came in over the lake bed and cost practically nothing at the time. The value of that right of way to the present owner of it amounts to millions upon millions of dollars now. It could not be replaced to the Illinois Central probably for $50,000,000.

"There is not a railroad in the United States, probably, passing through towns that have grown in size since the road was constructed where the present value of that property to the railroad company for its use does not excxeed not only the cost to the railroad company, but its capitalization, which it goes into and helps make up."

It is a serious objection to the Adamson bill, and one which the Senate ought to remove, even though it makes no other changes in the bill, that it imposes the burden of a new and extremely arduous investigation upon the already overworked Interstate Commerce Commission. By the enactment of the Hepburn law six years ago, that body was given duties and powers more extensive, difficult and important than those borne and exercised by any other governmental agency in the world, not excepting the Parliament of Great Britain, or the Congress of the United States. In 1910, the Mann-Elkins act multiplied its burdens at least by two. For two years, although the Commission has issued opinions and orders which no one believes to have had the actual and deliberate consideration of its members and although it has rarely sat as a body and has delegated most important investigations to its appointees, its docket has been crowded with cases far beyond its capacity, even by the methods indicated, to investigate and report. It is notorious, that it would be impossible for any one or two men even to read the mass of testimony annually taken by the Commission and its agents and there has been no contradiction of the assertion that it has been found necessary to entrust to clerical employees the exercise of many of the delicate duties and tremendously important functions which the law says shall be performed by the Commission. To a very large and increasing degree the statutory regulation by the Commission has thus become regulation by the employees of the Commission—that is by persons, who, however able and efficient, are not those upon whom Congress conferred these great powers or to whom the public or the railways could trace responsibility for acts due to misunderstandings of the law or the facts, or—if that should be possible—committed as the result of narrow and unjustifiable prejudices or even from improper motives.

The statement of these incontrovertible facts ought to be sufficient to establish the desirability of referring the long and difficult investigation proposed by the Adamson bill to a body of experts especially created for that purpose. To entrust it to the Interstate Commerce Commission is, in substance and effect, to entrust that body with authority to select other persons to perform the work and nothing more, for if the Commission were to undertake a more than nominal supervision of this vast inquiry it would have to abandon for a long period many of its other and regular duties. In other words, the alternative is between the appointment of a separate agency, the members of which would naturally be nominated by the president subject to confirmation by the Senate, which would have standing and dignity commensurate with the magnitude and difficulty of the work of valuation and the assignment of that task to subordinates of the Commission, who might be especially selected and qualified for the task.

Moreover, the Commission, capable as it is in many directions, is not qualified for the work of valuation, even if its other duties could be brushed aside so that it could be undertaken. The members of the Commission become by their experience, experts in matters of traffic and rates and practices affecting both, but not in the wide field of railway construction and finance. There is nothing in their duties to qualify them as experts in the problem of railway engineering or in those with which the financial departments of the railways are required to deal.

Any valuation of railway property must, plainly, be the work of engineers and of persons who are expert in translating current and prospective net income into terms of capitalized value. This is so obviously true and the investigation proposed is of such permanent and far-reaching importance that it seems strange that there could have been any other idea than to entrust it directly to a board composed of persons of the requisite attainments and of the highest professional standing. Any other course is unworthy of the Congress of the United States, as a body of practical legislators, and ought to be disapproved by the Interstate Commerce Commission.

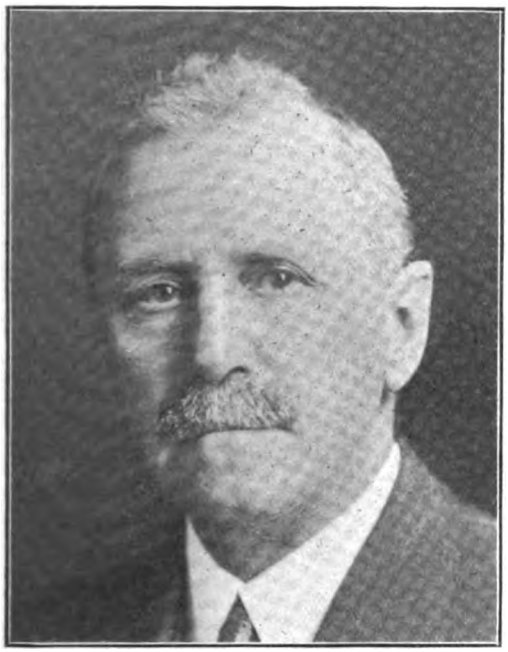
The Future of American Railways

JUST REGULATION OR GOVERNMENT OWNERSHIP.

By SLASON THOMPSON,
DIRECTOR, BUREAU OF RAILWAY NEWS AND STATISTICS.



SLASON THOMPSON.

THERE is nothing more important to-day than by education and the spread of ideas such misunderstanding (between different classes of citizens) shall be disposed and done away with, and that all Americans shall come to that spirit of popular government in which every American desires the prosperity and the happiness of every other American.—Senator Root before the New York Chamber of Commerce.

In the campaign of education, so essential to the prosperity and happiness of the American people, there is nothing more important than the enlightenment of the public mind as to the process by which the railways of the United States are being harassed and partially crippled in providing adequate, efficient and safe transportation. Through the enactment of the Act to Regulate Commerce (1887) and the Statutes supplementary thereto, the Interstate Commerce Commission has been invested with powers that make it the arbiter for good or ill of the fate of our railways, which at the present writing are still the private property of American citizens irrevocably dedicated to public use.

The strength and weakness of this form of railway regulation is that it bestows limitless authority with well-nigh absolute freedom from accountability. What the Commission says generally goes without "recall." It is invested with the widely divergent powers to investigate, to prosecute and to adjudge in all affairs relating to transportation by rail, and it has always resented any interference with its findings by the courts, not excepting the Supreme Court of the United States. Its findings of fact have become well-nigh unappealable. From its first organization the Commission has been composed of men of high intelligence, exceptional industry and, the writer believes, of truly patriotic intentions. But in the course of years, and with the extension of its authority, the attitude of its members has gradually fallen into a groove at variance with the principle enunciated by its first chairman, the late Judge Cooley, that "The Act to Regulate Commerce was not passed to injure any interests, but to conserve and protect. It had for its object to regulate a vast business according to the requirements of justice." It was his hope and expectancy that under the corrective rulings of the Commission "the management of the transportation business of the country ought to be and in time no doubt, would be restored to public confidence."

Judged by the trend of its decisions during the last decade and a half, the Commission has almost entirely lost sight of another principle formulated by Judge Cooley, that: "The railroads provide for the people facilities and conveniences of a business and social nature which have become altogether indispensable, and the importance of so regulating these that the best results may be had, not by the general public alone, but by the owners of railroad property, also, is quite beyond computation."

Sympathetic as well as wise and just regulation of this "indispensable" industry was always present in the minds of the early administrators of the Act to Regulate Commerce. By almost imperceptible degrees let us see how far it has altered both in disposition and terms. The chief physical, financial and operating condition of the railways under the chairmanships of Thomas M. Cooley and the Hon. Chas. A. Prouty can be briefly summarized and contrasted in table found at top of following page.

It is not germane to the purposes of this paper to comment on this remarkable exhibit of the development of the "indispensable" railway industry during the period of its regulation by the Interstate Commerce Commission, further than to say that it has been achieved by economies in capital expenditure, in road equipment and management that are the wonder of foreign experts and that have finally reached the limit of adequate service and safe operation. The capital investment shown in this statement is exclusive of over $2,000,000,000 that has been expended on additions and betterments out of income and many more unidentified millions that have gone into the plant through operating expenses.

It is because the railways have reached the limit of absorbing all the increased costs of operation and of regulation by economies, that have made the above exhibit possible, that the time is ripe to call upon the Commission to

drop the role of prosecutor and join hands with the railways in rehabilitating the transportation industry on a basis of just and adequate rates. The Commission does less than half of its duty when it guards the public from illicit, unequal and unreasonable railway rates, or any other illegitimate and unlawful practices. The major part of its duty, within the powers it now possesses, should consist in so regulating the railways that they may fulfil the myriad transportation requirements of a continent peopled by the most exacting travelers and traders on the face of the globe. That this is impossible on the present scale of freight rates and railway mail pay co-incident with higher wages and dearer supplies, does not admit of question. "Hitherto," as the "New York Herald" recently said: "the Commission has dealt with the railways as if it held a brief for the shippers." This has grown out of a condition foreseen by Judge Cooley when he wrote: "There is a sense of incongruity between the prosecuting function, involving as it does detective methods and an attitude of hostility, and the judicial function, rightly expected to require impartial and just investigation and decision of controverted questions of law and fact." As prosecutions have become incidental to railway regulation, it is only proper that the attorneys for the Commission should sit, at least half of the time, on the railway side of the table. Unless the transportation needs of the public are given precedence over the selfish pleas of shippers in railway hearings, the situation must become so intolerable both for the railways and the public that a remedy will be sought in government ownership and operation, when fares and rates and regulations will be adjusted to expenses, improvements and fixed charges or the inevitable deficit will be made good by general taxation.

You take my house, when you do take the prop That doth sustain my house; you take my life, When you do take the means whereby I live.—Merchant of Venice.

Let us look the facts in the face. What are the props that sustain the railways of the United States; the means whereby they live? Their sole means of living, to do the fetching and carrying for a people growing at the rate of a million and a half a year, is the revenue from four sources, in the following proportions:

For carrying freight	70	per cent
" " passengers	25	" "
" " mail	2	" "
" " Express	3	" "
Total	100	per cent

Roughly speaking, these ratios have persisted through the years of regulation except that the proportion from freight has been generally under 70 per cent., and the order of those for mail and express has been reversed, mail which now yields under 2 per cent. of all railway revenues has at times been over 3 per cent.

These four sources, speaking generally, are the sole "props" for the maintenance, operation, improvement and extension of the 250,000 miles of railway that by trunk lines and thousands of smaller branches extend into every quarter of the republic. There are still remote corners crying for rail facilities. When the sum of the revenues from these sources becomes inadequate to pay operating expenses and taxes, to take care of depreciation and obsolesence, to provide facilities in advance for increased traffic and a reasonable return for the value of the property, then the railways must deteriorate and finally fail to meet the requirements of the public for whose social and industrial welfare they are indispensable. Like a tree, when the railways cease to grow they begin to die.

During the past ten or fifteen years what has the Interstate Commerce Commission done to preserve the railways from deterioration through lack of nourishment? Where has it stood for the industry committed to its keeping against the assaults of every selfish interest that has seen fit to prey upon it?

Railway Dependence on Freight Rates.

Take the case of freight rates from which over two-thirds of railway revenues are derived and which admittedly bear the burden of unremunerative passenger, mail and express rates. It is an undisputable axiom that there is no American freight rate which is unreasonable high per se. It is equally indisputable that the average of freight rates in the United States twenty years ago was low, unreasonably low, lower than those then or since charged by any of the railways in the principal countries of the world. Moreover the wages paid by the railways of the United States twenty years ago were at least double those paid in any European country, and they have more than retained that disproportion.

A glance at the table given above shows what has happened to American freight rates since 1889. Under the persistent hammering of shippers, and rival communities, by 1899 they were gradually forced down to 7.24 mills per ton mile, without the Commission interposing a warning remonstrance. On the contrary, when the railways sought to check the ebb of their

Digitized by Google

revenues by a slight advance, the Commission led the assault that resulted in its being invested with authority to fix (i.e., reduce) rates. Since 1901, the average of freight rates has remained fairly steady around 7.5 mills per ton mile. But this has been due almost wholly to the fact that as traffic becomes denser it becomes more varied, and articles that yield a higher rate increase slightly in proportion to the total tonnage. Had it been otherwise the level of the average freight rate must have yielded to the uninterrupted line of the Commission's decisions declaring existing rates unreasonable and ordering reparation and reductions. Out of 942 formal decisions handed down by the Commission in the three years 1909, 1910 and 1911, no less than 573, or over 60 per cent., granted reparation or reductions, and not one adjusted a disputed rate by advancing the lower rate. The difference was never split in favor of the railways. In one decision in 1911, the Commission laid down the rule that it was "without power to order an increase in any rate." In another noted case, interstate rates into Texas were forced down to prevent discrimination as compared with lower intrastate rates fixed by the Texas State Commission. Throughout all these decisions and thousands upon thousands of informal and reparation orders one increasing purpose seemed to run—the deflection of railway revenues.

It only remained for the passage of the Mann-Elkins Act (1910) to place the freight rates of the railways completely at the mercy of the Commission by investing it with power to suspend and prohibit any or all advances. Exercised with anything like a wise and broad appreciation of the vast interests involved, this authority was necessary to the effective regulation of the railways as public utilities. But in the celebrated cases in which the railways merely sought to advance rates sufficiently to take care of a liberal increase in wages, the Commission made little pretense of a judicial or open mind. Its counsel sat cheek by jowl with the attorneys for the shippers and assisted in every way in prejudicing the investigation adverse to the pressing needs of the railways. All sorts of irrelevant evidence was heard and Mr. Brandeis, of Boston, with as much practical experience of railway operation as a crowing rooster has of laying eggs, was permitted to exploit his million-dollars-a-day economy proposition without an explosion of ridicule and contempt from the Commission that would have pricked the dazzling bubble as it issued from his versatile lips. The Commission listened to reams of immaterial testimony of over-capitalization, watered stock and misdeeds of manipulators a quarter of a century old, and finally concluded that the railways did not need the advance they sought. Commissioner Lane in his opinion cited as proof that the railways as a whole had never before prospered as they did in 1910, that "the actual amount paid in dividends (that year) had increased to $405,000,000."

This brings us up against the fact that throughout its existence the Commission itself has been misled and deceived by its own statistical bureau. "The actual amount paid in dividends," as stated by Commissioner Lane, was predicated on an exhibit presented by the Commission's attorney, for whose use it was prepared by the Commission's bureau of statistics.

The final printed report of that bureau for the year ending June 30, 1910, shows that this fictitious exhibit of the prosperity of the railways in that year was composed of the following items:

Operating Roads.	
Dividends from current income	$283,411,828
Dividends from surplus	67,790,444
Lessor Roads.	
Dividends from current rentals	35,788,530
Dividends from surplus	18,674,561
Total	$405,665,363

So it appears from the Commission's own official report that dividends from current income in 1910 amounted to only $319,200,358.

Nor is this all. It further appears that the current income from which these dividends were paid was swelled by no less than $202,473,512 received by the operating roads in dividends and interest paid on stocks and bonds owned by the railways themselves. Of this $111,828,500 was included in the $319,200,358 dividends from current income. Further analysis of the income account of the railways for 1910 shows that considerably less than $200,000,000 of the $405,771,416 paid in dividends that year were derived from transportation revenues. The remainder consisted of duplications due to intercorporate payments, which for eighteen years have vitiated all the Commission's statistics and lent a fictitious color to the spectacles through which it has been wont to take an exaggerated view of railway profits.

If in 1910 the railways had been able to pay $405,000,000 or $305,000,000 in dividends of our current revenues from transportation, the Commission would have been fully justified in forbidding advances in freight rates without a hearing. But it lent an over-credulous ear to the shippers and its own misinformed attorney.

The Passenger Rate Situation.

Next in importance to freight rates as a source of revenue come passenger fares. It will be admitted that passenger traffic should be self-supporting. But on a majority of American roads passenger traffic is so sparse that it scarcely pays its share of the cost of operation. This brings about a condition where the freight rates have to pay a portion of the freight for carrying passengers, which Commissioner B. F. Meyer, when Railway Commissioner in Wisconsin, declared to be "a species of piracy," especially as "Low freight rates are vastly more important to the people of the State than low passenger rates." In that case the Commission, after an exhaustive inquiry, much as it was inclined to a two-cent a mile maximum, was constrained to establish two and one-half cents as the limit.

Six years ago a wave of two-cent per mile passenger fare legislation swept over the States, irrespective of whether the conditions justified it or not. Wherever subjected to judicial investigation, these statutes have been condemned on the ground of their confiscatory nature. Moreover the statistics of the Interstate Commerce Commission showed that between 1907 and 1909 they had reduced the average receipts of all the railways of the United States from 2.014 cents per passenger mile to 1.928 cents. Negligible as such a fractional decrease may seem, it cost the railways over $3,000,000 in passenger receipts in 1910 and shifted just so much more of the burdens of operation, taxes and charges

Digitized by Google

to the freight rates. Accompanying this two-cent a mile legislation the popular demands for improved passenger service in the matter of stations, cars, conveniences, speed and safety were insistent and imperative.

Nowhere has the Interstate Commerce Commission shown any disposition to protect railway revenues from State passenger fare legislation that imposed heavier burdens on freight rates, and was calculated to force the railways to exhaustive and uneconomical economies.

Mail Service a Drain on Railways.

No part of the passenger service is so exacting in its demands, so palpably inadequate in its pay, as the carriage of the United States mails. It takes precedence of every other service. The government prescribes the most minute details of its operation. It specifies the equipment to be employed. Postal cars built according to government specifications have doubled in cost during the past fifteen years. The mails go by the fastest trains and the special mail trains which leave at the convenience of the postal authorities have the fastest schedules and are given the right of way. All other traffic, freight or passenger, is side-tracked to make way for Uncle Sam's flyers. Floods, tempests and snowslides may delay, they must not stop the mails.

Twenty years ago railway mail pay was insufficient to meet the cost of the service, which was cheerfully performed from mixed considerations of public duty and self protection. Twelve years ago a Congressional Commission, after exhaustive hearings covering two years, reported that "the prices now paid to the railroad companies for the transportation of the mails are not excessive." Between 1890 and 1911, the railway receipts from passengers increased 153 per cent., from freight 170 per cent., from express 249 per cent., and the government receipts from mail increased 291 per cent. In the meantime, although the amount of mail matter transported increased 296 per cent., railway mail pay increased only 117 per cent.

In 1910, the Postoffice Department paid the railways only $48,913,888 for the transmission of the mails, although the Department's own estimates placed the cost of the service to the railways at $34.125,167 for 194,567 miles of line, or pro rata, $37,878,934 for all mail carrying lines, exclusive of $18,000,000 for interest on property devoted to mail carriage; $10,746,157 for "working space"; $3,300,000 for erroneous basis of dividing expenses; $5,000,000 error from selecting November as typical month on which to base computations—making in all a total of $74,925,091, or $25,011,103 more than the sum received. This calculation takes no account of the unjust method of ignoring the growth of the service between the quadrennial weighings on which annual payments are based or any fares for departmental officials transported free.

Although the loss of over $25,000,000 has to be made up out of transportation revenues from other sources, presumably freight rates, there is no record of the Interstate Commerce Commission interposing any remonstrance against what Commissioner Meyer might well characterize as "a species of governmental piracy."

Decreased Revenues from Express.

In its recent inquiry into express rates the Commission has shown a disposition to view the subject of their reduction as something apart from other railway revenues.

Although the express business has come under the supervision of the Act to Regulate Commerce solely as correlative to the transportation of freight by the railways, and although more than half the gross receipts of the express companies (approximately 55 per cent.) is paid under contract into the railway treasuries, the Commission refused to permit the railway representatives to intervene or become parties to the hearings.

Last year the railway percentage of the express revenues amounted to $70,725,137. If, as has been suggested, the express rates ordered by the Commission should cause a reduction of 25 per cent in their receipts, the effect would be to decrease automatically railway revenue by approximately $17,000,000 without in any way providing for a corresponding curtailment in the extent or expense of the service. Here again the freight rate will have to pay the freight.

Net Revenues and Railway Safety.

While the public may view with equanimity the decreasing margin between railway revenues and operating expenses as chiefly the concern of bondholders and stockholders, it will not long tolerate any failure of the railways to meet the demands for improved facilities and safer service. If ever the public comes to realize that low rates mean stagnation in railway development by clogging the springs of fresh capital, and that eventually low rates beggar the railway that makes them and the community that takes them, and that economies in operation can be carried to a point where they cripple and endanger the service, then the public is likely to be heard from.

To-day we have approached perilously near the point where enforced economies sap the vitality of the railways. Before the clamor of selfish shippers and unprincipled demagogues, the railways have been driven to ruinously low rates and unsafe economies. How does the public suppose the railways hitherto have met this sliding scale of freight rates downwards? What does it suppose accounts for the increase of 50 per cent. in the weight of locomotives and 100 per cent. in train loads since 1898?

They represent the strain on railway management to meet increased wages, dearer materials, higher taxes and heavier interest charges, with bigger and more powerful units of operation. Road beds, rails and facilities have been improved to correspond. But the limit has been nearly if not quite reached.

No problem gives greater concern to conscientious railway managers than the apparent increase in casualties from operation due to two items—broken rails and defective wheels. They know—and if they did not a child could tell them—that these follow, as the night the day, the introduction of gigantic locomotives and enormous train loads. No rails milled by human skill can withstand indefinitely the multiplied impact of the railway equipment required to meet the burden of costly regulations and unremunerative rates. If the margin of safe operation has already been passed, regulation that requires the railways "to make bricks without straw," is responsible. Broken rails and defec-

Digitized by Google

tive wheels are by no means the only alarming symptoms of the pernicious economies forced on American railways by low freight rates. Automatic immunity from accidents and indestructible cars are the vagaries of theoretical visionaries. With every increase of weight and speed the units of risk are increased in a greater ratio. If British and continental railways are comparatively freer from fatalities in train accidents than ours, it is because their high freight rates permit economical operation with equipment lighter than ours was twenty years ago.

Railways and the Cost of Living.

In the "American Magazine" for December, from behind the barriers of her physical infirmities Helen Keller, the mental triumph of our age, exclaims: "When I heard that locomotives had doubled in size and speed, I thought, 'The food of the wheat fields will come cheaper to the poor of the cities now,' and I was glad. But flour costs more to-day than when I read of those great new engines. Why do not improved methods of milling and transportation improve the dinner of the poor?"

Indeed, why? The answer is that the shipper and other middlemen engross every benefit that should inure to the advantage of all from milling and transportation improvements.

Does milk, the universal nourishment for all ages, cost more to the consumer to-day than twenty years ago? The railways have not added to that cost, for they are carrying milk for less to-day than then.

Do meat, eggs, butter and cereal products, that form the bountiful diet of the best fed people on earth, cost from 30 per cent. to 60 per cent. more to-day than twenty years ago? The railway rates on all of these are less than they were then.

Does the price of every article that enters into the cost of living, whether the product of the mine, the farm or the factory, average more than 30 per cent. more to-day than twenty years ago? The average receipts from all these commodities carried by the railways has added nothing to that price, for it is 18 per cent. less to-day than it was in 1892.

The larger engine of which Helen Keller has read has done more than its share to improve the dinner of the poor and to keep down the cost of living to all. But it has reached the limit of its capacity to absorb the margin of financial security and physical safety in railway operation under regulation that is deaf, dumb and blind to conditions that he who runs can read. It was a condition and not a theory that was presented to the Commission in the advance rate hearings in 1910. That condition was accentuated by the shrinking net income reported for 1911. It has been further emphasized by the bewildering report of the Engineers Arbitration Board last November. This not only grants advances, in some instances running as high as 30 per cent. and over, but establishes a minimum rate above the average daily pay for the territory involved three years ago and two and one-half times the actual average pay of British engine drivers. It accepts the misleading statement of Commissioner Lane above referred to that "the actual amount paid in dividends had increased to $405,000,000" in 1910. Its minimum ignores the dissimilarity in the traffic service and surroundings in the vast territory from the St. Croix to the Wabash, as well as between large and small roads. And finally it leaves the railroads unable to pay an increased compensation—to open again the question of an increase of rates with the Interstate Commerce Commission, which is an impractical suggestion for the poorer roads as their rates already average higher than those of the stronger roads.

Conclusion.

Much more could be added to this exposition of a situation that calls for the Interstate Commerce Commission to temper its regulation of the railways with a more generous utilization of its powers in the interest of the great industry upon which the entire fabric of our social and commercial progress depends. It is up to the Commission to promote "that harmonious union, that magnificent concord of all interests, of all classes, on which our national greatness and prosperity depends," or by adherence to the constrictive policies of the past, to bring stagnation and bankruptcy not only upon the railways but upon all the internal commerce and industries of the United States.

Hovering over the situation is the paralyzing alternative of Government ownership, with its bureaucratic extravagance and inefficiency, its "insolence in office" and its concealed deficits made good by general taxation.

The Outlook as Viewed by Prominent Officials.

Howard Elliott, president of the Northern Pacific has recently expressed himself as satisfied with the general business and trade conditions in the northwest and expects a continuance of favorable traffic gains on the lines over which he has control. While he does not look for a so-called "boom" in business, he sees no reason to anticipate a slacking in general trade.

F. B. Yoakum, chairman of the Board of the Executive Committee of the St. Louis and San Francisco Railroad Company, states that: "All basic factors that make the stability of the nation are in evidence in all sections, with the manufacturers all over the country excusing themselves for not being able to get the raw material fast enough to fill orders promptly. The material supply companies complaining of insufficient cars to handle promptly the coal, coke, lumber, pig iron, etc., does not look like a sufficiently distressing condition to make us feel that we are going backward instead of forward."

James J. Hill, in discussing conditions in the northwest has had the following to say:

"Never in my fifty-seven years of experience in the Northwest have I seen the outlook more promising for general all around business. This estimate applies especially to the crop outlook, but upon crops, of course, depend all the business fabric of the Northwest. Jobbers and retailers are doing all the business they can handle. Present conditions are quiet but there is a strong foundation of cheerfulness over the 1913 promise. Weather conditions for fall sowing have been very favorable."

In referring to the "Physical Value of Railroads" bill, Mr. Hill is quoted as saying that any fair valuation of the railroad properties in this country could not fail to show a valuation far in excess of their capitalization, which he affirmed is the lowest in the world.

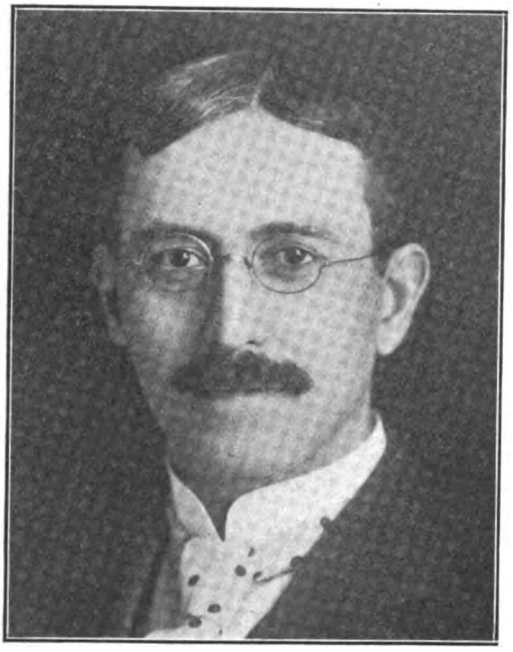
Department of Maintenance of Good Will

By FRANK W. NOXON,
SECRETARY, RAILWAY BUSINESS ASSOCIATION.



FRANK W. NOXON.

THE up-to-date railway manager in the United States must sometimes suspect that the public under whose manipulation, he has come, is as innocent of sympathy with him in his troubles as that barber met by Arnold Bennett, the English writer, during his recent American sojourn. Mr. Bennett inquired: "Why do you bump my head about so?" "Why not?" demanded the artist. A still more exciting adventure is related to have happened to a martyr who, in accordance with the institutions of his age and clime, had submitted himself to correction at the hands of the public hair abbreviator. He suddenly exclaimed, " Have you cut a piece off my ear?" Whereat the wielder of shears and power replied without agitation: "Yes, sir; but I don't think the hearing is affected."

It is no doubt a strain upon the transportation executive to avoid the conviction that his public chastisers, official or otherwise, view him as one whose substance can be hewn away with frolicsome gaiety and pleasing infliction of pain and yet without interruption to the functions. Some months ago a number of delegates to an international trade organization were discussing the obligation of shippers in the matter of helping to conserve railway credit. A Canadian member was appealed to as an impartial umpire and remarked: "I think the railroads can take care of themselves." This from a gentleman of whose country Chairman Prouty, of the Interstate Commerce Commission, recently said:

"There is hardly a railroad in the whole Dominion of Canada to-day, long or short, built by private capital, which has not received a subsidy, and usually a subsidy in money."

If the Canadian delegate had subtlety and meant to imply that the subsidies are themselves evidence of the ability of the Canadian railroads to "take care of themselves," his observation can hardly apply to conditions this side of the forty-second parallel; for nobody who knows Washington would spontaneously combust with thoughts of treasury grants to common carriers. Other aspects of the transportation problem would tend to exclude from Congressional consideration such a project even if any railway manager were to petition—which is unlikely.

The other delegates concurred with their Canadian colleague, and it is generally true that the hardest thing encountered by anyone solicitous for the welfare of the roads in the effort to establish a public belief in their need of more liberal treatment as to revenue is the public impression that railroads have at least as much money as they deserve, and can somehow find plenty more no matter what happens to them.

The Necessity for Studying Facts.

With this in view the railroad managers began a few years ago to study how the public might be induced to study facts rather than oratory and employ in studying the resources of the railroads, vast and all-powerful as they look, the same balance sheet method which they would use for a corner grocery. Valuable devices of presentation and machinery of conciliation have been developed. These range from the readiness of the executive to deliver simplified addresses full of facts and free from bitterness, to the appointment, as recently reported by an Eastern system, of an officer in charge of public relations. This last, it might perhaps be said to all railroad presidents, "is the machine you will eventually buy."

The railway president in a large number of cases now embodies in his own person the desire of the company that " the public be pleased." He is anxious, like Cassius, when taken to task by Brutus, to soften a situation where all his faults are "observed, set in a note book, learned and conned by rote, to cast into my teeth." He hopes to divest himself of the old aspect of stiff-necked royalty, or, if people on the line persist in thinking of him as ruler of a long and narrow empire, to resemble in their eyes the German Kaiser, who moves about among the people to learn their needs. Dr. Andrew D. White told me that when Ambassador at Berlin he talked with Wilhelm II, who had been criticised for traveling about so much. "Why," exclaimed the Emperor, "that is my job!" It has come to be regarded as the "job" of the railroad president to get acquainted with the population by constant contact with them, thus dispelling from their minds the mirage of an unapproachable superman and also learning what they are thinking about in connection with the property which he administers.

Digitized by Google

Getting in Touch with the Public.

It was my privilege some time ago to read the manuscript of an address which an eminent transportation executive was to deliver. It had for several years been part of the work of the Railway Business Association to talk and correspond with hundreds of shippers in every part of the country. The most striking quality in that address was the accuracy with which the author of it had selected for his topics the phases which I have found uppermost in the minds of skeptical or unfriendly shippers and the directness with which he set forth just what they had told me they wanted and needed to know.

The natural inquiry is whether the visit of the president to a town on the line is not limited in its effectiveness somewhat like the religious revival. How about the let-down? This is a serious problem. It is not enough that the spirit of concession and co-operation shown by the president wins a certain degree of good will for the road, and that the local representatives reap an advantage from this and from the opportunity to imbibe the same attitude. All this may be partly or wholly undone, conditions may at last be worse than at first, if the local voice of the corporation lacks authority and instructions to transact business from day to day to the reasonable satisfaction of shippers, or if for one reason or another he does not develop himself more than previously as a citizen, a neighbor among neighbors.

Some of the roads have within a few years endeavored to guard against this tendency. Authority, for instance, of the local agents, or of certain grades of agents, has been increased in the matter of claims for damages by raising the limit of the amount to which a claim may be settled on the spot without reference to the claim department at headquarters. This change involves some danger of abuse, and the Interstate Commerce Commission has become very strict in requiring its examiners to apprehend payment of unjust claims; but it is the aim to select carefully the individual railroad agents to whom such authority is delegated, and the result seems to have been valuable in elevating the local representative in the respect and good will of his public. It may almost be said that good will or ill will for the road is largely determined just at this crucial point of contact between the shipper at the outlying station with the local railroad agent.

On the social and civic side there is an opportunity in every community for the railroad agent to increase his stature and accumulate friends for himself and for his company. He joins the Chamber of Commerce and interests himself actively in some branch of its work having perhaps no relation to his own. He belongs to clubs. He comes to move unmarked like other men among his neighbors, a good fellow whom they know in himself and for himself, a reincarnation of that railroad manager of the earlier days on the short road, who knew everybody on the line, held the esteem and affection of all, was credited with the best of intentions, and was generously forgiven if now and then he proved, like his fellows, that it is human to err.

The tendency to decentralize management on large systems has such purposes in view quite as much as efficiency in operation. The headquarters officer in charge of public relations would have on every division what Lincoln called Dana—"his eyes at the front"; and every outbreak of public resentment at any point would invoke straightway the concentrated facilities, talent and experience of the system for wise and broad treatment.

The Press and the Railroads.

A revolution has in recent years been wrought in the attitude of the railroad company toward the press, particularly in the manner of accidents. It is now practically universal practice to furnish prompt, frank and full information to the papers whenever there is a collision or derailment. With regard to the financial condition of the roads information is now made regularly available by the Bureau of Railway Economics, maintained by the railroads as a whole at Washington. This bureau is unique among agencies of the sort in that, so far as I know, it has never drawn a conclusion or pointed an argument in connection with the facts which it makes available to press and public. The point is to let the public draw its own conclusions from statistics reduced to sufficient brevity for consideration by busy men.

Fruitful Efforts.

It has been one of the delights of the Railway Business Association, now a little more than four years old, to observe in the course of efforts here and there in many States to promote conciliation between the public and the roads, that as the months wore on instances multiplied where the growing spirit and practice of closer touch with the people by the railroad managers had sweetened the air, converting suspicion and resentment into confidence and co-operation. Without the subsidence of controversial feeling brought about by the development of this railroad policy and method it would have been out of the question for the Association which I serve to obtain as we did obtain during 1912, the signatures of 4,000 shippers in nearly every State of the Union to a declaration expressing solicitude for the financial condition of the roads and a desire that the Government should permit such earnings as would foster railway borrowing power.

The railroads cannot "take care of themselves," because the Federal Government has assumed control of their charges and largely of their expenses, without taking over responsibility for their financial vigor, while the Interstate Commerce Commission is characterized by such incorruptible integrity that no railroad manager would think of seeking to exert an improper influence upon that body even if he felt tempted to find in that way an escape from his perplexities and anxieties. But the railroads are persuading the public to take care of them with much keener solicitude than in the past by getting acquainted with the people, finding out what they are thinking about, meeting so far as feasible their desires, and constantly letting them see that it is their own interest to favor efficient roads and to advocate public policies designed to strengthen railway resources and credit.

The People and the Railroads

By C. D. KELLOGG,
SECRETARY, THE AMERICAN RAILROAD EMPLOYES' AND INVESTORS' ASSOCIATION.

C. D. KELLOGG.

IN writing on subjects affecting the railroads of our country, one is so impressed with the vastness of the interests involved, the evident hostile tendencies at work against them, the necessarily insurmountable obstacles in the way of adequate refutation of present public sentiment, and a feeling of impossibility to appreciate the conditions in which the railroads finally will be placed, even if the present flood of adverse legislation backed by this public sentiment grows no worse, that one is likely to be extreme in his use of condemnatory expressions.

It is not necessary, in this time and generation, to expatiate in glowing terms upon the stupendous influences railroads have had in the past upon our civilization and advancement, nor what they will exert in the same direction in the future, if their work is not unnecessarily hampered and their faith deadened. These attributes of christianizing and fulfilling the destiny of the American nation probably are understood fully, even if not fully appreciated, by the great majority of thinking people. This part being acknowledged, then it should be easy to try and be fair to each other in all business relations, of one sort or another, and then the railroads would and will have no complaint to offer. The great trouble is that there is so much loose thinking on these big railroad problems, and so many panaceas advanced by those who know little, or nothing of the intricate difficulties confronting railroad operations, that the public has come to believe that the railroads really could be run better by most anybody else than by those operating them.

It may as well be admitted at the start and in partial palliation of the present hostility, that in former times the railroads did things to the public not sanctioned by fair business ethics. But are the entire proceedings of all big business houses absolutely above reproach? In very truth, to what great business enterprise can you point in which fewer and less vicious or objectionable features entered than into the construction, progress and management of American railways? They make the assertion that in the railroads there has been much watered stock. Possibly that is so, but was he not a brave man, yea, a visionary one, who risked his money in a railroad that was builded into the wilderness, or out on the trackless plains, among sagebrush, buffalo and savages, where there would not seem to be any prospect of a return upon his investment in a generation or a lifetime? Where is the man, even now, who would do a thing like that? Moreover, if this watering, as they call it, had not been done, would it not have delayed for a generation or more the building up of the western country, and the upgrowth of the great and magnificent cities of the west, the civilization, homes and Christianity? Railroads of to-day should not be judged by those old standards and ways. In those old times they did largely as they could—not as they would. They were in every sense pioneers, and as pioneers they had to work.

It is to be observed that the public charges all these shortcomings to the railroads, and absolutely absolves itself from blame, or responsibility. But, in justice and fairness, is that so? Let us see. One of the greatest sources of evil charged to the railroads in the past was that of rebating. Political spellbinders and office holders dinned and dinned this into the ears of the public on all occasions, not giving their hearers time to think that it takes two to make a finished rebate bargain—nor has it ever yet been demonstrated successfully why a rebate giver is any worse, or more to be condemned than a rebate taker. Indeed, in times gone by, there were many instances when the rebate giver had little or nothing to say in the matter—the rebate was simply forced on him, or a condition perilously near bankruptcy stared him in the face. Then, too, in former times, a form of wholesaling in railroad rates was regarded as just as ethical and as much in line with fair business procedure, as a merchant, then and now, regards it—the man who buys a carload or a trainload of merchandise from a manufacturer expects to buy, and does buy at a lesser price than the man who buys a quarter carload—why, then, should not the railroads have a wholesale rate? The government has said "No," regardless of the lack of logic in the command.

The great difficulties the railroads have in reaching the public with their side of the story is responsible for much of the erroneous public sentiment against them, and probably also for much of the unfair legislation from which they suffer. For instance: a farmer in "Pleasant Valley" goes to town and buys a pair of shoes for five dollars, and when, eight or nine months afterwards, he wants to buy another pair, just

Digitized by Google

like them, he is told the price is six dollars. After demanding a reason for this, he is told the railroads have raised their rates and, therefore, he has to pay more. Inquiry at the railroad office may show that the rate on shoes actually was reduced during that time, but the damage to the railroads is done; the farmer goes back, circulates the story among his friends and any attempt after that at refutation of it, or of setting him and his friends right is not only a useless, but, generally speaking, an impossible thing to do. Furthermore, it is shown very easily that the railroad rate on the ordinary and general articles of consumption by the public has no appreciable effect on the price the public pays for these commodities. The raising of the rate at once would be charged to the consumer by the dealer and the lessening of the rate probably would act in the same way, or, at least, it would not bring a reduction from the dealer.

The great hue and cry of spellbinders and would-be economists is that if proper economy were practiced by the railroads, they would still be in a position to make large percentages of revenue from the operation of their lines. This assertion sounds good to the public and reads well in the newspapers, but, when all is said and done, great economies in railroad operation which have taken place in the last few years have been borne by the part of the public least able to afford them; that is to say, the railroad employes. These chair-warming economists who prate learnedly of what economies the railroads might practice, if they had a mind to, do not take into consideration that the reduction of grades, straightening of curves, and the increase in the motive power of the railroads ultimately falls on the men who absolutely stand between the public and the managers of these great properties. In the last decade or two the motive power of the railroads has been increased to such an extent that where formerly three or five crews were necessary, to do the work, the same, or more work now is done by two or three crews. These conditions have been forced upon the roads as the only means by which they can withstand the assaults on their earnings made by government and other commissions. Installation of safety appliances and safety in operation of trains also have added greatly to the expense of the roads. Undoubtedly, there is no objection to making improvements of this kind, but, in fairness to the men who man the trains, credit should be given where due and it should be known that this condition has resulted in long hours of work and a greatly increased expenditure of vitality, energy and brains.

It should not be inferred from anything said so far in this article that men interested in railroads, or the well-wishers of railroads, object to government regulation, for probably no class of people are more thankful for the abolition of many of the practices into which they were forced than the managers themselves; but, as long as regulation has become an established theory of the government, let it be applied indiscriminately and without fear or favor to all interstate business. There is no more reason why the great problem of the high cost of living should not just as well be regulated by the government commission as are railroad rates. The fact that railroads are public service corporations does not modify the status of the question materially. It would be just as easy, and in fact, a great deal less complicated, for a commission to ascertain the expense in producing farm products, for instance, used by the whole populace and adding thereto the railroad rate from where those things are raised to where they are consumed, and a fair amount added for handling by the middleman—if middleman there must be—and then fixing the price which the consumer must pay. This would do away effectually with the present unfair practice of the producer getting barely enough out of his products to make him a living, and the railroads getting barely enough to pay for operating their trains, and the middleman getting 100 or 150 per cent. more than both of the other two from the consumer.

As a matter of fact, as long as the government has started in on a campaign of regulation, there is no logical reason on earth why regulation should not be applied to every business, or at least, every business dealing in interstate commerce. Or. if these laws of regulation are to be applied entirely to the railroads, then the logic of the whole thing undoubtedly would resolve itself into government ownership and control of these roads. In fact, the government controls them now in every way excepting the seemingly unimportant item of looking out for sufficient revenue to operate the properties successfully. It is not very difficult to imagine that the foremost thinkers among the managers of the roads at the present time are figuring on how the transition from private to government ownership is going to be accomplished. That it is going to be accomplished is a pretty well settled conviction. It has been suggested, and perhaps, with a good deal of logic, that taking into consideration the governmental function of eminent domain regarding public highways and other interests necessary for governmental operation, the government simply will take over and own the roadbeds and then charter operating companies to use these roadbeds, the government taking upon itself the responsibility of keeping them in good condition. The other thought about the matter is that if the government should take complete control of the roads and operate them, the owners will get a fair pay for the roads upon some basis of physical valuation. Indeed, this view of the matter seems to be suggested, if not borne out, by the fact that a bill is before Congress now providing for the physical valuation of all the roads in the United States. The thought back of all this is that if the government does acquire the roads and pays for them, at a valuation ascertained by experts, according to past experiences, it will not be very many years before that government operation will result in huge deficits which will so stagger the financial stability of the country, that the government will be glad enough to get rid of these roads and put them back into the hands of private owners, with guarantees of fair return for shrewd and economical management. If such a change or condition should be brought about, it is very easy to see where a vast sum of money might be made by a change from the present private ownership to government ownership, and from government ownership back again to private ownership. Moreover, regardless of all the evils possibly attendant upon any such purchase and sale as this, it is easy to see the great opportunity, or the great chance for many great and insidious evils to creep into the railroad problem.

Perhaps the one thing most detrimental to the

Digitized by Google

country at large would be the undoubted actual negation of all railroad enterprise. There would be no incentive for anybody to project new lines into territory where needed, nor would there be anybody really to put a veto on a projection of lines into some territory where perhaps the dominating reason for it would be that of the desire of some political boss. Also, to our mind, the contemplation of government ownership in connection with the employes of railroads is not a pleasant one. The legitimate operating managements of roads might be put into the hands of competent men and it might not be. The probability is that it would go by political preferment, and not by experience in line with economical management. No doubt at all but what the brothers, nephews, cousins and other relations of some big political boss would have to be taken care of, without any particular regard for the good of the service, and this, in turn, would have a very bad effect upon the rank and file of the men who actually do the work.

Without voicing any feeling one way or the other regarding labor unions of railroad employes, it is easy to be seen that whatever has been accomplished by the employes in the past in building up these organizations, the tendencies of which are toward sobriety and good service, and the further fact of large accumulation of funds for insurance purposes, under government management these really great and valuable accomplishments virtually would cease. Also, all the beneficial results of collective bargaining, personal contact and "talking it over," would come to an end, because, as is natural to suppose, then the railroads would be operated according to strict military discipline.

The railroads have a great problem to work out and the destiny of this country is inextricably bound up in that problem. The only way to settle it is in fairness, rectitude and righteousness. The people continually want better service, faster trains, more elegant accommodations, more safety—all of which are perfectly legitimate demands, but the carrying out of those demands costs money and the people ought to be willing to pay for them. Everything the railroads use, just like everything everyone else uses, costs more than it used to, and it costs the railroads more, just as it costs everybody else more.

It is to be hoped that these facts will speedily be recognized by the people and that in response to that recognition the government soon will consent to a raise in rates so that the necessary progress of the railroads will not be hampered.

Retrospect and Prospect

By LOGAN G. McPHERSON.

THE document which by common consent marked the beginning of this Nation was proclaimed in 1776. On another Fourth of July, little over half a century later, one of those who had signed the Declaration of Independence turned the handful of earth that marked the initial construction of the first railway projected in the United States. To Charles Carroll, of Carrollton, was given the privilege of participating in the formal declaration of the birth of a new nation and of making the formal pronouncement at the laying of the cornerstone of the Baltimore & Ohio Railroad, one of a series of closely sequent events that betokened the birth of a new industrial age.

Could the venerable gentleman have lived another half century he would have seen the beginning of a new railway era, with problems different from those which gave perplexity to himself and his colleagues.

Early Railway Development.

In his day the economic benefit to be derived from the railways outweighed every other consideration. Railways were needed. They were projected often without consideration of profit from their operation; built at any cost in the certainty that the outlay would be repaid many times through the public gain from their use. Cities wanted railways that they might distribute their wares in the interior, and the interior wanted railways that it might sell its products in the cities. In no case did the expectations of a widening commerce fail. Construction gradually departed from primitive types. There was development in track, in cars, in locomotives, and in business methods. Although states and municipalities contributed to the capital of many of the new enterprises the few experiments with state control and operation were failures. Railways were fostered, not antagonized by the people. The only widespread conflict in which they were engaged was that between the railways and the canals; and even this was not between all of the railways and all of the canals, but between railway and canal in immediate competition.

Effect of Civil War.

At about the time when it had clearly been demonstrated that the railways were more efficient and less expensive agencies of transportation than the canals came the Civil War. The need for an uninterrupted transportation of troops was a factor which led to the institution of through car service, a development that was accentuated by the demand for carriage of the mails without unnecessary transfer. Within a decade after the close of the war the main lines of the existing network had been laid or their course was clearly indicated. There were lines of rail between all of the principal industrial and commercial centres: from ocean to ocean, from the lakes to the gulf.

Thus closed the first half century of railway development in the United States. The railways had been encouraged on every hand. There were men still in the active life who had done business in the days when the mule with panniers, the wagon, the stagecoach, and the canal were the instrumentalities of transportation, and the traditions of these days were fresh in the popular mind. It was recognized on every hand that the building of the railways had made possible the extension of the population, political unification and the growth of industry and commerce. The men of rugged energy, foresight, patience and persistence who had built the railroads and organized railroad transportation towered high in popular esteem.

Digitized by Google

Broadening Railway Influence.

The first half century of the railway era began with the crude construction of short local lines designed to serve particular communities and particular regions. It closed with the extension, the connection, and frequently the corporate amalgamation of short local lines into through routes over which an increasing volume of traffic flowed to a wider population, rendering a broader economic service than to the residents of a particular city or to the producers of a restricted area.

It was no longer the main consideration that the railways carried passengers more expeditiously, freight more quickly, in larger quantity, and at less expense than did the stagecoaches, wagons and canals. It was no longer the point that a city could distribute its wares in a wider area and draw produce from a wider area than had been possible with these antiquated methods of transportation. It became the question whether the manufacturers and merchants of a city could distribute their wares in this area or that area in competition with the manufacturers and merchants of another city, whether the producers of a given area could send their products to this market or to that market in competition with the producers of another area. Variations in the rates of freight, so slight as to have no influence in determining prices paid by the ultimate consumer, became the dominant factor in limiting or extending the area in which a manufacturer or a wholesale merchant could dispose of his wares, or in determining over which route and in which market products of the field, the mines, and the forest should be sold.

Stock Watering versus Freight Rates.

This is the crux of the contest from which there is some evidence that we are emerging. At the beginning of this second half century, that is during the dozen years or so after the close of the Civil War, the manipulations of those who juggled with the finances of the railways became conspicuous, but these manipulations have had negligible effect upon the rates of the railways; the railways of the United States have always carried freight at rates that averaged on the whole far lower than those of any other country. Such juggling of railway finance as there has been has wrought injury to investors, but its effect upon the vast structure of economic benefit reared by the railways has been no more than flecks in the shifting shadow.

Yet it is the shippers that have raised the clamor, and to be sure not always without justification. There were rebates, the cutting of rates; stealthy devices of one kind and another were resorted to by both railways and shippers. Competition is warfare; business of that day was warfare. Rival railways were at war; rival shippers were at war; and railways and shippers were each trying to get the best of one another. All of this time business was being done, manufactures were diversifying; the output of mines, mills and factories was increasing; agriculture was extending. Yet in the denunciation of the railways it would almost seem that the underlying economic benefit which they yielded in greater and greater measure had been forgotten.

Economic Benefits of Unification.

The problems that arose in this period had barely been foreshadowed in the previous decades. Attempts at their solution by the railway companies themselves through pools, traffic agreements, partial coalition and complete amalgamation were set aside by public opinion in favor of governmental regulation, with the present status of which every one is familiar.

There is an old maxim that where combination is possible, competition is impossible. Instead of accepting this economic truth and facilitating and controling development along the lines indicated by it, the great body of the people of this country have set their teeth in its face. While federal regulation of the railways is tending more and more to regard them from the standpoint of their social service as a whole, the tendency of existing law is to prohibit such corporate unification as might tend to enlarge corporate administration in correspondence with an enlarged conception of social service.

The statement that the facilities of the railways as a whole should be so adjusted and utilized that they may render the best service to the Nation as a whole, will probably not be contested. The statement that the New York Central Railroad is a more serviceable agency than the separate, short railroads between New York and Albany of which it is constituted will probably not be contested. That the Chicago & Northwestern Railroad and the Chicago, Milwaukee & St. Paul Railway give better service to the regions traversed by them than could the score or more of smaller lines of which each is composed is likewise beyond contest. Yet public opinion now decrees that the same principle of combination, through which may be attained more efficient and economical administration and the better adjustment of facilities to service, shall not be carried the further step in application to the Great Northern and Northern Pacific Railways, to the New York, New Haven & Hartford and Boston & Maine Railroads, to the Union and Southern Pacific Systems.

Governmental Regulation.

If governmental regulation suffices to abolish the evils of underhand rate cutting, the giving of rebates and other unjust discriminations, will it not suffice to prevent or to abolish the evils to be feared from monopoly? The endeavor to obtain relief from the evils of unrestrained competition brought about governmental regulation. Why cannot governmental regulation be made effective as a restraint upon combination, promoting its beneficial, while prohibiting its injurious, effects?

Through the processes of an inevitable evolution the facilities of the railways, even under separate corporate ownership and administration, have tended more and more to become adjusted to the best service to the entire Nation. The formation of through routes brought about the standard gauge, which has enabled the freight cars of each railway to run over the lines of every other railway, and has led to the organization of the committee of the American Railway Association which compiles and disseminates information as to the surplusses and shortages of freight cars in each section of the country. There is a growing tendency to avoid wasteful and duplicate construction by the joint use by

Digitized by Google

different companies of the same tracks. The amalgamation of railways leads to the common use of switching tracks and other terminal facilities. To an extent it has led to a development that must become more pronounced as the traffic of this country increases, and this is the differentiation of the traffic channels. On the lines best adapted to the through movement of ore and coal should run solid trains of ore and coal; on the lines best adapted to the through movement of cotton should run solid trains of cotton, and so also with the other great staples of traffic. That competition which results in each railway endeavoring to obtain all of the traffic it can of every commodity, regardless of its adaptability for the most efficient transportation of that commodity, leads to economic waste just as did the oldtime practice of roundabout lines cutting rates to obtain traffic that were more efficiently moved by their shorter and more direct competitors.

The Problems of the Future.

As the problems of the second half century of our railway era were foreshadowed in the first, so also it may be that the problems of the third half century are foreshadowed in these later years of the second. It may not be impossible that in the next decade or so the problems that have arisen during the past generation will have been disposed of; that first and foremost, there will be brought about a radical diminution in the number of accidents; that contentions as to railway rates instigated by rival shippers and rival markets will have been brought into a certain equilibrium; that the wages of railway employes will be brought into equitable adjustment, and measures for the adequate training and discipline of railway employes made effective; that the right of the railways to a reasonable return for their service will be recognized and that the basis for that return will be established.

Interwoven with these problems is the great problem of adapting and maintaining the facilities of the railways to the best service of the whole people. As the combination of the short local routes into through routes and the extension of through routes over the entire country was the crown of the railway achievement of its first half century, may it be that the people will come to look upon the complete correlation and integration of the railway lines in each section of the country, to the end that they will best serve the needs of the traffic of that section and therefore of the whole country, as the crowning achievement of a later period?

If in each section of the country the securities of the railways were held in largest measure by the people of that section, if their chosen officials were men of proved integrity and ability, if the fullest knowledge were always available as to their affairs, if between the people and the railway managers there were mutual knowledge and frank discussion of the needs of the railways and the needs of traffic, and with a governmental body of the proper personnel to serve in the last resort as an arbiter of contentions, would not the railway problem in all of its phases be well on the way to solution? Is there any reason that this condition be not attained? Is there not evidence that we are advancing to that attainment and that the more serious consideration now being given on every hand to the various phases of the problem will lead to the broader popular understanding that will further that advance?

Immediate Requirements.

In the meantime the immediate and pressing needs of the railways must not be forgotten. While their performance becomes more and more intensive, ton-miles and passenger-miles increasing per locomotive, per train and per mile of line, their larger receipts are absorbed in increasing degree by expenses. While the crops of the country show little if any increase per acre, the prices of farm products have mounted fifty per cent., seventy-five per cent. and higher; and the net return of manufactures is over twice as great as that of the railways. It is, therefore, not great cause for wonder that from 1900 to 1910 the net capitalization of the railways increased but little more than half as rapidly as the capital value of agriculture or the capital value of manufacturing. This alone is sufficient to justify the apprehension of railway managers that they will not be enabled to develop the railway plant in pace with the development of traffic, an apprehension that even the extraordinary aggregate of the railway receipts of the immediate present does not allay.

Opinions on Anthracite Trust Decision.

Attorney-General Wickersham had this to say regarding the anthracite decision:

"The annulment of the 65 per cent contracts was a very important victory for the government. It opens the way for competition in the coal trade.

"It is also important because the court declares that although a contract may be innocent in itself, a bundle of them may constitute a violation of the law."

President George F. Baer says in reference to the anthracite decision:

"The decision as far as I am able to judge from the reports received sustains the company with the exception of the 65 35 per cent. contracts and the holding of the Temple Iron Co. stock. I have always been indifferent as to the 65 35 per cent. contracts. They were made with the operators to induce them to join in the settlement of the strike of 1902. They were never satisfactory to me because in times of dull trade we have had to take their coal and store it, and in times of active trade they have, as a rule, done just as they pleased as to delivering the coal to us under the contract.

"As to the Temple Iron Co. decision this is a matter of indifference. The Reading system never had any of the coal traffic from these mines. The property is a valuable one and we will sell our stock at a large profit to anybody who wants it."

J A. Monroe, vice-president of the Union Pacific, is quoted as stating that basic conditions throughout the West are extremely good and that a large business for the railroads in 1913 is anticipated. He asserts that the sections west of the Mississippi River have never been more prosperous than at present and that little attention has been given to the question of "Tariff Provision."

Biographic Sketches

SAMUEL REA,

WHO, ON JANARY 1, SUCCEEDED JAMES MCCREA AS PRESIDENT OF THE PENNSYLVANIA RAILROAD.

SAMUEL REA, who became President of the Pennsylvania Railroad on January first, succeeding James McCrea, retired, was born in Hollidaysburg, Pa., September 21, 1855. Mr. Rea's first connection with the Pennsylvania Railroad Company was in the Engineering Department in 1871 as a chainman and rodman. From 1873 to 1874 he was in the office of the Hollidaysburg Iron and Nail Company, but in 1875 reentered the service of the Pennsylvania, and during the next two years was Assistant Engineer in the construction of the chain suspension bridge over the Monongahela River at Pittsburgh, and upon its completion was appointed Assistant Engineer of the Pittsburgh and Lake Erie Railroad Company, then in the course of construction, with which he remained until the completion of that road. In 1879 he returned to the Pennsylvania Railroad System in the capacity of Assistant Engineer. From that year until 1883, Mr. Rea was the engineer in charge of surveys in Westmoreland county and of the rebuilding of the Western Pennsylvania Railroad to make it a low grade freight line. In 1883 he was transferred to Philadelphia as Assistant to Vice-President DuBarry with title of Principal Assistant Engineer, which he held until 1888, when he was made Assistant to the Second Vice-President. This office he resigned in 1889 to go to Baltimore as Vice-President of the Maryland Central Railroad Company and Chief Engineer of the Baltimore Belt Railroad Company. He again entered the services of the Pennsylvania Railroad in 1892 and was made Assistant to the President of that company.

On the day of his appointment he left for London, where, by direction of President Roberts of the Pennsylvania Railroad Company, he made an examination of the railways terminating in the English metropolis, and of the underground railways—then constructed and proposed, and subsequently, he had a special report thereon. The result of this experience was afterward put to good service on the Pennsylvania Railroad's New York Tunnel Extension.

After the death of Vice-President DuBarry in 1892, Mr. Rea was assigned to general construction work then in progress, the acquisition of right of way and real estate in that connection, the promotion of all new lines or branches, and the financial and corporate work incident thereto.

On February 10th, 1897, Mr. Rea was appointed First Assistant to the President of the Pennsylvania Railroad Company, and on June 14th, 1899, following the election of Mr. A. J. Cassatt as President to succeed Mr. Frank Thomson, Mr. Rea was elected Fourth Vice-President of the company. On October 10th, 1905, he was advanced to Third Vice-President, and on March 24th, 1909, to Second Vice-President. In addition to his former duties he was placed in charge of the engineering and accounting departments. On March 3d, 1911, Mr. Rea was elected First Vice-President.

On May 8th, 1912, when the practice of designating the vice-presidents numerically was discontinued, Mr. Rea was elected vice-president.

He is also Vice-President of the Northern Central Railway, Philadelphia, Baltimore and Washington Railroad, and West Jersey and Seashore Railroad companies, and a director of The Pennsylvania Railroad Company, and many other railroad and financial corporations.

Incident to supervising the corporate work of the subsidiary companies of The Pennsylvania Railroad Company East of Pittsburgh, and of the promotion and construction of new lines, Mr. Rea acts as president or vice-president of nearly all these companies.

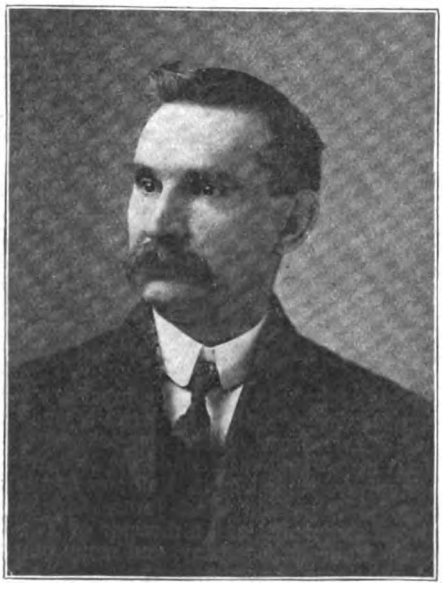
For many years he was interested in the project to bridge the Hudson River from Hoboken to New York City, and thus establish in the metropolis a terminus for the railroads using ferries from the Jersey side. He was one of the incorporators of the North River Bridge Company, chartered by an Act of Congress to build that bridge.

When other railroad companies failed to join The Pennsylvania Railroad Company in the project to bridge the Hudson, and after a very careful examination and report on the entire project

Digitized by Google

by engineering experts, The Pennsylvania Railroad Company determined to build its own tunnels under the Hudson and East Rivers, with a large station in the heart of New York City. After this plan had been fully approved by President Cassatt and the Board of Directors of The Pennsylvania Railroad Company, Mr. Rea was given direct charge of what is at present known as the most important piece of engineering work in this country and has carried it out to a successful conclusion. In recognition of the scope of this great work and of its public utility, the University of Pennsylvania, on February 22d, 1910, conferred on him the degree of Doctor of Science. As a part of this project may be considered the construction of the New York Connecting Railroad jointly by The Pennsylvania Railroad Company and the New York, New Haven and Hartford Railroad Company, which, with the tunnel extension of the Pennsylvania Railroad, will form a through route for railroad transportation between the Southern, Western and New England States.

Mr. Rea is a member of the American Society of Civil Engineers and of the Institution of Civil Engineers of London. He is the author of "The Railways Terminating in London," a comprehensive study based on laborious personal investigation of the physical and financial condition of the English Railway Systems.



JOHN F. AUCH,

RECENTLY ELECTED VICE-PRESIDENT OF THE PHILADELPHIA AND READING RAILWAY.

THE recent announcement of the election of Mr. John F. Auch as one of the vice-presidents of the Philadelphia and Reading Railway Company, a newly-created position, is a high tribute to his wide and practical knowledge of modern railroad and transportation problems, as well as a tangible recognition of the energy and ability which he has displayed throughout his active and successful career, and it certainly would have been a difficult matter to have made a stronger or more acceptable choice for the official position in question. It is likewise a deserved tribute to Mr. Auch's high personal character and enterprising trend of mind, and the announcement of his election has not caused any great surprise to his numerous friends and acquaintances, for those who are intimate with his innate ability and progressive personal qualities have always felt confident that he would win a high position in his chosen profession.

Mr. Auch's wide and varied training and experience, supplemented by the foundation traits of thrift, firmness and industry, eminently fit and qualify him for the important duties and responsibilities which will devolve upon him as vice-president. Mr. Auch will also continue in his present capacity as freight traffic manager, and the news of his election as vice-president has been favorably received and commented upon in business and railroad circles. On account of his long experience and eminent qualifications he will undoubtedly acquit himself of his new prescribed duties in an extremely satisfactory manner.

Mr. Auch is a member of the American Association of Freight Traffic Officers, which was organized in 1906. At the time of its organization he was made a member of the Executive Committee, and in 1907 was made its Secretary-Treasurer, which office he filled until elected President in November, 1910.

Mr. Auch entered the service of the Philadelphia and Reading Railroad in October, 1875, in the capacity of night operator at West Spring Mills. He alternated between night and day service in the same capacity at various points until the fall of 1879, when he was appointed station agent at Chalfont, Bucks County, Pa. He remained in this department of the service with two or three transfers until the summer of 1885, when he accepted the position of chief clerk in the office of the Division Freight Agent of the Philadelphia and Atlantic City Railroad, at Philadelphia, and being appointed Division Freight Agent to succeed Samuel Garwood in the fall of 1886.

In 1888, the separate office of Division Freight Agent for the Philadelphia and Atlantic City Railroad was abolished, and Mr. Auch was then appointed Traveling Freight Agent and assigned to duty in the Atlantic City Railroad and New York division territory. In 1889 he relinquished the title and duties of Traveling Freight Agent to accept the position of Chief Clerk to the General Freight Agent, which position he filled with marked ability until April, 1891, when he was appointed to the position of Division Freight Agent, with headquarters at Harrisburg, Pa. In the latter position he remained until April 16, 1894, when he was appointed Assistant General Freight Agent, doing service under this title fourteen years, or until May 1, 1908, when he was made General Freight Agent. On November 1, 1909, he was appointed Assistant Freight Traffic Manager, and December 27, 1909, Freight Traffic Manager, which position he has successfully filled until his election to the office of vice-president.

Ralph Budd has been appointed assistant to the president of the Great Northern, with offices in St. Paul.

Robert I. Farrington has tendered his resignation as vice-president of the Great Northern to take effect December 31st.

Alfred E. Rosevear has been appointed assistant to the vice-president of the Grand Trunk, with headquarters at Montreal, Que.

Financial

THE "MONEY TRUST" INVESTIGATION.

THE country has been startled by sensational testimony before the House Committee investigating the so-called "Money Trust." This investigation has been very carefully planned by Mr. Samuel Untermyer, the counsel for the committee, who has developed in an orderly way a large mass of testimony tending to show the centralization of financial control of many large corporations in the hands of a small group of New York financiers. Mr. Untermyer claims to have proven that eighteen banks and trust companies control, through interlocking directorates of 134 concerns, $25,325,000,000 of the capital of the country invested in industrial, transportation and general financial enterprises. These interlocking directorates consist of 180 men who hold in the aggregate 385 directorships in 41 banks and trust companies, having total resources of $3,832,000,000 and total deposits of $2,834,000,000; fifty directorships in eleven insurance companies having total assets of $2,646,000,000; 155 directorships in 31 railroad systems having total capitalization of $12,193,000,000 and a total mileage of 163,200; six directorships in two express companies and four directorships in one steamship company, with a combined capital of $245,000,000 and gross income of $97,000,000; 98 directorships in 28 producing and trading corporations having a total capitalization of $3,583,000,000 and total gross annual earnings in excess of $1,145,000,000, and forty-eight directorships in 19 public utility corporations having total capitalization of $2,826,000,000 and total gross annual earnings in excess of $428,000,000; in all, 746 directorships in 134 corporations.

The institutions which are alleged to control the Money Trust are J. P. Morgan and Company, First National Bank, National City Bank, Guaranty Trust Company, Bankers Trust Company, Kuhn, Loeb and Company, National Bank of Commerce, Hanover National Bank, Chase National Bank, Astor Trust Company, New York Trust Company, Blair and Company, Speyer and Company, all of New York; Continental and Commercial National Bank, First National Bank, and the Illinois Trust and Savings Bank, of Chicago; Kidder, Peabody and Company, and Lee Higginson and Company of Boston and New York. There is nothing new about these facts which have been repeatedly brought forward, notably by Senator LaFollette in 1908 in a speech in the United States Senate.

These conditions result from the natural concentration of loan funds in the large cities where, because of the superior inducements which can be offered, these funds naturally would flow into the larger institutions of those cities. The advantages of a large financial institution, especially when it is a question of making loans of large amounts, are so great that a number of consolidations of banks and trust companies have been formed in recent years. The growth of the Bankers Trust Company, the Guaranty Trust Company and the formation of the Continental and Commercial National Bank of Chicago being familiar illustrations of this consolidation movement. It is to New York, Chicago and Boston and Philadelphia, therefore, that corporations desiring new capital naturally go. The great bankers of these cities furnish the capital every year for a multitude of new undertakings or extension of existing enterprises. Being in a sense, responsible for the securities which they sell and seeking further advantageous connections they ask and obtain positions on the directorates of the companies which they finance. These connections being mutually profitable are continued and strengthened and the result is the centralization of control which exists from New York all over the country, and includes not only the large corporations which are enumerated in the report above referred to, but a great multitude of smaller institutions of every description affiliated with or dependent upon these large corporations. These facts are established and through them the counsel for the committee is seeking to draw the inference that the United States is held fast in the grip of a Money monopoly with J. P. Morgan at its head, a monopoly which is every year getting a firmer hold upon American industries and which if unchecked will in time become the absolute master of the American people.

These facts are indisputable but an entirely different inference can be drawn from them. The concentration of loan funds in the large cities, especially in New York, is clearly proven. Money comes to New York as wheat comes to Chicago, sugar to New Orleans, hogs to Omaha and Kansas City, turpentine to Savannah, wool to Boston, because New York is the best market for money just as these other cities are the best markets for the commodities which find there their principal market. It is in New York that money can be sold at the highest price. Only in New York can lenders always be certain of finding borrowers ready to take their money. The national banking law recognizes the desirability of the concentration of loanable capital by allowing banks outside of the reserve cities to deposit three-fifths of their lawful reserves or fifteen per cent of their deposits with a reserve agent, and further authorizes national banks in such cities as Philadelphia, Boston and Pittsburgh to deposit one-half of their lawful reserve with the reserve agents in New York, Chicago, and St. Louis. In the same way State banking laws quite generally allow State institutions to count as a part of their legal reserve deposits with other banks. The banking business of the country is built up on this foundation of centralized reserves which has concentrated the loanable capital of the country mainly in New York, and in New York has brought it under the control of the interests dominated by J. P. Morgan and Company. This situation has arisen because it has proven profitable to those who cooperate in its development. Because banks and corporations have found it advantageous to deal with New York institutions, to employ large private bankers to sell their securities, to admit these bankers to their directorates in order to be sure of effective co-operation when in need of capital, to carry their accounts with institutions large enough to lend $25,000,000 if need be to one borrower, and above all, to trust their interests to men in whose integrity they have absolute confidence. It is in its personal aspect that the money combination has the greatest interest. It is doubtful if this centralization of financial control could

Digitized by Google

have been accomplished under the leadership of any other man than Mr. Morgan. Mr. Rockefeller, measured by mere money, is a far stronger man personally than Mr. Morgan; his fortune is probably several times greater than that which Mr. Morgan has accumulated. Mr. Carnegie was at one time a much richer man than Mr. Morgan. Indeed, there are a number of men in the United States whose personal fortune is much greater than the wealth of the head of J. P. Morgan and Company. It is not money which gives Mr. Morgan his supreme power in American finance; it is the confidence which other men have in his integrity, in his ability to think for others, to subordinate his own personal interests to the interests of the group and in times of national peril to dominate by the force of his personality, backed by the implicit trust which men have in him, situations which are fraught with possibilities of national disaster. Such a man who has been in Wall Street for fifty years, who has seen several generations of would-be rivals rise and pass away, whose position to-day is stronger than ever before, and his associates, other men trust because by long experience they have found them worthy of trust. If when Mr. Morgan dies, and he is 76 years of age, a successor is found who can inspire equal confidence, who can hold together the group of immensely wealthy and powerful men who have gathered about Mr.Morgan, this so-called Money Trust will be continued. If such leadership is not available this huge combination of capital, bound together by nothing more tangible than mutual trust, will be dissolved. In other words, so long as the men who administer this enormous power recognize that they are public trustees, that they hold in their hands the welfare of the United States, just so long will they prove themselves worthy of confidence and control will come to them. If, however, upon Mr. Morgan's death, his vast power, if indeed it can be bequeathed, is passed on to others who will not administer it as trustees but for their own private advantage, then the Money Trust will immediately be broken into fragments.

THE STOCK MARKET.

THE stock market was weak throughout December, and on several occasions the severe pressure upon quotations resulted in serious declines. The extent of the decline in the active stocks may be seen from the following table which shows the high prices of four issues on November 29th, and on December 27th:

	Nov. 29th.	Dec. 27th.
Reading	171	167⅝
Union Pacific	173⅜	160½
Amalgamated Copper	85	76¾
United States Steel	75¼	68¼

Declines were general throughout the list and the market was very unsatisfactory. Serious trouble did not begin until the week ending December 14th. By this time the Supreme Court decision in the Union Pacific case had made itself felt. Apprehensions as to the consequences of this decision were mainly responsible for drastic liquidation which continued throughout the week, and which resulted in a decline of nearly 23 points in Union Pacific stock, and from 8 to 10 points in other issues. On Wednesday, December 11th, the total sales on the New York Stock Exchange reached 1,261,229 shares, the largest number since October, 1911. On this day the stock list showed an average decline of five points for the week. The last two weeks of the month have seen a considerable improvement in quotations and a large part of the losses have been regained. Prices are, however, generally lower than at the beginning.

THE FINANCIAL PROBLEM OF THE HARRIMAN LINES.

THE topic of principal immediate interest is the plan which can be adopted for the distribution of Union Pacific's holdings of Southern Pacific stock. The various considerations which must be kept in mind in formulating such a plan, are set forth in a brief filed on December 19th with the Supreme Court by the Union Pacific and the Oregon Short Line. The court is asked to sanction a plan for the sale of the Southern Pacific stock to the shareholders of the Union Pacific, substantially in proportion to their respective holdings, or by dividend to the stockholders, if such dividend be legally payable. The Southern Pacific shares which must be disposed of under the opinion of the court, amount to $126,650,000 par value. The capital stock of the Union Pacific is owned by over 22,000 shareholders, having an average holding of approximately 140 shares. The Union Pacific seriously objects to any plan for the public or general sale of its Southern Pacific stock. The brief points out that Southern Pacific stock, since the announcement of the recent decision, has ranged in price on the New York Stock Exchange from 111¼ to 105½ and that this stock has at all times, during the last four years, sold above par and at one time up to $139 a share. It would be impossible to sell this large amount of stock to the general investing public without a serious sacrifice of its value. The stockholders of the Union Pacific are the natural purchasers for the Southern Pacific stock. It is recognized that the proposition presented is different from that in the Northern Securities dissolution where a company was organized to hold certain stocks, and where a decision that such holding was illegal practically worked a dissolution of the company and a distribution of its assets to its stockholders. In the present case the Union Pacific incurred obligations to purchase this Southern Pacific stock and the distribution of this stock to its shareholders would represent a large special dividend.

The Attorney General takes exception to the plan offered on behalf of the Union Pacific and suggests that the requirements of the Supreme Court's decree can best be carried out by offering the stock to the shareholders of both the Southern Pacific and the Union Pacific. The shareholders of the Union Pacific, he points out, can fully protect themselves as to the price at which the stock is to be offered, but if the offer is exclusively made to the Union Pacific stockholders and if the offer is accepted, it will result in retaining control of the Southern Pacific in the hands of a comparatively small number of Union Pacific stockholders who now own a majority of Union Pacific stock. The Government admits that a public sale of such a large amount of stock is impracticable. The Attorney General has apparently departed widely from the opinion which he held at the time the plan of dissolution of the American Tobacco Company was attacked by certain independent tobacco manufacturers and growers. That plan, it will be remembered, provided for a pro rata distribution of securities among the

Digitized by Google

stockholders of the American Tobacco Company. It was objected that this plan left the control of the various companies into which the trust was separated in the hands of the same group which previously dominated the large corporation. The Attorney General defended the plan on the ground that the individual defendants who, it was conceded would own a controlling interest, in the common stock of the new American Tobacco Company, and such proportion of the securities of the subsidiary companies as their common stock holdings gave them, would obey the mandate of the court forbidding them to conspire or combine to continue the unlawful conspiracy in which they had been engaged, and in fact, events have proven that the Attorney General was right.

In commenting upon the plan of a pro rata distribution of Southern Pacific stock to Union Pacific stockholders, however, the Attorney General makes the following comment: "An adjudication that where stock of one or more corporations is acquired and held by another, under such circumstances as to constitute an unlawful combination in violation of the Sherman law, and it is so decreed, that the stockholders of the holding company have a vested right to a pro rata distribution of the stock so unlawfully held, would go far to emasculate the Sherman law, and it is submitted no such proposition can be sustained either on principle or authority."

Of secondary interest to the disposition of Southern Pacific stock, is the future of the two properties under independent management. Before the Union Pacific acquired control of the Southern in 1901, the Southern did compete actively for transcontinental business. During the last few years, however, the Southern Pacific's traffic of this kind has seriously declined. The opening of the Tehuantepec route with its forty-cent rate as compared with the two-dollar-rate on freight shipped over the Southern Pacific via New Orleans, has injured the Southern, and with the opening of the Panama Canal the Southern Pacific's share in transcontinental business will be still further reduced. Little effect is, therefore, likely to be produced upon the earnings of the two companies from transcontinental traffic by their separation.

A more important consideration is the future relations between the Central Pacific and the Union Pacific. The Court's decree stated expressly that an arrangement whereby the Union Pacific should retain control of the Central Pacific would not be repugnant to the law. It is not considered likely, however, that the Southern Pacific would dispose of such a valuable part of its system. Three alternatives are therefore open to the Union Pacific to secure a Western outlet. The first is a traffic agreement with the Central Pacific; the second, a traffic agreement with the Western Pacific, and third, the construction of a Union Pacific line to the coast. Of these the first is most likely. The Union Pacific does not depend upon the Central Pacific for an outlet to San Francisco any more than the Central Pacific depends upon the Union Pacific for an outlet for its own eastbound traffic to the Pacific Coast. The two roads have been operated together since the beginning and it is unlikely that their directors will fail to work out a plan whereby these profitable relations may be continued. Certainly in such a bargain the advantage lies largely with the Union Pacific since the Central Pacific, without its eastbound connections, is little more than an inland spur ending in Utah.

To add to the difficulties confronting the Union Pacific, the publication of the pamphlet report of the company for the year ending June 30, 1912, shows that net earnings were reduced by $4,491,713, or 12½ per cent. A number of causes contributed to this decline. There was a decrease in revenue from a shortage of crops, with the resultant shrinkage in general traffic, and there were reductions in rates made by commissions, both state and interstate; there was an increase of 1.17 per cent in operating expenses, a very large increase in taxes—26.11 per cent, and an increase in interest charges resulting from the payment of a full year's interest and rentals on newly built lines taken over last year, but on which the earnings have not as yet been fully developed. In five years payments for taxes have more than doubled, rising from $2,069,734 in 1907, to $4,368,788 in 1912. The total surplus of the company over fixed and other charges was $34,039,993, and after the payment of the regular 10 per cent dividend, a balance remained for surplus of $8,393,510.

THE BOND MARKET.

THE bond market during December continued the downward drift which has been a characteristic of the entire year. Beginning with February, when bond prices were at the year's highest level, the movement has been with few interruptions, steadily downward. The average list of bonds on the New York Stock Exchange list is down more than two points from the high level of the year, and between two and three-quarters and three points from the highest figures of 1911. The extreme declines have of course, been in the more speculative issues, such as Rock Island collateral fours and St. Louis and San Francisco refunding 4's, which have fallen 9⅛ and 7 points respectively. Erie general 4's have fallen 5¼, and Colorado and Southern general 4's 4⅜. The very best bonds in the list, however, have participated in the decline. Reading general 4's, for example, have declined 2¾, and Atchison general 4's 3¾. The investor can to-day buy the highest grade bonds to yield over 4.25 per cent, bonds which eight years ago could not be bought on better than a 3½ per cent basis. The indications are that the very best class of corporation borrowers will have to concede higher rates of interest to market their securities. Over $250,000,000 of short term notes will mature during 1913 and these notes, for the most part, bear high rates of interest. So far as they must be refunded into long term bonds an approximation must be made to the rates of interest which they now pay.

THE OUTLOOK.

THE indications are that the railroads must turn from financing with bonds to a larger use of stock to obtain funds for the necessary expansion of their facilities. The opportunity of issuing first mortgage bonds is practically gone, the amounts of these bonds authorized by leading railroads has been about exhausted. What remains is the class of refunding bond and the convertible debentures. A debenture bond by itself is not popular with the investor. Its marketability arises out of the speculative possibilities of converting it into stock of the issuing company. It is well recognized that the sale of convertible bonds is a deferred sale of stock at the conversion price. It would seem to be preferable to the use

Digitized by Google

of this indirect method to appeal directly to the stockholders to furnish the capital for extensions. With companies whose stock sells at a high premium no difficulty is experienced in raising large amounts of capital from the stockholders. The method is to sell the stock at par, giving the holders the privilege, measured by the difference between the par and the market value. The Great Northern and the Lackawanna have, within the last fortnight, announced subscriptions of this character. With companies whose stock sells below par, however, it is difficult and indeed practically impossible without special legislative action, to dispose of new shares. The outlook for the financing of this class of companies is not promising.

Although the outlook for the railroads in 1913 is not all that could be desired in view of difficulties with operating expenses, financing and rates, current developments are by no means discouraging. The most recent information from a number of leading companies affords a basis for a more optimistic feeling. The Milwaukee and St. Paul, for example, which had such an unfortunate year in 1911, made a substantial improvement during the present year. For October the gross earnings of the St. Paul and Puget Sound combined, were $1,685,862 better than last year, and the increase in the net earnings of the two roads aggregated $1,209,787.

The Missouri Pacific, which had a most unfortunate year ending June 30, 1912, in the four months of the current fiscal year to October 31st, shows an increase in surplus over fixed charges of $2,094,000 over the results of the corresponding period of 1911. The company is, moreover, saving about 70 per cent of the increase in gross earnings for the stock.

The Wabash is making rapid improvement. Officials of the company predict a total of $32,000,000 in gross earnings for the current fiscal year, or $1,500,000 in excess of any previous twelve months. The company, during the remainder of the year, will receive the benefit from a large amount of new equipment and from the second track and other improvement work now in progress. Without the benefit of these expenditures in the three months to September 30 the company earned $183,000 over all fixed charges.

Another Gould property, the Wheeling and Lake Erie, is making a favorable showing. In November the company's gross revenues increased 12.2 per cent, as compared with the same month in 1911, and 22.3 per cent, as compared with 1910. For the year ending June 30th, 1912, the total fixed charges and taxes aggregated only $1,499,274, and in five months net earnings have been $1,421,029. In other words, the company has already earned its full interest requirements.

These figures of railway earnings are especially significant because they are reported by companies whose finances were generally admitted to be seriously depressed during 1911. The fact that they have been able to make such a remarkable recovery shows that from the standpoint of earnings, the railway situation of the country is thoroughly sound. This conclusion is enforced by the figures for 100 roads for October reported to the *Wall Street Journal*. The operated mileage covered by these roads equalled 196,816 miles, as compared with 193,440 miles for October, 1911. The gross earnings of the 100 roads showed an increase of $31,796,552 and an increase in net earnings of $12,931,002.

As Mr. Hill pointed out, if only the necessary facilities can be provided to take care of the enormous increase in traffic, which the existing agencies for the production of traffic are now ready to furnish, the railroads of the United States will enter upon the most prosperous period in their history.

President Underwood's Solution of the High Cost of Living.

F. D. Underwood, president of the Erie Railroad, who is recognized as possessing free trade tendencies of a decided character, offers as a solution of the high cost of living, the advisability of placing export tariffs on all products produced in this country and taking the import tariff off all products of foreign countries that are necessary to feed, clothe and add to the comfort, but not luxury, of our citizens. In a recent press interview he says:

"Every time we ship a million bushels of wheat abroad the American people have to pay a higher price for the balance retained for their own consumption. The same is true of meats, wool, coal and every commodity. Why should we permit coal to be shipped out of the country and deprive unborn generations of their supply unless foreigners are willing to pay the Government a handsome duty for the privilege of securing it? Why steel, meats, grain and other things we produce? Why increase the cost to ourselves in order to help other nations out? Also, why should an import duty be imposed on foreign commodities actually needed by the American public?

"They say it is to protect the American workingman. That is a fallacy. The American working man is well able to take care of himself as witness the rates of pay of $5 per day for engineers, $4 for conductors, and so on down the scale. Also $7 to $4 per day for nearly all other classes of good labor, and the regularity with which they get more whenever they think they need it. The only working man whom the tariff protects is the foreign element. The others need no help in looking after their own interests. Look at the common laborers on the railroads and in the steel mills. They are all foreigners who exploit America, receive high wages, live on 30 cents a day and when they have made enough money go back to the old country to live in luxury, or at least comfort.

Effect of State Regulation.

President Sproul, of the Southern Pacific, in a recent address at a banquet of the San Francisco Chamber of Commerce, stated that the Southern Pacific pays 25 per cent. of the direct taxes paid by the State of California and that 76 per cent. out of every dollar of its earnings inside the State is given directly to the people through the payment of wages and the purchase of local supplies.

In the course of his address he stated that the reduction of $2,000,000 said to have been made in railway earnings during the year by State regulation really meant that $40,000,000 of improvements and betterments in the service were lacking as a result of this reduction in rates.

Operation

THE INTERSTATE COMMERCE COMMISSION ON RAILWAY ACCIDENTS.

IT did not require the annual report of the Interstate Commerce Commission—which is chiefly notable because of the fact that the greatest emphasis is placed upon this subject—to make it apparent that the most serious problem in the field of operation concerns the prevention of accidents. From every side evidence forces itself upon the observer that the movement for the conservation of human life and of the property of the shipper and of the railroads has become a popular issue. The activity of the various state commissions and of the Interstate Commerce Commission in investigating the accidents which have occurred from time to time is matched in kind by the serious attention and energetic efforts of the railroads themselves to find a solution for this most serious question.

The Interstate Commerce Commission's study of the accident problem, according to its annual report, "has proceeded far enough to indicate the need of more effective measures than thus far have been taken to secure safety of railroad travel." The Commission's figures show that of the total of 8,215 derailments during the year, 1,877 were caused by defects of roadway, and 3,847 were due to defective equipment. These figures indicate an increase over the previous year of 652 derailments due to bad roadway, and 1,023 due to defective equipment. Of the 31 derailments investigated, which it should be parenthetically noted were the most serious, involving in each case passenger trains, 14 were either directly or indirectly caused by bad track. According to the Commission, 5 out of these 14 derailments would probably have been avoided had existing speed restrictions been observed; but in the remaining cases no adequate speed restrictions were in force. In three of the cases the track conditions were so obviously unsafe that derailments were likely to occur even when trains were running at low speed. In one serious derailment an examination of the track in the vicinity of the accident disclosed 906 rotten ties within a distance of 147 rail lengths.

Notable Effect of Steel Car.

The rapid introduction of steel cars, which the Commission states is progressing "as rapidly as conditions will permit" is bringing about a situation in which "the danger from the use of unsound cars is gradually disappearing." Summarized briefly the findings of fact of the Commission as to the cause of accidents can be grouped under three heads:

(1) Accidents caused by the dereliction of duty by the employes involved.

(2) Accidents due to excessive speed and endeavors to make schedule time.

(3) Derailments due to defective roadway and the use of unsound rails.

The Commission rightly says that "the most disquieting and perplexing feature in the problem of accident prevention is the large proportion of train accidents caused by dereliction of duty by the employes involved." The Commission believes that "as a rule there are no men that have a keener appreciation of their responsibility than railroad trainmen and enginemen," and yet it is pointed out that "sixty-three per cent of the whole number of accidents investigated were caused by the mistakes of employes." "There is a disposition in some quarters," continues the report, "to charge these lamentable errors to failure of discipline and to hold employes wholly responsible for such failure. This is a superficial view which contains no promise of effective remedy. A remarkable increase in the weight of trains within recent years and crowding of tracks and terminals caused by the movement of an enormously enlarged volume of traffic have greatly increased the duties and responsibilities of train service employes and multiplied the chances of error on their part. Notwithstanding these added duties and responsibilities which the conditions of modern railroading have imposed upon employes, the methods of discipline and regulations calculated to insure safety in train operation have remained practically unchanged."

The Commission further points out that excessive speed has been an important factor in many train accidents and "that conditions of safe operation are often ignored in an effort to bring fast trains in on time. This is a bad practice for which the traveling public is largely responsible, and it should be discontinued. Adequate measures should be taken to compel low speed wherever conditions require it whether schedules are maintained or not."

The Human Problem.

"To prevent collisions adequate measures must be taken, first, to reduce the chances of human error to a minimum, and, second, to neutralize the effect of such error when it occurs. The recommendations previously made for legislation requiring the standardization of operating rules and the use of the block system were designed to reduce probability of mistakes by employes, and those recommendations are once more presented for consideration of the Congress. Uniformity and consistency in operating rules are necessary to secure safety, and it is not probable that a satisfactory code which will meet the demands of modern operating conditions can be secured without appropriate action by the Federal Government."

"Safety first," is the paramount rule of train operation suggested. "Rules which a few years ago were perhaps reasonable and proper remain in force, although it is well known that they are no longer consistent with the demands of traffic, and it too often happens that these solescent rules which place entire responsibility for safety upon employes who are already overburdened are the only measures relied upon to avert possible disaster."

Commission Has No New Remedies.

At first glance, and as construed by a large proportion of the daily press, the conclusions of the Commission upon the accident problem constitutes an indictment of the railroads. A careful analysis of the report will convince any one, however, that aside from pointing out facts already well known concerning the cause of accidents and

Digitized by Google

repeating its recommendations concerning block signals and standardization of operating rules, the Commission offers nothing important or practicable by way of solution. It either is baffled by the problem which is presented or it feels that the question is one which cannot be worked out in any manner except by the railways themselves.

Commissioner McChord's Views.

A comparison of the language of the accident portion of the report of the Commission with the paper read a few weeks ago by Commissioner McChord at the First Co-operative Safety Congress held under the auspices of Iron and Steel Electrical Engineers shows that the greater proportion of the report is taken bodily from this address. While it is not safe to assume that the Commission has adopted Mr. McChord's views in their entirety, yet it seems likely that his analysis of the problem will, speaking generally, coincide with that of his associates. As Commissioner McChord remarks an analysis of the accident bulletins shows unmistakably "that by far the greater number of these harrowing train accidents are due to human error," nor are these errors confined entirely to those lines operating under the train order system for a considerable proportion of them occur upon lines in which the block system has been installed. "Some of the worst collisions noted in the accident bulletins have occurred on block signal roads. Obviously the block system can only afford protection when its danger warnings are observed and obeyed. The intensity of attention and quickness of perception required of enginemen on our modern, high speed trains lead to the results that they sometimes fail to observe or obey signal indications, and when this happens disastrous consequences are almost sure to follow. In the operation of the manual block system also, block operators sometimes make mistakes which lead to fatal results."

Necessity for Investigation.

Continuing, the Commissioner declares that "the investigations have not yet proceeded far enough to indicate the need of any specific legislation other than that which has already been proposed, but that they have confirmed the need of a law for the compulsory use of the block system, and for the use of automatic stops in certain situations, as also for a uniform code of signals and rules, a bill providing for which has already been introduced in Congress." He also believes that "failure of railway officials to determine with scientific accuracy the limits of safety, especially with respect to speed on curves, no doubt has led to many derailments There are no accurate engineering data showing the actual stresses which are set up in railway track structures by locomotives and cars of different weights and moving at different rates of speed. . . . . There is urgent need of accurate information on this point." He is further of the opinion that the drop test as provided in current specifications for the manufacture of rails "does not reveal the presence of interior defects of a serious character. There is urgent need of reform in the requirements of specifications as well as in the methods of inspection at the mills, so as to insure that structurally sound rails will be obtained."

Commissioner McChord very properly concludes that "no specific cure for these disasters can be offered, for none is at hand," and "that in the working out of this problem of greater safety on railroads we shall get no aid from the study of railroads of other countries. Our problem is essentially peculiar to this country and must be solved in the light of conditions existing here. The most difficult and perplexing factor in this problem is the personal equation. The failure of the man at the critical moment is the thing to be guarded against and this involves generally a reformation in the method of discipline and rules of operation."

The Real Solution.

Particular emphasis ought to be laid upon the closing paragraph of the Commissioner's address, in which he declares that great possibilities in the solution of the problem lie in the organization of so-called "safety committees." "These are new features in the administration of many prominent roads and the slogan 'safety first' has become a watchword in the details of their operation. In making safety the dominant idea in the minds of employes, by continually talking about it and pointing out methods for its attainment, an important step in the right direction is taken It is necessary for the employe to think right before he can act right. These safety committees are also bound to be an important factor in reawakening in employes that old time feeling of personal interest and pride in the record of 'our road,' that has been so largely dissipated by modern railroad development. In short, co-operation for definite results along the line is bound to result from the well directed efforts of these committees."

SUCCESS OF LEHIGH VALLEY'S SAFETY PLAN.

IN striking confirmation of Commissoner McChord's view concerning the safety committee is the experience of the Lehigh Valley Railroad with this plan. This company has organized a general safety committee composed of the general manager, superintendent of motive power, maintenance of way engineer and whatever other officers or employes the general manager may appoint. In addition to this general committee there has been organized a divisional safety committee for each division. On these divisional committees there is an engineer, a fireman, a conductor, a trainman, a switchman, an agent, and a foreman—in other words, a representative from every branch of the service. The division committee has a regular meeting twice a month. The members not only report upon their own observations, but transmit suggestions from employes. In addition, many valuable suggesions come through the mail. These communications are always acknowledged, and the matters referred to are always investigated. An employe who makes a suggestion receives a report from the committee as to just what has been done with it, and if it is not adopted he is told the reasons why. The man on each division who makes the best suggestion towards increased safety of operation is rewarded by one month's vacation with pay in addition to an "honor button." Annual passes are granted to employes with clear records for an entire year.

Each member of the divisional committee is charged with the duty of keeping a sharp watch for imperfections in either physical property or operation, as he goes about his regular duty. Noth-

Digitized by Google

ing is to be too small for him to take account of, and he is to be especially watchful to detect carelessness and to use his influence upon his fellow employes to prevent the recurrence of such practices. He is to discourage taking chances, pointing out to the men the extent of suffering inflicted upon wives and children every year as the result of such accidents. Statistics are compiled from the reports of the Interstate Commerce Commission for the use of the divisional safety committees in this work.

While it is yet too early for the company to be able to form any definite conclusions as to the tangible results of this work, yet sufficient time has elapsed to show that this supplementary work in accident prevention has been particularly effective in reducing the number of so-called "little" accidents. These accidents, although they do not attract great attention when they occur, are responsible for the larger proportion of the total loss of life and property in each year.

RAILWAY COMMISSIONERS ON RAIL BREAKAGE.

THE "Committee on Rails and Equipment" of the National Association of Railway Commissioners has presented an interesting report on the causes of rail breakage and the means by which the quality of rails may be improved. This committee was composed of one member each from the Up-State Commission in New York and from the Indiana and Minnesota commissions. The committee, which was appointed several months ago, was requested by the President of the Association to determine "whether the question of government inspection may not be desirable both in the matter of manufacturing rails and the construction of equipment, and perhaps legislation enacted requiring a rigid inspection and more uniformity in the specifications used by different factories. . It may be profitable to inquire whether a different character of rail may not be needed in those sections of the country where the climate is subjected to extreme changes of heat and cold than in the more temperate climates."

Causes of Rail Failures.

It is the finding of the committee that rail failures do not differ essentially from those experienced in the past. "The problems of rail failures and rail wear are continuous ones and have always been serious, and will probably always remain so." The committee points out that on many of the smaller roads and branch lines there are practically no rail failures. "The problem appears to be principally confined to railroads which handle a large tonnage of heavy and fast traffic." The matter of rail breakage is due, in the opinion of the committee, to the increasingly heavy traffic, high speeds and increasing wheel weights. The committee reports that the statistics of accidents resulting from rail failures are incomplete and unsatisfactory, and that there is a wide difference in opinion among railway men as to the causes. Moreover, the committee is of the opinion that the danger from broken rails is not so great as is generally supposed. "The statistics for a ten-year period indicate very small percentage of casualties from broken rails, compared with the total accidents to passengers and employes Broken rail accidents are much less serious, as measured by casualties and destruction of property, than collisions."

The Importance of Cold Weather.

Commissioner Sague, of the committee, in his remarks to the Convention, stated that "the principal reason for winter breakage, as compared with summer breakage, is what we may call the anvil effect. The roadbed is frozen, the elasticity of summer ceases, and the hard, unyielding roadbed produces the effect which we find with excessive road breakage in the winter." The facts brought out by the committee show that there is a larger number of rail failures in the roads of the far north and northwest than on those farther south, and that in the State of New York there are from 364 to 895 failures per month in January, February and March, and about 200 per month for the other nine months of the year. The committee quotes with approval from the report prepared by Mr. P. H. Dudley for the American Railway Engineering Association, in which he asserts that "in many localities the greatest breakage of rails on descending gradients is where the speed of the present trains approximates 80 to 90 miles per hour. Rails of the same make on the opposite track in ascending gradients, where the same equipment runs over them at the slower speeds, have not broken during the late extreme weather."

High speed schedules in winter, in connection with defective track and equipment, is found to be the cause of much rail breakage. Train delays are more frequent in winter, with the result that there is greater pressure to make up time wherever possible. The Federal Government, the committee says, is responsible for high speeds to the extent that it has encouraged speed competition in fast mail service, which has sometimes led to reckless running. "There has also been some tendency by State Commissions to order additional stops without due consideration of the increase in speed which such stops demand. . . . . We think the railroads will receive public support in adopting schedules and practices which will keep trains moving more uniformly on time, as we believe that more criticism is caused by the sidetracking of local trains to permit delayed through trains to pass, than is ever compensated for by public approval of fast service." The action of the Pennsylvania and New York Central Railroads in lengthening the schedule of their New York to Chicago specials from 18 to 20 hours, is given unqualified approval. The committee also believes that the demand for all-steel trains, bringing about an increase in wheel weights, is largely responsible for the increased rail breakage. The committee says that "the facilities for maintaining the heavier rolling stock, especially locomotives, have not kept pace with the increased weight and size."

Summary of Conclusions.

Summing up its conclusions, the committee finds that the principal causes for the increased frequency of rail breakage as compared with the past are, (1) the increase of over 60 per cent in proportion of phosphorus in the finished rail,—that is, from 0.06 to 0.10 per cent—owing to the gradual exhaustion of pure ore suitable for the Bessemer process of manufacture; (2) the rapid increase of wheel weights and speed brought about by traffic requirements, "which has resulted in more severe conditions of service than have ever before been experienced in railroad history."

Digitized by Google

Remedies Suggested.

It is the belief of the committee that the following methods will be found most effective in reducing rail breakage:

(a) Improved maintenance of equipment, especially of wheels, and reduction of the number of worn and flat wheels; the improved balancing of locomotives, improved track design and maintenance, including more effective drainage.

(b) The substitution of open-hearth for Bessemer steel, with consequent reduction of phosphorous.

(c) Improved methods of manufacture, especially directed to secure sound ingots, sufficient discard to remove the segregated and defective metal at the top of the ingot.

(d) Heavier rails and improved sections, and especially sections with heavier bases.

(e) Rigid specifications and careful inspection of all details of manufacture.

Disapproval of Government Inspection.

The final conclusions of the committee briefly summarized are as follows:

(a) "That present conditions do not require the inspection by the Government of rails and equipment, or legislation concerning specifications or inspection.

(b) "The most effective governmental method of securing continued improvement in the rail situation is the careful and thorough investigation of all important accidents which may be caused by rail breakage. In this connection, it is desirable that each States commission should keep informed as thoroughly as may be practicable regarding the rail failures upon the lines under its supervision.

(c) "The Government tests of rails and ingots, which were begun a few years ago, should be continued, and special study should be given to rail steel made by the basic open-hearth process"

The entire report is well worth reading by railroad officials. It will be printed in full in the proceedings of the Convention and copies can be secured from William H. Connolly, Secretary of the Association and Chief Clerk of the Interstate Commerce Commission.

SUCCESS OF NORTH-WESTERN SAFETY WORK.

THE Chicago and North-Western Railway is credited with being the pioneer in the promotion of safety campaign. Since the organization of its work, twenty months ago, 145,000 out of a total of some 240,000 miles of railroad have taken up the campaign. The North-Western's results thus far show that there has been a reduction of 29.9 per cent in the number of employes killed, 31.4 per cent in the number of employes injured, 36.3 per cent in the number of passengers killed, and 16 per cent in the number of passengers injured.

It is the opinion of the "Railway World" that in campaigns of this character by railways among their employes must lie, to a large degree, the solution of the accident problem. A certain proportion of accidents cannot be prevented, for among the thousands of cars and locomotives, the millions of tons of rails, and the labyrinth of switches, cross overs, and other special work, it is inconceivable that mechanical imperfections and defects shall not arise. The most perfect block system which has ever been devised is not mechanically error proof. When to all of these physical and inerradicable causes of accidents must be added the element of human frailty, the fatal moment of indecision or forgetfulness and the unconscious or deliberate disobedience of orders, one is forced to the conclusion that a distressingly large number of accidents is an inevitable feature of railway operation. But the truth is, as universally contended, that there are entirely too many such accidents and that railways, after having expended untold millions of dollars in better equipment, tracks and signal systems, are apparently no nearer a solution of the problem than at the beginning. The difficulty is that the sense of individual responsibility of the employe has been dulled. He has ceased being careful himself and has relied upon others to watch out for him. Until a spirit of individual responsibility and continual watchfulness are recreated the annual slaughter will continue.

RESULTS OF OFFICIAL INVESTIGATIONS OF RECENT WRECKS.

IT is interesting and instructive to run over the reports of the experts of some of the State commissions and of the Interstate Commerce Commission containing the results of their investigations of some of the most serious wrecks that have occurred.

Findings in New Haven Wrecks.

Commissioner McChord, of the Interstate Commerce Commission, in reporting upon the wreck at West Port, Connecticut, on October 2, finds that this accident was a duplicate of that to the Federal Express at Bridgeport, Connecticut, in July last. The West Port wreck was due, in the opinion of the Commissioner, to excessive speed of the train in passing a cross-over from one track to another. "The Commission is satisfied that the neglect to comply with the recommendations in its report on the Bridgeport wreck was largely a contributing cause of the Westport accident and its accompanying loss of life. The recommendations of this Commission are not mandatory. If, however, they are ignored and neglected and large loss of life results therefrom, there can be little doubt of our duty plainly to report it. If railroad directors and managing officials remain passive and give to such occurrences no such serious consideration as the situation demands, then it becomes the duty of public officials bluntly and plainly to point out to them their duties as trustees of the safety of the traveling public. The appalling railroad catastrophes of the last few years call upon all connected with railroad management for more strenuous efforts to secure safety for those who travel."

The Commissioner recommends that automatic train control be installed to insure safety in running trains at high speed. In the absence of such automatic control, the Commissioner suggested, switches should not be set to divert a high-speed train from one track to another at a cross-over which is not safe for high speed, until the train has been stopped; also that on interlocking plants where trains are operated over facing switches, approach locking should be provided to prevent switches being changed.

Mr. Ellwell, the Chief Engineer of the Public Utilities Commission of Connecticut, in his report concerning the wreck of the Merchants' Limited Express on the New Haven at Green's Farms, on November 15th, completely exonerated

Digitized by Google

the company from any responsibility therefor. In his judgment, the wreck was caused by a broken equalizer bar on a dining car. This bar dropped on the roadbed, making a plainly discernible track for a considerable distance before coming to the switch where the derailment occurred It is Mr. Ellwell's belief that the bar, dragging through the switch disarranged the points and derailed the cars following. He finds that the rails, ties and switch-fastenings at the point of wreck were in good condition. He says that at a joint hearing with the Interstate Commerce Commission, it was conclusively shown that the defect in the equalizer bar could not have been seen at any car inspection. He recommends that railroad companies make frequent special examination of equipment for the purpose of locating defects in metal parts therein. The New Haven issued a public statement seting forth the findings of fact in connection with the Green's Farm wreck, in which it is stated that "The company feels that it should make clear to the public that the standard of track construction and maintenance on this line is of the highest character, frequent and regular inspection being made by adequate maintenance forces."

The Pennsylvania Wreck at Glenlock.

One of the most interesting wrecks, from a scientific standpoint, occurring during the past month—if any wreck can be interesting—is that which occurred upon the Main Line of the Pennsylvania Railroad at Glenlock, a few miles west of Philadelphia, on November 27th. There is a slight curve at the point where the wreck occurred, but no cross-overs or special work of any kind. The train in question was a double-header, fast through train with twelve steel coaches and Pullmans. It was six minutes late at the point where the accident occurred and was traveling at the rate of 48 miles per hour. The wreck was immediately investigated by the Marshal of the Pennsylvania State Railroad Commission, by a committee of railroad officials and mechanics appointed by the Pennsylvania Railroad Company and by the experts of the Interstate Commerce Commission. The first two investigators have made their reports, while the Interstate Commerce Commission has not yet published its conclusions. Both of the published reports agree that the wreck was in some measure affected by the rupture of a cover plate on the bridge over the Trenton cut-off, while crossing which the train left the track. The rupture of this plate permitted the superimposed box girder located in the center of the bridge and carrying the span at that point, to drop down 18 inches.

The Marshal of the State Railroad Commission finds that six minutes before the derailment a train of seventy-five empty coal cars had passed over the bridge; that physical and chemical tests show that the plate had been fractured before the weight of the ill-fated passenger train brought about its final rupture. The break in the plate was practically hidden by the girders and angle bars, and it would have required an inspection of a very searching character to have discovered the fracture. The special committee appointed by the General Manager of the Pennsylvania Railroad expresses the belief that the primary cause of the wreck was an obstruction of an unknown nature on the tracks east of the bridge. It is the theory of the committee that the striking of the obstruction resulted in a shock and jar sufficient to cause a rupture of the cover plate of one of the latticed steel posts supporting the bridge in its center. The committee finds that the bridge received its regular inspection on November 18, nine days before the wreck and that the very day before the wreck a deflection test had been satisfactorily made. There had, in addition, been the usual daily inspection of track and bridge by track walkers and foremen. The committee reports that "We cannot definitely determine whether this rupture was due solely to the superimposed load or some antecedent cause, but there is the evidence of two witnesses that the first indication of the derailment occurred when the train was at a point immediately east of the bridge, where they saw a large amount of fire flying from under the lead engine on train No. 19. This, coupled with the evidence of both enginemen on train No. 19 that they made no application of the air brake at that point, would lead to the conclusion that the train struck an obstruction. The design of the structure prevented a disclosure of the rupture of the cover plate under the usual inspection, except at the front and rear ends of the plate where the accumulation of paint would have a tendency to obscure the same This detail fracture had no observable effect upon the stability or strength of the structure as is evidenced by the results of the deflection test made the day before the wreck occurred. This test was made with the bridge under load of passing trains and did not disclose any weakness in the structure."

Report of Indiana Commission on the C. H. & D. Wreck.

The Railroad Commission of Indiana, in its report upon the wreck which occurred upon the Cincinnati, Hamilton and Dayton Railroad at Irvington, on November 13th, does not attempt to fix the degree of personal responsibility for the wreck, but finds that it was due to the carelessness of the engineer and head brakeman of the freight train which had been ordered to take a siding to allow a passenger train from Cincinnati to pass. The train crew of the freight failed to close the switch after the train had passed on the siding, with the result that the passenger train ran head-on into the freight and sixteen persons were killed and many injured. The Commission finds that if the company had used steel cars in the ill-fated train that the loss of life would have been less severe.

BUREAU OF STANDARDS ON ADDITIONAL RAIL TESTS.

An interesting sidelight on the general question of improving the quality of rails is contained in the report of Dr. Howard, the Chief Inspector of Safety Appliances and the engineer-physicist of the Bureau of Standards in his report on the results of his investigation of the derailment on the New York Central near Hyde Park, New York, last March. In this report it is asserted that this wreck, like a number of others, was probably the result of streaks or seams in the steel. A large percentage of rail fractures occur in the crosswise direction, and it is contended that the present steel rail specifications do not require tests in the directions in which rails most commonly fail. It is asserted that the omission of crosswise bending tests is a serious matter and that the specifications should be revised to include such a trial

Mechanical

MECHANICAL TRANSFERRAGE AT RAILWAY SHOPS AND TERMINALS.

ALMOST timely topic, in view of the agitation and large plans now under way for the improvement of dock facilities in New York Harbor, was admirably treated by Mr. H. McL. Harding, consulting engineer of the Department of Docks of New York City, in his paper on "Mechanical Transferrage at Railway Shops and Terminals," read before the meeting of the Western Railway Club, held on November 19th. In connection with this paper, Mr. Harding presented some interesting diagrams showing the ideal arrangement of freight terminals, the most important of which are reproduced herewith. After pointing out that the great advantage of mechanical transferrage devices must be found in the rapidity and economy with which they handle freight and the degree by which they increase the capacity of terminal facilities, Mr. Harding emphasizes the fact that there is no uniform plan which is most advisable under all conditions, but that it is necessary to make a careful study of terminal operating conditions in each case before adopting any machinery or determining upon the best plan. In some cases machinery can be most satisfactorily installed overhead, while under other conditions it is preferable to provide surface machinery or to locate it under the surface. Again, the various types of machinery possess varying advantages under different working conditions. In determining the question of the type of machinery that is best suited, the author states that any proposed machine should be tested according to three standards: "(1) that the machinery itself should be able to serve every cubic foot of space; (2) that the machinery should do this without any re-handling by manual labor; (3) that there should be continuous rapidity." The machine which most satisfactorily meets all of these conditions is the best machine under the circumstances. He pointed out that the traveling crane met admirably the first two conditions, but that it was not satisfactory under most conditions for use in terminal work because it was not sufficiently rapid. In addition, it was necessary for the designer of terminal piers and sheds to keep in mind the various classes of freight to be handled. The author found that there was a wide difference in the average weight of consignments, in their bulk and in the character of their product, all of which had a vital influence in determining the most satisfactory type of machine.

Having reviewed the various working conditions which are encountered, the author next proceeded to take up the various familiar forms of labor saving devices and outline the points of advantage and limitations of each. Mr. Harding also pointed out that the plan of the terminal itself, wherever possible, should be prepared after the particular type of machine which is found to be the best suited for the traffic to be handled has been determined in order that any special features in the construction of the building, which may be necessary to accommodate the particular type of mechanical conveyor, may be provided in the original construction, and in order that the building may be so planned as to admit of the most economical and expeditious handling of freight therein. The plans which he exhibited and which are shown in the accompanying illustrations indicate the most advanced thought of the Department of Docks of New York City concerning the best arrangement of a mechanically equipped marine terminal in that city. It will be noticed that the sheds have an auxiliary floor, or, in other words, that they are to a large degree two-story. Through these upper floors at proper intervals are located hatchways, enabling the conveyor to lower freight to the lower level, or, in other words, to the platforms on the level of the car

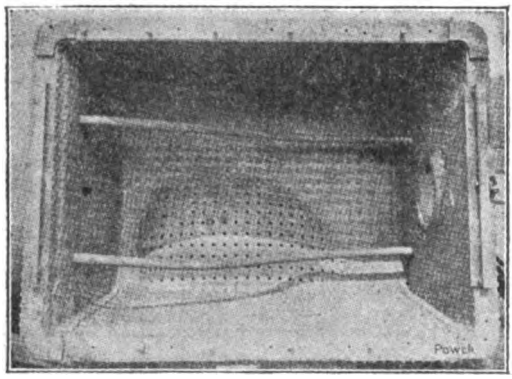
floors, or for loading drays and automobile trucks. The proposed plan provides a larger storage capacity than would otherwise be possible. The absence of pillars is a noticeable feature of the plan, the roof being carried on trusses, practically eliminating supporting posts. The arrangement of tracks is also interesting. The number of switches, it will be observed, has been kept down to the minimum and the curves, wherever possible, are made of long radius. The location of movable tracks for the mechanical handling of the trucks as contrasted with the fixed tracks for freight cars is an interesting detail. The proposed installation of a traveling crane with projecting loops for serving over all hatches and side ports is also an interesting feature.

FURTHER LIGHT ON RECENT FIRE BOX TESTS.

THE recent interesting tests held at Coatesville, Pa., to determine the relative advantages of an ordinary radial-stay fire box as contrasted with the sectional type of fire box (the Jacob-Shupert fire box) have aroused considerable discussion among railway men. A recent meeting of the New York Railway Club was given up to a discussion of this subject and to a paper thereon by Mr. A. W. Whiteford. It will be remembered that these tests were for the purpose of determining, first, the relative steaming qualities of the two types of boilers, and, second, the relative safety of the two boilers where unusually low water prevails and the crown sheets are bare. These tests were made under the direction of Dr. W. F. M. Goss, of the University of Illinois Engineering Department. The tests showed, in brief, that at ordinary rates of power both types of fire box give practically the same economy and the same percentage of tonnage evaporation for the entire boiler. At higher rates of power, the sectional construction shows a slightly better rate of efficiency when coal is used as fuel, but when oil is used as fuel, there appears to be no difference in the evaporative performance. The second series of tests to determine the relative safety of the two types of boiler under low water conditions were the most interesting. In these tests, the water was gradually evaporated until there was either a failure of the boiler, as occurred with the radial-stay type, or there was so little water remaining that sufficient steam could not be generated to operate the blower in the stack, as was the case with the sectional type The effect of these tests upon the fire boxes of the two boilers is shown in the accompanying illustrations. The radial-stay boiler, as is clearly shown, failed under the low water test. There was a violent explosion which raised the rear of the boiler, blew out the arch brick, tore loose the cast iron pedestals and disrupted the brick work under the boiler. As is seen by the illustration, a considerable section of the crown failed—in all, 188 crown stays and stay bolts gave way. The button-headed stays failed by breaking at the sheet and the flat-headed stays pulling through the sheet. The sheet itself

Digitized by Google



CROWN OR RADIAL STAY FIREBOX AFTER FAILURE.

did not rupture or crack. The contents of the boiler were discharged through the openings made by the stay holes, the aggregate area of which approximated 186 square inches. A considerable portion of the crown gave evidence of scaling from the effects of the heat.

As contrasted with the condition of this boiler, the sectional type, as has already been said, passed through the test successfully. Dr. Goss's examination led him to the conclusion that the boiler was in condition for operation after the test was concluded and that there was no doubt that, in so far as safety was concerned, the sectional type had demonstrated itself to be much superior to the radial-stay type. The crown sheet of the sectional boiler, as it appeared after the test, is shown in the accompanying illustration. It will be seen that it is intact—in fact, only one very minor leak developed.

Dr. Goss, in addition to conducting these tests, made a service inspection of sectional fire boxes which had been in use for some time upon various railroad systems. His conclusions from this inspection are as follows:

"1. The construction of the sectional fire box admits of easy and thorough inspection.

"2. The sectional fire box gives no trouble by leaking at the mud ring. Not a single case of a leaky mud ring could be found. The fireboxes give no trouble by leaking between sections.

"3. No indication could be found of grooving or cracking at the fillet or in any other part of the sections making up the fire box.

"4. The fire boxes examined, while very large, appeared to resist perfectly the pressure imposed, which in all cases was above 200 pounds.

"5. The fire box structure of a sectional boiler after a year of service in a district of alkali water appeared as though new, while that of a radial-stay boiler in the same service, for the same or a lesser length of time, presented unmistakable evidences of degeneration.

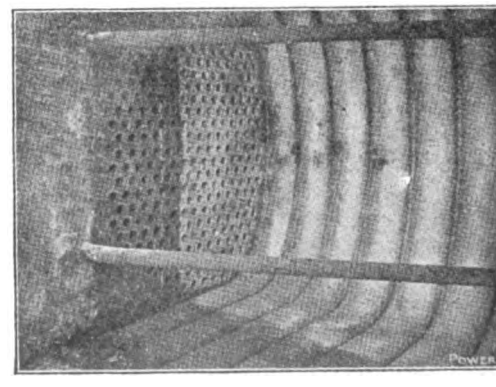
"6. Evidence was not lacking to prove that minor defects, such as those which may arise in a sectional boiler from accumulation of scale or because of low water, are easily repaired.

"7. Since the inspection, it has been reported that defects have appeared in some of the older sectional boilers. These have arisen from the faulty arrangement of longitudinal stays. In the boilers affected, the back head is braced by comparatively short stays, secured to certain of the outside or wrapping sheet sections. The sections being curved, are not well situated to meet the loads imposed by the stays, and it is not surprising that some of them have suffered. The obvious remedy is to be found in extending all longitudinal stays through to the throat sheet, or to the barrel of the boiler. By so doing, they will be removed from connection with the sections."

The discussion before the New York Railway Club of the results secured by sectional fire boxes was very interesting. The chief objection heretofore made to the sectional firebox was that it is difficult to clean; that scale and mud accumulate on the crown sheet and in other places, and that it cannot be dislodged in the ordinary manner. Mr. A. McGill, Shop Superintendent of the Lehigh Valley Railroad at Sayre, Pa., stated that he had under his jurisdiction three 10-wheel freight locomotives equipped with sectional fire boxes which had been in service five months and had made approximately fifteen thousand miles, or one-third of the normal distance made by locomotives of this type between shoppings. Continuing he stated that "We have been informed by critics of the fire box that we would have difficulty in washing the boiler and various other troubles; therefore, we studied the matter very carefully in advance, and, in our opinion, there were some objectionable features, namely, the straight flue sheet and the method of securing or tieing the sheets at the mud ring. These features we have overcome by using a flanged flue sheet and by having the sections butt jointed at the mud ring, and by welding the same by the oxy-acetylene process, which practically made continuous sheets inside and out.

"We found no difficulty whatsoever in washing out the boilers, and did not have to employ any means of washing other than the common method employed in any roundhouse, namely, the water pressure, hose and nozzle. Little, if any, scale accumulated during the five months the engines were in service. We were, however, prepared to remove it very easily by simple methods. We found we could remove the scale by the insertion of a chain through the washout plug holes, and by simply rattling the chain back and forth, reach the rivet heads and seams.

"Aside from the regular inspection of the boilers, as they were being washed, we have had several special inspections to learn what was taking place in the way of scale formations. From these inspections, our conclusion was that scale forms very much less rapidly than in the radial-stayed



CROWN OR SECTIONAL FIREBOX AFTER LOW WATER TEST.

Digitized by Google

boxes, as we found more scale in other types of fire boxes which were put in service about the same time the sectional boxes were, were run in the same districts, used the same water and were operated under the same conditions.

"We have not made any tests to ascertain what economy of fuel we obtained; but we are simply working out a maintenance test, putting the locomotives with these boxes in hard service and working them in comparison with other locomotives of the same weight. So far, the maintenance has shown up decidedly in favor of the sectional fire box, and we do not feel that we made any mistake in recommending a trial on our road."

MIKADOS VS. CONSOLIDATIONS.

THE Delaware, Lackawanna and Western has recently completed a most interesting series of tests concerning the relative economy of operation of a heavy and powerful class of Mikado type locomotive of the latest design and of the Consolidation locomotive of the ordinary conventional design, which has been used by this company for a number of years. The tests were not, strictly speaking, scientific in character, but were simply working comparisons to determine the relative efficiency of the two types of locomotives with respect to fuel and water consumption, loads and speeds under the same operating conditions. The observations were made on the Buffalo division between Elmira and East Buffalo, a distance of 141 miles. Records were kept of four runs of each class of locomotive—two in each direction. The Consolidation locomotives were comparatively new and had been in service only a year and were in good repair. So far as age and condition were concerned, the advantage was in favor of the Mikados, for they were new, having just been received from the American Locomotive Company. Offsetting this advantage to a certain degree, was the fact that the enginemen were not entirely familiar with the operations of the new locomotives. Two firemen were used on the Consolidations, in accordance with the regular practice, while one fireman handled the Mikados. In the test no attempt was made to set up special conditions, the regular crews being used and they being instructed to follow their ordinary methods.

The general result of these tests showed a saving of from 29 per cent to 32 per cent in coal and 27 per cent in water per ton mile in favor of the Mikados, although these locomotives were 32 per cent heavier.

Taking as the basis of comparison, first, the average results of the total distance traveled in the trials, in other words, the two westbound and the two eastbound trips, the comparative performance was as follows: The Mikados steamed freely and handled the train perfectly at all times. They burned from 19 per cent to 21 per cent less coal per trip than the Consolidations and they pulled from 11 per cent to 16 per cent heavier trains. On the westbound trips there was little difference in the total running time as between the two types, although the Mikados averaged forty minutes less delayed time. On the eastbound journey, the Mikados took heavier trains over the road in considerably less time than the Consolidations

Considering only the comparative performance of the two classes of locomotives westbound between Elmira and Wayland, the Mikados showed the ability to haul an 11 per cent heavier train at 2½ per cent higher speed and of 23½ per cent less coal consumption than the Consolidations. The stretch of 62½ miles consists of an easy ascent averaging about 0.2 per cent, with some short down grades and level stretches. The comparison of the results secured between Groveland and Wayland, a distance of 14 miles, all but two miles of which is an ascending grade averaging 1.09 per cent, in which Consolidations were used as helpers for both classes of locomotives, it was found that the Mikados hauled practically 18 per cent more tonnage than the Consolidations at the same speed, and burned a little less coal. The Mikado type locomotive represented the latest product of this class of the American Locomotive Company, being equipped with fire tube superheaters, having a superheating surface of 1,085 square feet, and brick arches. The Consolidations used in the test had neither superheaters, nor were they equipped with brick arches. They represented as to type the common conventional practice for such locomotives.

FACTORS IN THE SELECTION OF LOCOMOTIVES AS REGARDS ECONOMICAL OPERATION.

MR. O. S. BEYER, of the Rock Island lines, in a paper before the American Society of Mechanical Engineers, has outlined most fully the various factors which should be considered in the selection of locomotives with respect to economical operation under varying conditions After reviewing briefly the various physical conditions under which locomotives are used and which must have an influence upon their design and character, Mr. Beyer reviewed briefly the various types and sizes of locomotives now in use, at the same time indicating generally the conditions under which each type is used. He also brought out some of the main limitations upon each type of locomotive and showed how these limitations frequently made it unwise for a railroad to adopt a particular type which might give excellent service upon some other road having slightly different characteristics. The author has collected and presented in connection with his report interesting tabular information concerning the dimensions of certain typical types of locomotives. It was the belief of the author that the determination of the type of locomotive most economical under any given condition was one that could be arrived at from the results of tests and information derived from the records of the company. A great deal of this information could be secured by the careful selection of statistical data where a given type of locomotive was used by another railroad company operating under approximately the same conditions. Once this information was collected—and Mr. Beyer advocated that it be gotten by each item of operating expenses as provided in standard accounting classifications prescribed by the Interstate Commerce Commission —it would be possible to arrive at an accurate re-

Digitized by Google

sult. He declared that "Taking each one of the items into consideration, estimating the reduction in train mileage effected by each type, the gross savings in operating expenses effected based on the amounts of business on hand or in sight, and deducting therefrom all overhead charges arising from the additional improvements necessary to make the operation of the different types of locomotive under comparison practical, will reveal which particular locomotive is the most economical in size and type.

"As far as a standard engine of any kind for an entire road is concerned, the general conditions obtaining will have some bearing A road may, for instance, be composed partly of divisions whose grades are moderate and partly of divisions whose grades are severe. If the variations are not great, a compromise standard might be adopted. If, on the other hand, there is a large difference, it may be wiser to seek to establish two or three standards and confine each to a particular territory with a view to getting the maximum efficiency from every portion of the property. Then again there are many shorter territories, such as pusher grades and divisions through mountainous country, the motive power selection for which is a distinctly local problem. In every case, whether it is the broad problem of establishing standards for the entire system, or selecting an engine for a local territory, the problem might well be reduced to an economic study, comparing several available types and sizes, the extent of the improvements necessary to make their operation practical, and the net savings which it is estimated will be effected by their introduction.

Summary.

"In designing new locomotives, all of the conditions must first be analyzed and then the design made to suit them. The actual design of the engine finally chosen may be approached with confidence because of accumulated knowledge and experience. Due to the great possibilities of favorably effecting operating results by building locomotives which are exactly suited to their work, a study of the conditions becomes vitally important. The fact that the most powerful locomotives of most approved design are also the most economical should be more generally appreciated. It is to be hoped that the future will see more advantage taken of the modern locomotive in accordance with its possibilities in relation to grade revision and its ability to reduce operating expenses to a minimum. The ultimate benefits which will result will certainly be justified to the fullest extent"

INTERESTING EXPERIMENTS WITH HIGH-SPEED PASSENGER LOCOMOTIVES.

SOME most interesting information concerning the comparative advantages of Atlantic and Pacific type locomotives, of different models for high speed service was furnished by Mr. Gaetano Lanza, of the Baldwin Locomotive Works, in a paper read before the Franklin Institute, and appearing in the Journal of that society for December, 1912. The tests in question were made by the Baldwin Locomotive Works for the purpose of determining the relative efficiency of four locomotives, the first of which, No. 675, was a three-cylinder, 19 inches by 24 inches; 74-inch drivers; 10-wheel Pacific type (4-6-0) locomotive weighing, with its tender, 178 tons; using steam of a low degree of superheat and hand-fired. The characteristics of the other three locomotives were as follows:

No. 300: 3-cylinder, 19 inches by 24 inches; 80-inch drivers; Atlantic type (4-4-2); weighing with tender 172 tons; using steam of a low degree of superheat and hand-fired.

No. 301: 2-cylinder, 22 inches by 22 inches; 80-inch drivers; Atlantic type (4-4-2); weighing with tender 170 tons; using steam of a low degree of superheat and hand-fired.

No. 302: 2-cylinder, 22 inches by 26 inches; 80-inch drivers; Atlantic type (4-4-2); weighing with tender 170 tons; using saturated steam and hand-fired.

All of the runs were made in regular service between Philadelphia and Jersey City, a distance of 90 miles each way; the locomotives being run on an express train in one direction and returning with a local in the opposite direction.

The summarized results of the tests were as follows:

No. of engine.	No. of trips.	No. of cars.	Average indicated horse-power.	Average dynamometer horse-power.	Average speed in miles per hour.	Average drawbar pull in pounds.	Average coal per indicated horse-power. Hour. Lbs.	Average coal per dynamometer horse-power. Hour. Lbs.	Average water per indicated horse-power. Hour. Lbs.	Average water per dynamometer horse-power. Hour. Lbs.	Degrees of superheat above boiler steam. (Fahrenheit).
675	3	8	1360	857.0	57.40	5414	4.50	7.13	28.0	44.36	51
		8	1293	816.7	54.93	5513	4.48	7.10	27.9	44.22	0

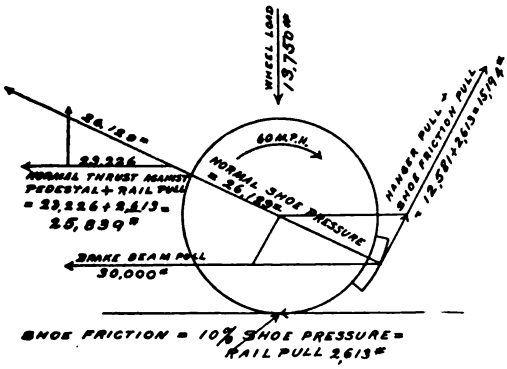
Digitized by Google

It will be seen by an analysis of the above table that engine No 300, or the 3-cylinder Atlantic type, exceeded the others included in the trial, especially the last two types, both in average dynamometer horse power and in the average drawbar pull. At the same time, the coal consumption of this locomotive per indicated horse power, was the highest of any of those used in the tests. The water consumption, on the other hand, per indicated horse power, did not run as high, per the case of some of the other locomotives, particularly the Pacific type engine and the 2-cylinder Atlantic type using a low grade of superheat. Professor Lanza did not analyze the results but simply presented them for the consideration of his auditors, nor did he attempt to indicate which locomotive, in his opinion, was best suited for the particular conditions under which the trials were made.

WHEEL SLIDING UNDER HEAVY PASSENGER EQUIPMENT.

THE increase in the weight of passenger equipment, resulting from the introduction of the steel car, has brought with it new problems for the mechanical department of which one of the most serious concerns the effect of breaking upon trucks and wheels. This subject has been given a great deal of study by Mr. John P. Kelly, of the New York Central, the results of which were presented in a paper read before the Central Railway Club. After reviewing the engineering theory, which must be kept in mind in connection with the question of the allowable brake shoe pressures, Mr. Kelly proceeded to take up the results of the application of this theory and of his study and observation. He pointed out that there was a tremendous advantage in favor of the trucks equipped with equalizing springs in passing over a track slightly uneven, as is necessarily always the case, as contrasted with the truck equipped with solid struts in place of such springs. It was his conclusion that wherever passenger equipment was used in high speed work that the equalizing spring was enabled to perform the service which it theoretically should perform, of allowing the wheel to drop quickly into slight depressions in the track. The result was that there was a temporary cessation of rail pressure, and the brake shoe, during this time, slowed down the wheel exactly as it did where a solid strut was used, so that when the wheel again hit the former level, it was going so slowly as to lock and skid until the train stopped.



The accompanying illustration shows clearly the stresses and strains to which the several parts of the truck are subjected under such conditions. According to Mr. Kelly, the stresses which prevent the proper action of the equalizing spring work out in practice as follows:

"When the wheel does not go to a lower point in the track, the equalizing spring would have a tension in it of 12,150 pounds (total weight the wheel carries to rail being in this case say 13,750 pounds) the spring supported weight, plus 5,447 pounds from the vertical pull of the brake hanger making a total of 17,597 pounds. This tension is resisted by the tension between the oil box and pedestal, 6,968 pounds, plus 12,414 pounds vertical pull, plus the shoe friction, 2,612.9 pounds, or a total resistance of say 21,994 pounds. This means that the equalizing spring has actually become a strut and cannot push the wheel downward and therefore the wheel can only get down as fast as gravity alone can take it, and, as shown this would permit the wheel to travel a distance of 30 inches horizontally over one sixty-fourth inch depressed track with practically no weight on it, and of course give the brake shoe all the chance needed to slow down very materially its rotation.

"While this illustration is an extreme one, yet it is closely approached in some instances in practice, so that with the equalizing springs unable to perform their functions properly, with the transference of weight from one pair of wheels to another in the same trucks during the retarding of the motion of the car and with the slippery condition of rail from frost and other causes, it will be seen that our margin against wheel sliding in heavy brake applications on heavy passenger equipment is about nil."

He believed that there was very little difference, with heavy equipment running at high speed, between the strut equipped brake and those fitted with equalizing springs, and that therefore there was little or no margin of wheel sliding against heavy truck balanced on heavy equipment running at high speed. It was his opinion that it would be necessary to design a type of brake and brake rigging which will interfere to a smaller degree with the equalizing springs and enable them to perform their proper functions with the same efficiency while the brakes are closed as while they are released.

SCIENTIFIC RAIL TESTS IN PROGRESS.

THE Rail Committee of the American Railway Engineering Association is engaged in making some exhaustive and very careful tests in conjunction with the members of the Civil Engineering Department of Lehigh University in the engineering laboratory of that institution. The tests are, in a sense, a co-operative arrangement by which the manufacturers of steel rails furnish the material and facilities for research work and the railroads and the University fur-

Digitized by Google

nish the engineering skill to conduct the tests. Some of the results of these tests have already been published. The series of tests which are now going on involve the investigation of the rate of reduction of the cross-section in rolling from the ingot to the finished rail. One hundred pieces of 100-pound American Railway Association section two feet long are being used. The results of these tests will, no doubt, throw considerable light upon the causes of rail failures and the possibilities of improvement in the methods of manufacture.

SERVICE TESTS OF TITANIUM RAILS.

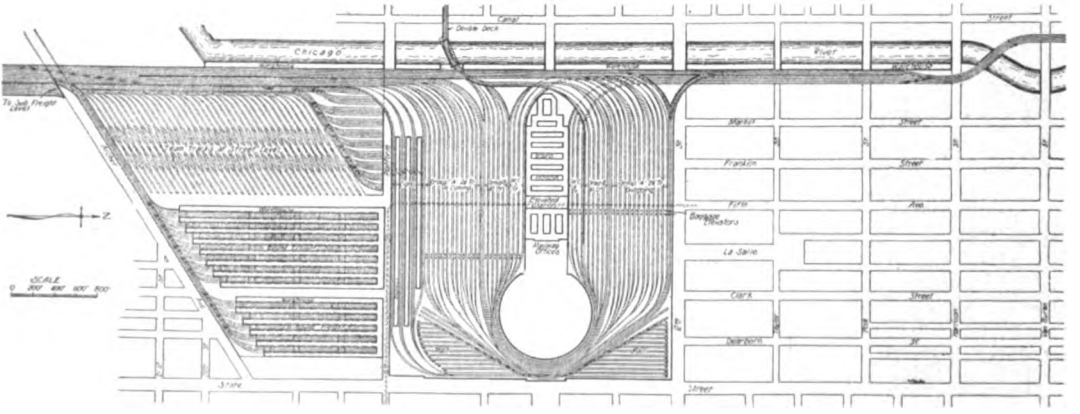
THE results of some interesting service tests which have been made by various railroads with titanium rails have been collected and published by the *Railway Age Gazette*. The first test reported was made by the Delaware and Hudson at Howe's Cave, New York, covering a period of 16½ months. This test was made on two curves. "Ordinary open hearth rails were laid on a 3 deg. 30 min. curve, while titanium open hearth rails were laid on a 4 deg. 8 min. The traffic over each curve was the same, and the weight of all rails was 90 pounds to the yard. On the high side of the curves, the average rate of wear was .2825 sq. in. for the plain open hearth and .1825 sq. in. for the titanium treated rails. For the low side of the curve, the plain open hearth showed an average wear of .145 sq. in. and the titanium treated, .09 sq. in. In the treatment of these rails .01 per cent of metallic titanium was used From this it appears that the rate of wear of the untreated open hearth rails was something more than 50 per cent greater than it was with the titanium treated rails."

A very similar test was made by the Boston Elevated Railway on a curve of 100 feet radius, for a period of 214 days. The service conditions at this point were so severe that ordinary rails wore out in a very short space of time. The result of this test showed, generally, that the wear of the untreated rail was about 50 per cent faster than that of the treated rail. The final test reported was that conducted by the New York Central on its Hudson River division. In this case no open hearth or Bessemer rails were used, the entire track being laid with open hearth titanium rails weighing 100 pounds to the yard, and laid on curves of 3 deg. and 2 deg. 15 min. These rails had been on the track for two years and had carried a total tonnage of about thirty-eight million tons, much of it at a very high rate of speed. "In the case of the 3 deg. curve, the wear on the outside rail at the worst place was .14 sq. in., or at the rate of .0037 sq. in. per 1,000,000 tons, while on the 2 deg. 15 min. curve it has been at the rate of but .0013 sq. in. per 1,000,000 tons. In the latter case, the wear has been the greatest on the inside rail, due probably to the heavy freight trains that passed over it.

These results are uniformly good and it should seem that with such a record there should be no hesitation in regard to the matter. However, there is a difference of opinion as to the benefits to be derived from the titanium treatment due to the fact that a few failures to secure the desired results, but only in Bessemer rails, have been reported. The failure of these rails, after a very careful and painstaking investigation, can be traced to the lack of care on the part of the mills in using the ferro-titanium in the proper manner. However, as a whole, the examples taken from practice go to show that the service which is being rendered by titanium treated rails is better than that of the untreated product, for which the simple claim is made that the deoxidation of the metal makes it more dense and, therefore, better able to resist wear, while at the same time, as it is stronger, it is less liable to break than the same grade of metal which has not been treated in this manner."

PROPOSED UNION TERMINAL IN CHICAGO.

THE vexed question of providing adequate terminal and freight facilities in Chicago for the various railroads centering therein, which has brought forth many suggestions, none of which so far have apparently won the approval of the various parties interested, has prompted Mr. Jarvis Hunt, of Chicago, an architect of considerable experience and prominence, to propose



(Courtesy of the Railway and Engineering Review.)

PROPOSED CHICAGO TERMINAL.

Digitized by Google

a plan for a Union Terminal, the main details of which are shown in the accompanying cut. This proposal has the advantage that no additional real estate must be acquired by the associated railways, their present holdings between State street, Canal street, Thirteenth street and Sixteenth street being utilized. In order to make this tract available, it is proposed that the Chicago River be diverted from its present course in this vicinity by eliminating the curve which now exists at this point,—in other words, a cut-off would be dug, moving the river over almost to Canal street. This would enable a large terminal to be located with its center almost where the maximum curvature in the river is at present. Mr. Hunt's plan calls for a joint passenger and freight terminal, built on the loop principle, with a sepaarte set of platforms for in-coming passengers and other sets of platforms for out-going passengers. The present railroad business of Chicago amounts to 118 passenger trains per hour. The new terminal contemplated in this plan would accommodate not less than 600 trains per hour. The freight station facilities of the city have now about 3½ miles of platform accessible to wagons. The new terminal would provide 21 miles of wagon accommodation at the freight house. In fact, the new station would increase the passenger and freight facilities about six-fold. Mr. Hunt believes that funds for the construction of this terminal could be provided entirely from the sale of land now occupied for station purposes, which would be released by this consolidation movement. The plan involves the substitution of electricity for the present motive power in both freight and terminal work. This feature of the proposal is a more serious matter than that of the terminal itself, for the large expenditure which would be involved cannot even be estimated until a careful study has been made of the question.

PROLONGING THE LIFE OF CROSS TIES.

MAINTENANCE of way engineers will be much interested in the report of Mr. Howard F. Weiss, Assistant Director of the Forest Products Laboratory, upon prolonging the life of cross ties (United States Department of Agriculture, Forest Service Bulletin No. 118). This report goes thoroughly into all of the various methods of tie preservation heretofore generally used and gives, by way of illustration, the results secured, in so far as ascertainable, with each process. The various factors which lead to failure with each method of tie treating is explained, together with some suggestions by which these errors may be avoided. On the whole, therefore, the report is a condensed text on the subject of tie preservation and the way in which it should be handled. Considerable space is given to the subject of tie plates and the advantages resulting from their use in connection with treated ties. The various factors which enter into the question of a satisfactory tie plate and the advantages arising from the use of various kinds of spikes for rail fastening are gone into with considerable detail.

in importance in direct proportion to the number of ties treated with preservative. Chief among these objections are (1) unequal bearing afforded tie plates and rails, (2) lack of uniform volume, and (3) unnecessary waste of valuable material."

Getting down to the results secured from treating ties, the author states that "practically all of the ties now treated in commercial plants in the United States are injected with zinc chloride or with creosote, either alone or in combination. Only a few plants use preservatives like crude oil and mercuric chloride It is customary to inject about one-half pound of dry zinc chloride per cubic foot of wood, although this varies at times from one-third to two-thirds of a pound. This salt costs from 3⅞ to 5 cents per pound. Creosote costs from about 6 to 10 cents per gallon in large quantities. It is customary in tie work to inject from 5 to 12 pounds of this oil per cubic foot."

The following figures are presented showing the cost of tie treating under average conditions by each method:

APPROXIMATE COST OF PRESERVING TIES (7" BY 9" BY 8').

Kind of Treatment.		Cost of Treatment.					
Preservative.	Amt. injected (per cu. ft.)	Seasoning.	Labor.	Fuel.	Maintenance.	Chemicals.	Total.
Creosote	10	$0.01	$0.06	$0.01	$0.015	$0.279	$0.375
do	6	.01	.06	.01	.015	.168	.263
Zinc chloride	½	.01	.06	.01	.016	.070	.166
Creosote Zinc chloride	3 ½	.01	.06	.01	.016	.154	.250

HEWED VS. SAWED TIES.

Concerning the much-mooted question of the relative advantages of hewed vs. sawed ties, Mr. Weiss comments as follows: "The claim is often made that hewed ties are more durable than sawed ties because they shed water better. Nothing is known by the Forest Service to substantiate this impression. Even if untreated hewed ties should be more durable than sawed ones, this advantage disappears when the ties are treated. On the other hand, there are many serious objections to the use of hewed ties, and these are increasing

As to the increase in durability of treated ties as compared with those which are untreated, Mr. Weiss states that, generally, the treating of ties prolongs their life from 100 to 500 per cent. "With zinc chloride, which is a soluble salt and tends to keep the ties moist, and hence weaker under repeated impact and compression, this increase in life will probably be somewhat less."

Railroad men will be interested in the results of his investigation as to the experience of various railways with treated ties. The following table contains the author's investigation of this point.

Digitized by Google

Species.	Laid by—	How treated	Life. Years.
White oaks	Duluth & Iron Range Ry. Co.	Untreated	8 to 9
Spruce	Union Ry. Co. (horse)	Burnettized	8 to 20
Pine (probably western yellow, longleaf, and pinon pines)	A., T. & S. F. Ry. Co.	do	10½ to 15
	T. & N. O. Ry. Co	do	10 to 11
	H. & T. C. Ry. Co.	Creosoted	19
Baltic pine	English railroads	do	8 to 18
Hemlock	C. R. R. of N. J.	do	15½
	C., R. I. & P. Ry. Co.	Wellhouse	10 to 15
Tamarack	Duluth & Iron Range Ry. Co.	Burnettized	8 to 10
	do	do	9 1-5
	Pittsburgh, Ft. Wayne & Chicago Ry. Co.	Wellhouse	8.84
Beech	French, German, and Austrian railroads.	Untreated	4 to 5
		Burnettized	10 to 12
		Creosoted	18 to 30
Maple	C. R. R. of N. J.	Burnettized	15+
	German railroads	do	16
Red oaks	Wabash R. R.	do	5 to 6
	French and German railroads	Creosoted	19 to 25

The conclusions of the author, which represent the results of investigation by the Forest Service over a number of years, are interesting and valuable. Mr. Weiss does not desire to have these conclusions taken as representing the final results which can be obtained, for he frankly states that the subject is one in which a large amount of experimentation and observation is yet to be done. Summarized, his conclusions are as follows:

(1) That winter cutting of ties should be encouraged because there is smaller danger of insect injury and decay. Bark should be removed from ties immediately after they are cut.

(2) Preference should be given to sawed ties because there is a smaller forest waste and they are more satisfactory in actual use; if ties are to be adzed or bored, this should be done before they are treated; all ties should be thoroughly seasoned before treatment, and, if possible, air seasoning should be used.

(3) It is always cheaper to use treated than untreated ties, except, perhaps, where black locust, redwood, cedar and cypress ties are available in nearby localities.

(4) In selecting ties for treatment, preference should be given to those which are hard and which absorb the preservative readily. Treated red oak, beech, maple and gum ties will give better service than treated chestnut, spruce and white pine ties; sapwood is just as strong as heartwood and much easier to inject with preservatives.

(5) At present it is not known definitely what preservative or process is most economical in all cases. Preservative should be analyzed frequently, as it changes considerably after a number of treatments.

(6) A nine-sixteenth inch diamond-pointed cut spike, if driven into a previously bored hole three-eighths to seven-sixteenths inch in diameter, will hold better than an ordinary cut spike driven directly into the tie.

(7) From the results thus far obtained, it appears advisable to use screw spikes wherever possible; where used, a hole should be first bored deeper than the maximum penetration of the spike.

CAR SHORTAGE LESS SEVERE.

IT is gratifying to be able to record that according to the statistics issued by the American Railway Association there is a decrease in the car shortage which was threatening to become a very serious matter. The report as of December 14th, shows that there is a net shortage of idle cars on the lines of the United States and Canada of 34,392 as compared with a shortage of 51,112 on November 21st. In other words, there has been an improvement in conditions of 16,720 cars, most of which are box and coal cars. An analysis of the statistics show that the increase in flat car surplus is general throughout the country except in a few States in the Southwest. Coal car surplus also shows a general increase. The increase in box car surplus has occurred generally in the Western and Southern States. The decrease in box car shortage is general except in some South Central States and on a few Canadian lines. The decrease in coal car shortage is also general with the exception of in the Virginias and the Carolinas and the extreme Western States. While under normal conditions it was to be expected that there would be a decrease in car shortage during the period under review, yet the results, as a whole, are very encouraging, and as a criterion of the activity of business, it is one of the most encouraging signs which can be pointed to. The record of car surplus and shortage for practically the entire year is shown graphically in the accompanying chart:

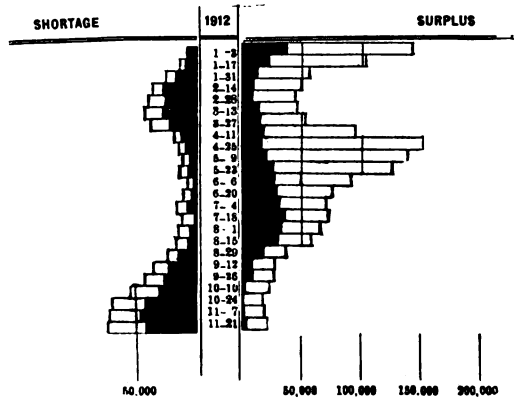


DIAGRAM OF CAR SHORTAGE AND SURPLUS DURING 1912.

Electrical

DENVER AND RIO GRANDE TO ELECTRIFY ITS MOUNTAIN LINES.

ONE of the most important announcements which has been made by a railway management in the calendar year just closed was that of Vice-President Brown of the Denver and Rio Grande Railroad, that this system would immediately begin the electrification of its mountain lines. This is the first transcontinental line to utilize electricity on a large scale in train operation. The first unit to be electrified will be from Helper, Utah, to Salt Lake City, 114 miles. The second unit will be over Tennessee Pass, the great Continental Divide in Colorado, and will involve the electrification of the line from Salida to Minturn, Colorado, a distance of 87 miles.

The Utah work will be commenced early in 1913, and it is hoped that it will be completed by the time the new two per cent detour line over Soldier Summit is finished, in July of this year. The Utah Utilities Company is to furnish the power for the Utah lines, and the Central Colorado Power Company will probably furnish the electricity for the Colorado lines. The cost of the improvements to be undertaken by the Denver and Rio Grande, the Central Colorado Power Company, and the Utah Utilities Company will aggregate between twenty and twenty-five million dollars, most of which will be required in 1913 and 1914.

It is anticipated that other units, in addition to the two mentioned, will be added from time to time, and that perhaps eventually the entire system will be operated by electricity generated by the great power in the torrents now coursing down the mountain sides and which is only waiting to be harnessed.

This transition from steam to electric power is by far the most important plan yet announced by the new management of the Denver and Rio Grande.

ELECTRIFICATION FOR 1912 AND THE OUTLOOK FOR THE NEW YEAR.

AT the end of the year 1912, it is interesting to compare the plans which are now under way, or have been announced, for the electrification of railroad lines as recorded in the "Electrical Railway Journal."

"In the order of their importance and considering now only railroad electrification in America on main-line roads, for complete passenger and freight service over full engine stages, at the end of 1913 the following showing will be made:

"The New Haven electrification will be completed between New York and New Haven; also on one of the most extensive freight switching and classification yards in the country on the Harlem River-New Rochelle branch and on the Boston and Providence four-track main line in all about 650 miles of electrified and single track road.

"The Denver and Rio Grande Railroad will have from 115 miles to 215 miles of electrified track.

"The next important electrified railroads in America, in the same class, are now the Piedmont and Northern, 130 route miles; Illinois Traction, 417 route miles; Fort Dodge, DesMoines and Southern, 130 route miles, Northern Electric Railway of California, 116 route miles, and the well-known Spokane and Inland Empire Railroad, with 183 route miles—five roads in which the freight, express and switching revenue tends to equal or exceed the passenger revenue.

"Further down the list are the West Jersey and Seashore and similar heavy passenger roads without electric freight service, following which come many short electric freight and passenger railroads and the switching and terminal roads.

"Considerable money is being spent on electrification. The Prussian State Railroad administration has ordered 568 locomotives for the complete freight and passenger service on the Berlin Stadtbahn, which will extend many miles out in the country, and a liberal appropriation has been added for the Magdeburg-Leipzig road. The French Western Railway administration has recently ordered 100 electric locomotives.

"The New Haven Railroad directors have this year expended about $12,000,000 for electrification. The Boston and Providence Railroad has authorized an expenditure of about $7,000,000. The Butte, Anaconda and Pacific directors have authorized an expenditure of $1,000,000 for the electrification of their short freight and passenger road, but here the heaviest part of the work, on the grades, will still be handled by steam locomotives. The Denver and Rio Grande Railroad has appropriated $6,000,000 for electrification, and this will require the Utah Utilities Company and the Central Colorado Company to expend equal amounts in increasing their equipment to furnish electrical energy to this road and to other roads in Utah and Colorado which are to be electrified.

"Altogether the outlook is good. One of the favorable features in connection with the electrification of several roads is found in two newspaper statements, one by Vice-President Byrnes of the New Haven road, who, with reference to the Boston and Providence electrification said: 'This is not a compulsory electrification, but is done because it ought to be done to increase the efficiency of the road,' and the second by Vice-President Brown of the Denver and Rio Grande, who stated, 'Our plans are in the interest of economy in operating expenses.'"

GAS-ELECTRIC CARS UNDER CONSTRUCTION.

THE General Electric Company has under construction in its Erie shops a considerable number of gas-electric cars for various railroad systems. Cars are being built for the Missouri and North Arkansas; the Texas Midland; the Pittsburg and Lake Erie; the Rock Island, and the 'Frisco systems. The 'Frisco system is one of the largest users of this type of car, having seventeen of this type running regularly on its branch lines. It is stated that 40 per cent of the roads which have heretofore ordered this type of car have placed orders for additional cars after observing the operations of the first consignment.

WIRELESS LOOOMOTIVE OONTROL.

RAILWAY officials are much interested in a test now being conducted by the Canadian Pacific Railway on a stretch of line in the suburbs of Toronto of a safety wireless device of locomotive control which would make it impossible for an engineman to run past a danger signal or over a broken rail or into an obstruction. The section of track on which the test is conducted is two miles in length, with a westbound grade of about 1 per cent. Over this line about 30 passenger trains and a much larger number of freight trains are operated every twenty-four hours. The stretch of track used in this test, was divided into four blocks or sections, varying from 2,500 to 4,500 feet. These were separated by the usual method of insulator joints. A wooden trunking containing the wires is laid midway between the rails and runs the length of each block. At the end of each block is a generator of wireless waves of very high frequency. The operation of this system of train control is described by Allan G. Wood, consulting engineer of Railway and Locomotive Engineering, who witnessed a portion of the tests, as follows:

"This generator of wireless waves is controlled by the alternating track circuits of the block in advance, and as long as the block in advance is not short circuited or broken, the wave generator which it controls is sending high frequency wireless waves along the blocks in the rear. A broken rail or open switch will stop the wave generator which it controls, thus placing the block in the rear at danger, by the absence of the wave.

"On the engine, which is equipped with the receiving apparatus, are four harps or antennæ. The main harps are located one under the center of the engine and the other under the tender, the one under the engine being sixteen feet long and the one under the tender twelve feet long. These harps contain each twelve copper wires and are suspended about eight and a half inches above the trunking in the center of the track. There are also two other antennae known as the counterpoise or pickup antennæ, one under the right hand steam chest of the engine and the other on the left hand side between the axle boxes of the tender. These harps are raised the same distance above the track as those under the center of the engine.

"Connected to these harps ars highly insulated wires which run to the apparatus on the running board of the engine, immediately in front of the cab. These wires are connected with tuning coils to which are connected the wireless wave responder. . . . . The responder operates the master relay, which in turn energizes the solenoids and controlling valves on the whistle line in the cab, the train line valve, the airbrake system and the bull's eye flashlights in front of the engineer in the cab The energy for the engine apparatus is supplied by two 250 ampere hour storage batteries which have to be renewed about once in three weeks."

Describing the tests which he witnessed, and which consisted of running a train of thirteen cars at an estimated speed of 20 miles per hour, through the blocks under varying conditions, Mr. Wood states that:

"When the train passed onto the pickup wire at Parkdale subway the whistle on the cab ceased blowing, the red light went out and the green light was shown in the bull's-eye.. The speed was gradually increased as the grade was climbed until an estimated speed of forty-five miles per hour was attained.

"By this time, the train was in the Wallace Avenue block, near Bloor street, when a motor car was purposely run into the block in advance at Royce avenue, this being the surprise danger test of signal. The green light extinguished, the red light illumined, the whistle started to blow, the train line valve was opened and automatically the brakes started to apply. During all this time the throttle was wide open, the steam gauge registering 180 pounds, the engineer's airbrake valve being in running position. The airbrake gauge showed a gradual reduction in the train line of eighteen pounds in thirty seconds, and the train was brought to a standstill in thirty-five rail lengths."

Several other similar tests were made and the same general results secured in each. According to Mr. Wood, "The maintenance of this system per block since the first of June, 1911, as shown by the records, has been five cents per day, power being purchased The cost of installing the engine apparatus varies from $250 to $500 per engine."

PENNSYLVANIA TO TRAIN MEN IN OPERATION OF MOTORS.

EMPLOYES of the operating department of the Pennsylvania Railroad in Baltimore have been instructed to report in Philadelphia at regular intervals for the purpose of receiving instructions in the handling of electric motors. While no official announcement is made as to the reason for this move, the explanation generally ascribed for it is that it presages the electrification within the next year or so of the Philadelphia, Baltimore and Washington branch of the Pennsylvania system running between Philadelphia and Baltimore by the way of Chester and Wilmington and also to West Chester.

LONDON AND SOUTHWESTERN PLANNING ELEOTRIFICATION.

IT is officially announced that the directors of the London and Southwestern have approved plans for the electrification of their lines in the neighborhood of London. The work will be commenced next year and will be completed in about two years. It is believed that this move is prompted by the success of the London-Brighton and South Coast Railway, in winning back the traffic which it had formerly lost under steam operation to the electric tramways operating under municipal control.

NEW PENNSYLVANIA INTERURBAN LINE.

THE Lehigh Valley Transit Company, in conjunction with the Philadelphia and Western Railway, has opened a through express electric service between Philadelphia and Allentown, Pa., a distance of 62 miles. This line, a considerable portion of which was reconstructed for this purpose, is regarded as one of the finest electric railways east of the Allegheny Mountains. In every town through which the line passes a commodious depot will be built and baggage carried under the same rules as by steam roads. The round trip to Allentown is $1.00 less by the electric than by the steam lines

The Interstate Commerce Commission

THE COMMISSION'S ANNUAL REPORT.

DECEMBER was a busy month for the Interstate Commerce Commission, numerous hearings were held and a large number of orders and decisions published. Among the important developments was the transmission of its annual report to Congress, a large part of which is devoted to an analysis of the causes of casualties in railroading. This feature of the report will be found more fully dealt with in another section of this issue, as will other important matters discussed. The Commission hold substantially that many of the accidents resulting in fatalities might have been averted by the employment of suitable devices and good equipment. It might be pertinent to suggest in this particular that had the Commission adopted a more liberal policy with regard to railway freight rates, and had the railroads not been compelled to exert the utmost conservatism in the employment of capital for improvements and equipment, that the period under discussion might have shown more favorable results.

The report states that the Commission's investigation "has proceeded far enough to indicate a need of more effective measures than thus far have been taken to secure the safety of railroad travel." Unquestionably, the railroads are in hearty accord with all measures which will help to bring about such a result, but it is becoming more apparent that one of the effective means for accomplishing these much needed reforms, would be to permit the railroads to earn sufficient to handle these problems without any sense of restriction. When all is said and done, it is largely a matter of dollars and cents, and to force the railroads to drastic economies in order to produce the results required of them by their security holders, is a case of "robbing Peter to pay Paul," and must inevitably react to the disadvantage of the general public.

LATEST ACCIDENT BULLETIN.

According to an accident bulletin issued by the Commission, the number of persons killed in train accidents during April, May and June, 1912, was 148. The injured totaled 3,924. Accidents to employes and others, due to railroad operations, including industrial accidents totaled 19,848. Of this number 2,363 persons were killed.

The total number of casualties on steam roads, for the year ended June 30, 1912, was 180,123. Of this number 10,685 were killed. This shows an increase of 189 killed, and 19,879 in the number injured, compared with the previous year.

For the three months, April to June, inclusive, there were 8,215 derailments, of which 1,857 were due to defects of roadbed, and 3,847 to defects of equipment.

During the fiscal year 318 passengers were killed, or 36 less than the year before; 3,635 employes were killed, or 33 more than in 1911: the 6,632 others killed, trespassers and non-trespassers, were 192 more than the year before. Of these, 5,434, or 82 per cent, were trespassing when overtaken by accident.

Number of employes now reported is 1,729,144, or 81,111 more than reported last year. During the year to June 30 last, one employe was killed for every 476 employed, and one injured to every 12, as compared with one in 458 and one in 13 for the 1911 year.

DEFECTIVE LOCOMOTIVES.

A report of much interest to those in the operating and mechanical branches of the railroads was that issued during December by the Chief Inspector of the Commission, covering locomotive inspection for the fiscal year ending June 30, 1912. This report will be found discussed in greater detail in another section of this issue. It shows in brief that during that period 48,768 locomotives were found defective, 3,377 were ordered out of service for repairs and 698 were ordered to be permanently removed. The report says that only 170 out of approximately 2,200 carriers complied with the provision of the locomotive boiler inspection law which required all carriers, within three months from the effective date of the law, to file with the Chief Inspector their rules and instructions for inspection.

UNIFORM BILL OF LADING.

A further investigation into the subject of bills of lading is to be undertaken by the Commission. A list of questions has been sent to all railroads asking for specific data to be furnished by January 15. In June, 1908, the Commission recommended the adoption of a uniform bill of lading which had been decided on by a committee of shippers and carriers. It is understood that this bill has been generally accepted and used by the roads in Official and Western classification territories, but has not been adopted to any great extent by roads in Southern classification.

Among the questions sent to the roads the Commission asks: "Do conditions on your line or on the line serving you warrant a different form? If so, wherein do such conditions differ from those on the lines of carriers in Western and Official classification territories which have adopted the proposed form?

"What valid reason is there why the Commission should not prescribe the proposed form as a uniform bill of lading for all carriers?

"What general or specific suggestions have you to offer upon any phase of the general question of bills of lading?"

EXPORT BILL OF LADING.

In denying the claim of the Galveston Commercial Association for reparation on account of demurrage charges which complainants have been compelled to pay during the past two years, the Commission has decided that it has no direct authority to require the issuing of a through export bill of lading, since it has no jurisdiction over the water carrier.

It is not unreasonable, the Commission holds, to require of the carrier to ascertain before receiving cotton for transportation to Galveston for export whether it can be cared for at Galveston upon its receipt and the ship agent should be at once provided with a copy of whatever contract of shipment has been signed by the railway agent on his behalf.

The public interest requires the issuance of

Digitized by Google

these through bills of lading. The cotton crop of Texas cannot be handled without great inconvenience under any other system, and unless there is some strong objection that method should be maintained, but when the through export bill is issued the shipper cannot, as a practical matter, be made answerable for demurrage charges. This charge should be cast upon this ship agent upon such terms and conditions as will not impose upon him an unreasonable burden.

After January 1, 1913, no justification can exist for not imposing substantially equivalent demurrage charges at New Orleans and at Texas ports, which are imposed at Galveston, and it will be an undue discrimination not to do so.

IMPORT RATE CASE TO BE REOPENED.

The Commission has consented to reopen partially the import rate case, in order that the pleas of the Boston Chamber of Commerce, the Boston and Maine Railroad and the Boston and Albany Railroad to have their port placed on a parity with Baltimore may be heard.

Under the award of last spring,the first class import freight rates to Chicago were fixed at 75 cents per 100 pounds from Boston and New York, 69 cents from Philadelphia and 67 cents from Baltimore.

The Boston interests now demand as low a rate as Baltimore. Pending the new hearing, Boston's rate has temporarily been restored, by agreement, to 70 cents, the same as existed four years ago before the controversy began.

CHAIRMAN PROUTY ON HEAVY TRAIN LOADS.

At a hearing in Boston during the week of December 23d, on the petition of the Boston Chamber of Commerce, for a lower through rate from that city to Colorado and Utah points, Chairman Prouty took occasion to comment on the "tonnage train" idea which he stated was being overdone by the railroads throughout the country and particularly so in the New England section. He seemed disinclined to take up a thorough study of the causes for train delays in detail, as requested by Louis D. Brandeis, counsel for the Boston Fruit and Produce Exchange, but said that such a study will have to be made later in order to improve the service in general. Mr. Prouty expressed the opinion that freight could be handled more expeditiously in New England if lighter trains and lighter cars were operated, instead of waiting until a heavy "tonnage train" can be made up and run through, as is done in many instances throughout the United States. He called for statistics from the New England lines regarding their late trains, for the purpose of making comparisons with the train service of roads elsewhere, and informed the railroad men that it was quite a different matter to ask them how many trains were late instead of why the trains were behind time.

RULING ON LONG AND SHORT HAUL SECTION.

A new general order has been issued by the Commission under the long and short haul section of the interstate commerce act. In this instance all railroads are instructed that as to rates and fares which are covered by applications for relief from the provisions of the long and short haul section that were filed with the Commission before February 17, 1911, they may file changes in rates, until such applications are passed on by the Commission, under the following conditions, although the discrimination against intermediate points is thereby increased:

'A longer line or route may meet the rates in effect between the same points or groups via a shorter line or route when the present rates via either line do not conform to the fourth section, but are protected by applications as above described.

"A newly constructed line of greater length, publishing rates from or to junction points to meet the rates of more direct lines as provided in the preceding paragraph, may establish from and to its local stations rates in harmony with those established from or to junction points.

"Carriers whose rates between certain points do not conform to the fourth section, but are protected by applications as hereinbefore described, which rates have been made lower than rates at intermediate points to meet the competition of water or rail-and-water carriers between the same points may make such further reductions in rates as may be required to continue to effectively meet the competition of the rail and water or all water lines.

"Where rates are in effect from and to a point that are lower than rates effective at intermediate points, and such rates are covered by applications filed on or before February 17, 1911, carriers may extend the application of such rates to, or establish rates made with relation thereto at points on the same line adjacent or in close proximity thereto, provided that no higher rates are maintained from and to points intermediate to the former point and the new point to which the application of the same or relative rates has been extended.

"Where there is a rate on a commodity from or to one or more points in an established group of points from and to which rates are ordinarily the same, but the rate on the said commodity does not apply at all points in the said group, such rate may be made applicable to or from such other points.

"Where there is a definite and fixed relation between the rates from and to adjacent or contiguous groups or points, and the rates to or from one of said groups are changed, corresponding changes may be made in the rates of the other groups to preserve such relation.

"In cases where no through rates are in effect via the various routes or gateways between two points, and the combination of lawfully published and filed rates via one gateway makes less than the combination via the other gateways, a through rate may be established on the basis of the combination via the gateway over which the lowest combination can be made, and made applicable via all gateways.

"The Commission does not hereby approve any rates that may be filed under this authority, all such rates being subject to complaint, investigation and correction if in conflict with the other provisions of the act."

HARD COAL RATES UNDER INVESTIGATION.

The Commission has begun an investigation of the rates practiced and regulations governing the

Digitized by Google

transportation of anthracite coal, and has called upon all anthracite coal carrying railroads and their affiliated coal companies to furnish the Commission by March 1st detailed information as to their coal operations.

All the carriers are required to report the names of the coal companies owned or controlled by them and to submit an accurate statement of their mining and sales operations.

Specifically, the Delaware and Hudson Company and the Delaware, Lackawanna and Western are required to report as to their mining and sales operations, as these roads own and operate anthracite mines.

TRANSIT PRIVILEGE INVESTIGATION.

The Commission has begun a general investigation into the transit privileges, and will hear all parties interested or affected by such privileges upon any commodity. There are filed with the Commission many protests as to the manner and methods employed by the railroads carrying out the order of the Commission dealing with the regulation of transit privileges on grain, including the increase in charges that are exacted upon the movement of milled products of grain over what was formerly charged for a like movement of similar tonnage. These matters will be placed before the carriers at this hearing for such information or explanation as they may give.

There are also lumber interests that desire a further hearing on the question of transit. Moreover, cotton merchants have requested the Commission to hear their protests as to the operation of transit privileges under the tariffs of the carriers. The Commission will upon this occasion investigate all these matters.

INVESTIGATION OF MILEAGE BOOKS

An investigation into the mileage book regulations of practically all railroads east of the Mississippi and south of the Ohio and Potomac rivers has been ordered by the Commission. Complaint was made by the South Carolina Railroad Commission that existing regulations were discriminatory as between interstate and intra-state traffic. The railroads interested may file with the Commission on or before December 20, statements of their position with respect to the investigation.

REFUND OF OVER-CHARGE LAWFUL.

In a letter written by Commissioner Clark to officials of the Denver and Rio Grande, an opinion is expressed that a railroad is privileged to refund amounts which it collects in excess of lawful ticket or excess baggage rates on file with the Commission.

This opinion, Commissioner Clark points out, must not be construed as meaning that the Commission will issue a rule authorizing such adjustments. In each instance, he says, the matter should be referred to the Commission for final adjudication.

EXPRESS COMPANIES ORDERED TO FILE COMPLETE STATEMENTS.

The Commission has issued an order requiring the express companies doing an interstate business to file with the Commission by February, 1913, statements showing a comparison of the effect of existing express rates and those suggested by the Commission. The comparison will be made the basis of reduced express rates to be ordered by the Commission. After considering the statement the Commission will issue a final order prescribing rates to be charged by all interstate express companies. The probability is that order will become effective early next spring.

A prominent official of one of the leading express companies in discussing this order of the Commission expressed confidence that the companies would be able to show clearly that any general reduction in their rates would inevitably result in disaster for them, and that for this reason no drastic action might be expected on the part of the Commission.

Express men base their confidence in the outcome on the public service which the companies perform and which was admitted by the Commission in its report. Even with the institution of the parcels post these companies will still carry about 80 per cent of the package freight of the United States. Approximately 90 per cent of their business, it is stated, is "merchant to merchant" business. Quick delivery is nearly always an essential feature, and it is claimed that such service as is performed by the express companies could not be given as satisfactorily by any other class of carrier.

As proof of the reasonableness of the rates now prevailing for express carriage, the fact that the companies show a net profit of only about six per cent on their actual turnover is pointed to.

RULING ON WIRELESS MESSAGES.

The Commission has ruled that under the act making telegraph and telephone companies common carriers, it has jurisdiction over wireless messages from a commercial station in the United States to a ship at sea, whether a United States or a foreign ship, but that it has no jurisdictions over messages between two American ships at sea.

The effect of the ruling is that the Commission may determine, in the event of complaint, whether charges are reasonable.

ENDORSE COMMERCE COURT.

Efforts will be made before the Senate Committee on Appropriations to secure needed appropriations to continue the Commerce Court in existence. The committee has agreed to hold hearings on the subject and members of the Commission will appear in behalf of the court.

RATE SUSPENSIONS.

The following rate suspensions were made public during December:

Distance Tariff.

The Commission has suspended from December 14 until April 12 Chicago and North-Western Railway tariff which provides for elimination of continuous distance tariff rates to and from points on the narrow gauge line of the Chicago and North-Western Railway in South Dakota. This elimination would result in application to points on the narrow gauge line combination of intermediate rates which exceed the present rates by various amounts.

Digitized by Google

Meats and Packing House Products.

The Commission has further suspended from December 13 until June 13 certain Santa Fe tariffs which advance rates on fresh meats and packing house products from Oklahoma City and other points in New Mexico. These schedules were originally suspended from August 15 until December 13.

Furniture.

The Commission has suspended from December 15 until March 31, a tariff of the Norfolk and Western Railway, which proposes to advance rates for the transportation of chairs from Madison, N. C., and other points to Boston, New York Philadelphia and Baltimore. The present rates on chairs in less than carloads from Madison to New York and Boston are 49 and 53 cents per 100 pounds, respectively; the proposed rates 55 cents to each point, making an advance of two cents to Boston and six cents to New York.

The Commission has suspended, until March 31, Southern Railway tariff which proposed advance in rates on furniture from points in the Carolinas and Virginia, to Boston, New York, Philadelphia, Baltimore, and other points.

Oil Cake, Etc.

In a supplemental order, the Commission has suspended from January 1, until March 31, Hosmers Tariff, which eliminates via the Missouri Pacific Railway and its connections, an existing export rate of 16½ cents per 100 pounds on oil cake, oil meal, screenings and flax seed, in carloads from St. Paul and Minneapolis to certain Gulf ports, including Galveston, leaving in effect only the class rate of 35 cents per 100 pounds.

Cottonseed.

The Commission has suspended from December 7 until April 5 a tariff of the Missouri Pacific Railway, which provides for cancellation of existing joint rates on cottonseed from points in Oklahoma on the Missouri, Oklahoma and Gulf Railroad to Little Rock and other points in Arkansas. The cancellation of present joint rates and substitution of combination rates will result in advances ranging from three cents to 13 cents per 100 pounds.

The Commission has suspended from December 24 to June 24 proposed advances in rates on shipments of cotton linters from points in Texas to New Orleans.

Grain.

Proposed advances in rates on grain for export shipped over the Illinois Central, Kansas City Southern and Missouri Pacific railroads from Kansas City, Mo.; Omaha, Neb., and other points in Central Freight Association freight territory to New Orleans, Galveston and other Gulf ports, have been suspended by the Commission until March 31, next. The advance amounts to three cents per hundred pounds.

Missouri Pacific, Illinois Central and Kansas City Southern had intended to discontinue reduced export grain rates to Gulf ports and had filed notices to that effect at Washington which would have automatically restored previous tariffs until the next season of navigation opened, but an order has been issued by the Commission to extend their reduced rates until March 31.

Advances of two cents per 100 pounds on wheat and coarse grain from Kansas City, and other Missouri River points to Southern Illinois, proposed by the Chicago and Alton, Burlington, Rock Island, Missouri Pacific and Wabash railroads, have been suspended by the Commission until April 14. An inquiry has been ordered.

The Commission has issued an order suspending from December 26 to April 25 next proposed advances in rates on shipments of grain from points in Southern Illinois to Texas points. The railroads propose an advance of about seven cents per 100 pounds.

Pig Iron.

The Commission has issued an order suspending from December 30 until June 30, proposed advances in the transportation rates of pig iron from Buena Vista and other Virginia points to Philadelphia and certain other Eastern destinations.

Coal.

Freight tariffs of the Grand Trunk and other railroads, containing rules and regulations governing division reconsignments and other privileges on coal, coke, iron ore and other commodities handled at Detroit, have been further suspended by the Commission from December 13 to June 13.

The Commission has suspended from December 15 until April 14 freight tariffs which propose to advance the charges for switching coal and coke at Chicago from connecting carriers to industries and coal yards on the tracks of the Chicago, Milwaukee and St. Paul Railroad within the Chicago switching districts by amounts ranging from six to twelve cents per ton. These tariffs had been filed by the Baltimore and Ohio; Chesapeake and Ohio; Chicago and Alton; Chicago and Eastern Illinois; St. Louis and San Francisco; Chicago, Burlington and Quincy; Chicago, Indiana and Southern; Chicago, Terre Haute and Southern; Cleveland, Cincinnati, Chicago and St. Louis; Erie; Grand Trunk; Illinois Central; Lake Shore and Michigan Southern; Michigan Central; New York, Chicago and St. Louis; Pennsylvania; Pittsburg, Cincinnati, Chicago and St. Louis, and the Wabash railroads.

Railway Equipment.

The Commission has suspended from December 6 until April 4, a Countiss Transcontinental Freight Bureau tariff on "railway equipment, new or second-hand, when handled as freight," which advances from $90 to $163.50 per car the rate for the transportation of empty freight cars to Cali-

Digitized by Google

fornia terminals from group F, which includes certain points in Illinois, Indiana, Michigan, Iowa, Kansas, Minnesota, Missouri, Nebraska and Wisconsin.

LUMBER.

Advances in freight rates on lumber from Lockhart and Samson, Ala., and other points to Washington, D. C., Baltimore, Md., and other destinations have been further suspended by the Commission from December 17 until June 17. These tariffs, filed by E. H. Hinton, agent, were first suspended from August 19.

Advances in rates on hardwood lumber and articles taking the same rates from points in Arkansas, Louisiana and other States to Memphis, St. Louis and other points of destination have been further suspended by the Commission from December 15 until March 15. The advances, which amount to about two cents per 100 pounds, were filed by M. P. Washburn, agent, and the Missouri Pacific and other railroads.

An order has been entered by the Commission suspending from December 10 until April 9 tariffs filed by R. H. Countiss, agent, which cancels joint rates on lumber from points on the Washington Western Railway to places on or reached by the Great Northern, the Northern Pacific and the Chicago, Burlington and Quincy railroads. The Washington Western is a line about 11 miles long in the western part of the State of Washington. Lumber shipped from points on that line to Eastern destinations now takes the so-called coast rates and the cancellation of joint charges with this line would cause shippers there to pay four cents and four and one-half cents per 100 pounds in excess of the coast rates.

DECISIONS RENDERED.

The following decisions were made public during December:

GRAIN.

Advances in rates on grain from Kansas City, Omaha, Council Bluffs, Iowa, and other points to New Orleans, and other Gulf points, for export, will be permitted to take effect December 23, according to a notice issued by the Commission.

These rates had been filed by the Illinois Central; Kansas City Southern; Texarkana and Fort Smith; Missouri Pacific; St. Louis, Iron Mountain and Southern and connecting railroads, but were suspended by the Commission. The Commission announces that for good reason this suspension order will be vacated.

A decision has been issued by the Commission in the Detroit reconsigning case, wherein it is held that the proposed charge of $2 for reconsigning carload shipments received at Detroit to points within the switching district is unreasonable unless the consignees are advised of the arrival of the cars at Toledo on the tracks of the carriers making delivery at Detroit, so that the consignees may have an opportunity to give their reconsigning orders before the cars reach the latter point.

About two years ago the carriers did not charge for reconsigning, but the business at Detroit grew so that in 1910 a tariff was filed fixing a reconsigning charge of $3, which was reduced by order of the Commission to $2. This charge was assessed only on shipments consigned to points beyond Detroit. The case in hand proposes a similar charge on reconsignment to points within Detroit switching limits. Coal comprises the largest traffic which is reconsigned at that point.

Announcing a decision in the case of P. C. Kamm and Company, against the Pennsylvania and other railroads, the Commission holds that the Milwaukee company, which owns a grain elevator in Milwaukee, receives double pay for the elevation of grain in that city, which is unjust, and that the tariffs of the railroads should be so modified as to provide that when that company collects this transfer charge from the Eastern lines, no transfer charge shall be made against the grain dealer. It was shown in this case that the Milwaukee company receives one-fourth cent per bushel for elevating grain if ordered out in ten days, and that the lines east of Milwaukee pay a charge to the owner or operator of the elevator in the same sum for the transfer service.

A readjustment of the rates on grain and flaxseed and of the differentials on those commodities among the cities of Minneapolis, Milwaukee, Duluth, Superior and other highly competitive points in the Northwest has been ordered by the Commission. It is designed to meet protests by various cities that the original orders of the Commission were not complied with, through lack of detailed directions.

CLASS RATES.

A decision has been handed down by the Commission vacating the suspension order issued against the advance in class rates by railroads operating between certain points in Iowa and Minneapolis and other places. It was found that the new rates would merely restore a traffic condition existing some time ago, against which there was no objection.

Class rates from Baker City, Oregon, to points on the Oregon Short Line between Olds Ferry, Idaho, and Vale, Ore., have been found to be unreasonable by the Commission upon complaint of the Baker Commercial Club against the Oregon-Washington Railroad and Navigation Company and others.

Class rates on motorcycles in less than carloads over the Atchison, Topeka and Santa Fe Railroad from points in Massachusetts and Ohio to Kansas City, Mo., and Ottawa, Kan., have been declared unreasonable by the Commission.

TUBS.

Announcing a decision in the case of the Cahill Iron Works, of Chattanooga, Tenn., against the Southern and other railroads, the Commission holds that the rate of $2.20 per 100 pounds on cast-iron, porcelain-lined, combination sink-and-laundry tubs from Chattanooga to San Francisco, when shipped in mixed carloads with sinks, is unreasonable. The rate of $1.40 was ordered to be put in effect by January 15.

Digitized by Google

Fruit.

In the case of M. W. Thompson against the Atchison and other railroads the Commission holds that the charges on apples from Espanola, N. M., to various points in Arizona and California based upon a combination of local rates were unreasonable in so far as they exceeded a joint rate of 80 cents.

The Commission has rendered a decision which holds unreasonable existing rates on fruits and vegetables from Louisiana and Texas points; on apples and other deciduous fruits from Oregon, Utah and Idaho; and on citrus and deciduous fruits, canned goods and vegetables from California points to Crawford, Neb., and other Middle Western destinations. The Commission ordered a general reduction of the rates, averaging approximately 20 per cent; the reduced rates to remain in effect for at least two years from February 1, next.

Oil.

The Commission has ordered the withdrawal of tariffs proposing advances in rates for the shipment of petroleum and its products from refineries in the so-called Buffalo group to points in Southern Ohio and Indiana. The Terminal Railroad Association of St. Louis, St. Louis Merchants' Bridge Terminal Railway, Wiggins Ferry Company and the Interstate Transfer Company were among the defendants in this proceeding. All points of destination involved are not confined to Ohio and Indiana, but are in what is known as Central Freight Association territory.

The Commission says: "The railroads' only justification for the proposed increases was the history of the class rate adjustment and the contention that as oil had theretofore taken 90 per cent of the fifth class rate it should continue to take the same percentage of the increased fifth class rate. No attempt was made to determine the reasonableness of the oil rate either before or after the proposed advance, and, while there might have been reasons justifying the increases in the class rates, it is not shown that any of these considerations necessarily relate to the oil rates.

"We are of the opinion that the proposed rates would work an unjust discrimination against the points at which the increases are contemplated in favor of points at which no increases are sought to be made."

Furniture.

In a formal order the Commission has set aside two former orders suspending proposed advances in rates on shipments of furniture from St. Louis to Texas common points. The advance from St. Louis to Texas common points is six cents per 100 pounds, or from 79 to 86 cents, and will become effective December 24. The new tariff carries corresponding increases to other Texas points.

The territory of origin involved in the order lies west of Atlantic seaboard territory and east of Colorado common points. Furniture manufacturers in all parts of the territory involved protested against the advance. They agreed that no question of relative rates is involved, that if the advance from St. Louis is proper all the other advances necessarily and properly follow. For this reason the Commission passed only on the question of the advance from St. Louis, which is upheld.

Wool.

Wool shipments are the subject of a supplementary opinion by the Commission dealing with unreasonable rates and practices of transcontinental lines in its transportation.

A minimum carload weight of 24,000 pounds prescribed by the Commission imposes no unreasonable burden on the shipper but actually increases the car efficiency and economy of transportation, it is held. The contention of shippers that baled and sacked wool take the same rate is not sustained. Rates on scoured wool from New Mexico to Eastern destinations are declared to be excessive and should be reduced, and wool in Western territory should take the fourth class.

This decision disposes of cases instituted by the Railroad Commission of Oregon and the National Wool Growers' Association, which have been pending for several years.

Cotton.

A decision has been issued by the Commission on the complaint of the Galveston Commercial Association and others involving the export rates on cotton. The decision points out that the Commission has no direct authority to require the issuing of a through export bill of lading, since it had no jurisdiction over the water carrier, but this must not be understood as meaning that the Commission may not act upon the rail carrier which is subject to its jurisdiction in a proper case where the ocean carrier stands ready to enter into these through arrangements upon reasonable terms. The Commission ordered the Atchison, Topeka and Santa Fe and other roads to apply the same treatment to cotton for export at Galveston as to New Orleans and the Texas ports.

Iron.

The Commission has decided in the case of the Wharton Steel Company and B. Nicoll and Company versus the Delaware, Lackawanna and Western Railroad that rates on iron ore from points in northern New Jersey and southeastern New York to furnaces in the Lehigh and Schuylkill Valley districts of eastern Pennsylvania and from Keenes, N. Y., to Wharton, Pa., are reasonable. It is suggested, however, that certain readjustments should be made in tariffs to remove inconsistencies.

Coal.

Chesapeake and Ohio and other carriers in Central Freight Association territory have been directed by the Commission to make reductions in rates on channel coal from Redwine, Ky., to northwestern Ohio, Indiana, Wisconsin, Illinois, Missouri and Michigan, beginning February 1. The present rates from Redwine are anywhere from 40 cents to $1.15 per ton more than from the Kanawha district to Kentucky, and the Commission says they must in no case exceed 40 cents excess.

In deciding the matter of alleged irregularities in mine ratings among the coal mines served by

Digitized by Google

the Illinois Central Railroad Company, the Commission holds that the ratings of the mines shall be based upon their several hourly capacities for production; that the mines that have outlet by river shall be treated as junction point mines; that upon days for which the junction point mine orders no cars from another carrier, it shall have its full rating on the Illinois Central; that upon a day for which it orders cars from one other carrier, its rating on the Illinois Central for that day shall be 75 per cent of its full rating; and that upon a day for which it orders cars from two other carriers, its rating on the Illinois Central for that day shall be 50 per cent of its full rating.

LUMBER.

The Commission has dismissed the complaint of the Appalachia Lumber Company and others against the Louisville and Nashville and other railroads wherein it was alleged that the lumber rates from points on the Cumberland Valley division of the Louisville and Nashville Railroad to certain points in Ohio, Michigan and Pennsylvania are unreasonable. The Commission holds, however, that "the claim that defendants make lower lumber rates from points on the Cumberland Valley division to more distant points than to intermediate points north of the Ohio River is not passed on, pending fourth section applications of interested carriers for relief from the operation of the long-and-short haul clause.

"No reparation can be awarded up to the time when the Commission passes upon these fourth-section applications, unless, possibly, a case is made out under the third section, which might carry with it an award of damages, or unless under the first section the rate to the intermediate points has been found unreasonable."

The contention of the Multonomah Lumber and Box Company and others of Portland and Astoria, Ore., that rates on box lumber from these points to places in California as compared with the rates given Glendale and Cottage Grove, Ore., are discriminatory and unjust, has been sustained by the Commission. The defendants were the Southern Pacific Railroad Company and the Spokane, Portland and Seattle Railway Company.

PERSONALS.

EXECUTIVE

F. B. Bronder has been appointed receiver of the Chicago, Fox Lake & Lake Geneva R. R. and of the Wisconsin Construction Company.

A. C. Clark has been elected vice-president and general manager of the Southwestern Railway, with offices at Henrietta, Texas.

Wilbur Coman has been appointed vice-president and manager of the Northwestern Electric Company.

Newman Erb has been elected president of the Ann Arbor, succeeding Joseph Ramsey, Jr., resigned.

J. M. Fitzgerald has been elected president of the Western Maryland Railway, with headquarters at Baltimore, Md.

R. B. Fowler has been elected president and general manager of the Tremont & Gulf, with headquarters at Winnfield, La., to succeed W. H. Seaman, resigned.

G. B. Hengen has been elected president of the Oregon, Pacific and Eastern Railway, with office at Chicago, **A. B. Wood,** first vice-president, and **Jesse Darling,** secretary with headquarters at Cottage Grove, Oregon.

W. S. McChesney, Jr., has been elected president of the Wiggins' Ferry Company, with office at St. Louis, Mo.

Elisha Lee has been elected chairman of the Railway Managers' Committee.

Ivy L. Lee has returned to the service of the Pennsylvania Railroad. He has been made assistant to President Rea.

J. C. Stuart of the Erie resigned as chairman of the Conference Committee of General Managers of Eastern Railroads.

Dr. F. J. Will announced his retirement from the services of the Northwestern as district surgeon.

OBITUARY.

Thomas W. Galleher, general freight agent of the Baltimore and Ohio Railroad lines east of Pittsburgh, died on the morning of December 18th, at Baltimore, Md. He had been in the employ of the Baltimore and Ohio for 30 years. He was 54 years old.

Mr. Galleher entered the service of the railroad in 1872 as a telegraph operator. Two years later he was transferred to Butler, Ohio, and the next year went to the division freight agent's office in Columbus, Ohio. In 1880 he became agent of the Baltimore and Ohio express at Columbus, and in 1882 was advanced to traveling freight agent, with headquarters in that city.

Having come to Pittsburgh as chief clerk to the general freight agent, Mr. Galleher was made division freight agent in 1887. On August 16, 1896, he was promoted to be general freight agent of the Pittsburgh district and in March, 1897, was transferred to Baltimore as general freight agent of the Eastern lines.

Alexander G. Hackstaff, vice-president of the Illinois Central and a director of that company, died on November 28th, at his home in New York. He was born on May 16, 1852, at Middletown, Conn., and began railway work in 1871 as a civil engineer on the Pennsylvania Railroad. He went to the Illinois Central in 1880 as a clerk in the president's office at Chicago. In May, 1887, he was appointed acting secretary of the same road, and on March 19, 1888, was made secretary. He was elected third vice-president of the Illinois Central in 1901. He was also a director of the Central of Georgia and of the United States Express Company.

F. H. Bainbridge, formerly principal assistant engineer of the Chicago & Northwestern, with headquarters at Chicago, and later resident engineer, died at Chicago, December 3d, at the age of 49 years.

John S. B. Thompson, of Atlanta, Ga., for years prominent in the supervising of the Southern Railway, died at Richmond, Va., on December 11th. Mr. Thompson was a native of Culpeper County, Virginia, and was born June 10, 1858. In July, 1878, he began his railroad career with the Virginia Midland Railroad, afterward going with the Long Island Railroad, and then holding responsible positions with branch roads under the supervision of the Southern Railway, of which for a number of years he was assistant to the president.

Col. S. C. Reynolds, of Toledo, for many years a director of the Wabash Company, president of the First National Bank of Toledo and prominent in Ohio business affairs, is dead.

Joseph Davenport, 97 years old, inventor of the locomotive cab and pilot, and builder of the first wrought iron bridge in the United States, died recently at Zoar, the socialist settlement near Massilon, Ohio, where he had been a recluse for years.

TRAFFIC AND RATES.

Heavy Traffic Movements for December.—The closing months of the old year witnessed a volume of tonnage which equalled, if it did not exceed any record for a corresponding period of previous years. While the car situation improved somewhat during December, the traffic movements continued heavy. Grain shipments were unusually large and the holiday trade called for facilities which taxed the carriers to the utmost. The car situation has become an all important factor, and the pressure under which the railroads have been laboring is evidenced by the acceleration in new equipment orders during the past three months. As an illustration of the freight congestion, it is of interest to note that on December 14th, there were several miles of freighters laden with grain lying within the breakwater of the outer harbor of Buffalo. This grain will be transshipped at the rate of 500 to 1,000 carloads a day during the winter months, and a large part of the remainder is likely to be shipped by canal in the spring. In fact the grain movement both at interior points and all along the lake front has been of an unprecedented volume, and is calling for thousands of cars with which to handle it. The iron ore and coal shipments down the lakes have also been heavy, the former totalling nearly 48,000,000 tons for the year and establishing a new high record. In the annual report on lake commerce coming from the canal office at the Soo Locks, is found the statement that the increased tonnage during 1912 amounted to 15,000,000 tons of registered freight and nearly 20,000,000 tons of unregistered freight. This is indicative of conditions which have had to be met in other sections of the country.

Export and import figures further strengthen the belief that the country is engaged in a record making commerce. An estimate recently prepared and published by the United States Government, asserts that the foreign trade of the United States in 1912 crossed the $4,000,000,000 line. Its highest former record was approximately $3,500,000,000 in 1911, and it only crossed the $3,000,000,000 for the first time in 1906. This gives some faint indication of the tremendous industrial and commercial strides made within the past seven years. Imports have practically doubled in value since 1901 and exports have practically doubled since 1904. It is also asserted, through the same source, that the world's international commerce has established a new high record in 1912, present indications being that the total will aggregate $35,000,000,000 against $31,000,000,000 in 1910 and $20,000,000,000 in 1900.

Heavy Increases in Ocean Freight.—Heavy increases in freight and passenger offerings between San Francisco and the Philippine Islands have caused the Pacific Mail Steamship Company and the Toyo Kisen Kaisha to double their schedules of direct trips to the Philippines. Of out-bound freight, cotton is said to be the principal factor in the increase. Larger quantities of hemp and other island products are coming this way.

On the Atlantic Coast all ships are carrying capacity cargoes and many of the regular lines have found themselves unable to handle all the freight offered and have been forced, when possible, to charter extra steamers. Generally, however, they have found that no vessels were available and that the price of charters have doubled in two years.

Extra Fare Reduction on Lake Shore.—Slower time between New York and Chicago by the Lake Shore Limited via the New York Central has reduced the extra fare to $2 instead of $3.

Change in Excess Baggage Rates.—Beginning January 1st, excess baggage rates on all lines operating eastward from Chicago will be based on the fare applicable via the route of the ticket. This will give passengers on differential lines the benefit of a lower charge for excess baggage.

Passes Cancelled in Colorado.—The railroads of Colorado have decided to cancel all free transportation in that State, outside of that given to railroad employees. Heretofore, it has been their custom on intrastate business to distribute free transportation to many public officials and often to prominent shippers.

Heavy Travel to the Pacific Coast.—Passenger traffic officials of railroads operating westward from Chicago report that there is an unusually heavy winter tourist travel to California. Extra coaches are being attached to through California trains almost daily.

Passenger travel to points in Florida is also reported to be greater in volume than at this time last year.

Reduced Fares for Presidential Inauguration.—Reduced fares for the inauguration ceremonies in Washington, March 4th next, have been announced by the eastern railroads. From points more than 100 miles and not more than 250 miles from the National Capital the fare will be two cents a mile in each direction, and from points more than 250 miles from Washington the rate will be on the basis of a one and one-half fare for the round trip.

New Grain Tariff Announced by Grand Trunk.—With less than half of the grain crop of Western Canada moved at the close of navigation, the Grand Trunk Pacific Railway Company announces a new tariff by which all grain accumulated on its lines will be shipped through the United States to Portland, Me., Boston and New York. The new tariff allows milling in transit.

A similar tariff, it is stated, has been made by the Canadian Northern, and it is estimated that nearly 75,000,000 bushels of Canadian grain will pass through the United States during the winter.

Losses in Transit.—The Pere Marquette Railroad has issued an appeal to its employes in which it points out that the loss and damage claims against the company have assumed alarming proportions and that the reputation of the railroad as a reliable freight carrier is suffering. Pere Marquette paid during the last fiscal year on account of lost and damaged freight a total of $178,997.71.

Digitized by Google

Record of Pennsylvania Railroad's New York Station.—It is officially reported that more than 21,000,000 passengers used the Pennsylvania station in New York in the first two years of its operation. By increasing the efficiency of operation, the Pennsylvania and Long Island railroads were able to handle in the year just ending 2,241,050 more passengers than in 1911, while running about 10,000 less trains.

Action on Summer Tourist Rates.—At a meeting of the Trans-continental Passenger Association held in Chicago last month, summer tourist fares to the Pacific Coast during 1913 were placed upon the same basis as prevailed last year. The round-trip first-class summer tourist fare from Chicago will be $72.50. Tickets will be on sale from June 1st to September 30th, and the return limit will be October 31st. Convention rates to the Pacific Coast also will be the same as those prevailing during the past year. The round-trip fare from Chicago will be $65, with a return limit of sixty days. A year ago convention fares were increased from $62.50 to $65.

Action on the question of adopting a plan whereby the cost of operating through trains can be reduced was deferred until the next meeting of the association.

Railroad lines entering California, Arizona and Nevada, have announced one-way colonist rates to points in those States for the spring of 1913. The sale dates will be March 15th to April 15th. From Omaha and Kansas City the rates will be $30; from Chicago, $38, and from St. Louis and New Orleans, $37.

LEGISLATION.

Oregon's Workingmen's Compensation Bill.—Important among the bills to be considered at the coming session of the Oregon Legislature is a workingmen's compensation act that has been drafted by a special commission, appointed by the Governor, representing the State Grange, organized labor and the employers. The measure is a composite of what the commission regarded as the salient features of similar statutes of a number of other States.

In the first place, the proposed law provides for an elective compensation plan. It is not compulsory on any employer to avail himself of its conditions. As drafted the measure covers only the most dangerous forms of employment, although employers conducting less hazardous operations may, with the consent of their employes, operate under its provisions. The employer who elects not to operate under the terms of the law, however, will be held liable for negligence and will lose the benefit of the common law defenses of contributory negligence, negligence of fellow servants and assumption of risk.

The bill provides for an industrial commission of three members, who shall investigate all cases coming under the operation of the measure and whose findings of facts shall be final. It will be the function of the commission to determine the allowance to be made to injured persons.

New York Bill Covering Railway Track Scales.—A bill has been prepared by the State Superintendent of Weights and Measures of New York, which has for its purpose the maintenance of a uniform accuracy of railroad track scales through the State. The bill which will be presented to the next Legislature proposes that the State purchase several test cars, whose weight shall be indisputably determined by State standards, and by means of these, establish a scale inspection service.

Superintendent Reichmann believes such service could be made self-supporting by charging for the tests and that the plan advocated would eliminate disputes and lawsuits due to weighing, and would assist railroads in locating where shortages occur.

Bill to Relieve Car Shortage.—Congressman Prouty, of Iowa, has introduced a bill in the National House of Representatives, which has for its object the alleviation of conditions brought about by car shortages. The gist of the measure is that railroad companies shall require consignees to unload their freight in five days, demurrage or no demurrage, and that if the railroad company does not enforce this right, it shall be liable in damages to the person ordering cars and not receiving them.

Mr. Prouty says 50,000 coal cars in sea coast cities are tied up, loaded with coal, the consignees preferring to pay demurrage and use them for warehouse purposes. He will follow this bill with one requiring the Interstate Commerce Commission to investigate the rolling stock of roads, and if it is inadequate compel the roads to make it adequate.

Railroad Valuation Bill.—The Adamson bill for the physical valuation of railroads which passed the National House of Representatives last month, and which is discussed more fully in another section of this issue, imposes a three-year task on the Interstate Commerce Commission, which, it is estimated, will cost about $3,000,000. The bill directs the Interstate Commerce Commission to engage the necessary number of experts to make a thorough inventory of the property of all railroads engaged in interstate commerce. It is provided that the investigation shall embrace the rolling stock and bond issues and all assets and liabilities of common carriers. The report accompanying the bill declares that the anomaly has grown up in the country whereby railroads charge on what they owe as well as on what they own and that nowhere else does this condition exist.

Agitation for State Ownership of Railroad in New England.—Following a movement in Massachusetts, where bills have been filed in the Legislature proposing the purchase of the Boston & Maine Railroad by the State, Representative Lewis W. Brewster has prepared a bill of similar import to be acted upon by the New Hampshire Legislature.

Mr. Brewster proposes that New Hampshire acquire such portions of the Boston & Maine system as lie within the State.

LEGAL.

Railroads Liable for Registered Mail.—Judge Marshall, in the United States District Court, at Salt Lake City, has overruled the demurrer of the Union Pacific against the complaint of the Government asking $12,000 damages for postal losses in a disaster at Ah Say, Wyoming, seven years ago.

Oregon's Rate Bill Suspended.—Oregon's first initiative rate bill was temporarily suspended in December at Portland, Oregon, by the Federal Court, three judges sitting in the case. Pending a final hearing of the issue raised by the railways, as to whether the bill is practicable and constitutional, the Court held that the railways should file bonds aggregating $55,000.

Illinois Tax Decision.—The Illinois Supreme Court sustains the Illinois Tax Reform League's contention that stocks held in foreign corporations are taxable and orders the Board of Review to hear and review the Reform League's complaints. Nearly $200,000,000 worth of securities are involved and should ownership of the securities be proven the taxes, covering a period of several years, would aggregate nearly $5,000,000.

To Test Norris Act.—It is reported that a decision has been reached by the management of the Union Pacific Railroad to test the constitutionality of the Norris act, passed by the last Congress, which limits the width of the right of way or the Union Pacific to 200 feet. It is contended by the railroad that a 400-foot right of way between Omaha and Ogden and Kansas City and Cheyenne was granted it by the government when the road was chartered.

Rules Against Louisville and Nashville.—Judge Evans, in the Federal Court at Louisville, has rendered decision to the effect that the Louisville and Nashville Railroad had no right to force the Western Union Telegraph Company to remove immediately its equipment from the Louisville and Nashville tracks in the State of Kentucky. A contract between the railroad and the telegraph company expired last August and the railroad ordered the Western Union to remove its equipment, but the telegraph company sued for a right of way. Judge Evans also held that the matter of compensation for a right of way should be left to a jury. The decision was based on an act of the Kentucky Legislature, which gives a telegraph or telephone company the privilege of condemning a right of way along the road of a common carrier.

Florida East Coast Railway Rate Problem.—The financial wisdom of the mighty engineering feat that extended the Florida East Coast Railway over the Keys to Key West, Fla., is a problem laid before the Supreme Court of the United States. It arises out of a prolonged contest over freight rates on Florida citrus fruits and vegetables.

It has been estimated that it cost $40,000 a mile to build the railroad north from Homestead, but four times that amount to construct it south over the Keys.

The Interstate Commerce Commission held that the company was not entitled to charge freight rates which would yield remuneration upon this high expenditure. The commerce court upheld the decision. To procure a reversal of these holdings the case has been brought to the Supreme Court of the United States.

Illinois Charter Fee Paid Under Protest.—The Chicago, Burlington & Quincy has paid into the Illinois State Treasury under protest, a check for $110,885 as a fee for an extension for fifty years of the road's charter in that State. Attorneys for the railroad contend the road is operating under a perpetual charter, but to be on the safe side they decided to take advantage of the recent act of the legislature allowing corporations the right to extend their charters fifty years.

The law in question is silent on the subject of fees in connection with such extensions, but the Secretary of State held they must be paid. Attorneys for the railroad have given notice that action will be instituted in the Supreme Court to recover the fee.

Commission Upheld in Stock Yards' Case.—The Supreme Court of the United States has decided that the Chicago Junction Railways Co. is subject to the control of the Interstate Commerce Commission and also that the Union Stock Yards Co., of Chicago, is a common carrier. The effect of the decision is to place both the Stock Yards Company and the Junction Railways under the supervision of the Interstate Commerce Commission. The court reversed the Commerce Court's decision as to the Stock Yards Company and affirmed it regarding the Junction Railways.

The suits were brought to restrain the two companies from further engaging in interstate c mmerce until they filed tariffs as required by the Interstate Commerce Act.

A side-light of the case was a ruling that the offer of a bonus to a packing company to locate near the Stock Yards was illegal.

Liability Act Tested.—The federal employers liability act was tested in New York County courts for the first time last month when a jury in the supreme court decided that under its provisions Terrence Burtnett was entitled to $10,000 from the Erie Railroad because he lost a foot while serving as brakeman in the interstate service of this line.

Justice Delany, who presided, described the case to the jury as one of unusual importance to railroad corporations. Counsel for the brakeman declared that Burtnett was thrown from the top of a freight car when the engineer applied the air brakes too violently. The railroad attorneys asserted that the accident was due to the icy condition of the car roof and Burtnett's negligence.

Under the federal act the plaintiff's council contended that the brakeman was entitled to recover, even if he was guilty of contributory negligence, but in that event the damage should be reduced to the extent to which the jury found the brakeman's negligence contributed to the result. Justice Delany took the view contended by the attorney and so charged the jury.

Jim Crow Decision in Mississippi.—Under a decision of the Mississippi Supreme Court handed down by Justice Cook in the case of the Alabama and Vicksburg Railroad Company vs. Miss Pearl Morris, the interstate as well as intrastate roads may be required to maintain double Pullman service as well as separate coaches for the two races. The question as to interstate passenger service has never gone to the United States Supreme Court, but the interstate law has been upheld by that tribunal in a case sent up from that State.

In the present case Miss Morris, a white woman, demanded that negroes be ejected from the sleeper after the train crossed the Mississippi River at Vicksburg, but the conductor declined, stating his negro passengers were interstate passengers. Miss Morris left the Pullman and sat up all night in the coach. She afterward entered suit in the Warren County Circuit Court and was promptly given a verdict for $15,000. The railroad appealed and got a remittur of $2,000, the damages being declared out of reason, but otherwise the verdict is affirmed. It will be appealed to Washington.

Oklahoma Supreme Court Sustains Rate Order.—The Oklahoma Supreme Court has sustained the last of the freight rate orders promulgated by the Corporation Commission in 1911 to succeed those rates enjoined by the Federal Court. The rates applied on coal and coke, lumber and forest products, grain and hay, oil and by-products and street and building materials.

Under writs of supersedeas the rates were not put in force at the time of their promulgation in 1911, although refunds will be made to the shippers of sums paid in excess of the new schedules after July of that year. The old rates will be charged and refunds made later, until new tariffs can be printed embodying the schedules affirmed by the court.

As finally affirmed by the court, the rates vary slightly from the schedules as promulgated in 1911, under the terms of an agreement reached at a conference in St. Louis between the Commission and the officials of the various railroads. The carriers agreed at that time to accept slightly increased rates, and to make the refunds to shippers on that basis, without further opposition.

No mention of the conference was made to the Supreme Court, but the agreed rates were submitted to the court and recommended to be affirmed. The court accepted the recommendations in full.

Rutland Injunction Upset.—Through decision of the Appellate Division of the Supreme Court of New York, the order restraining the New York Central from selling its control of the Rutland to the New Haven Railroad was reversed. In the prevailing opinion Presiding Justice Ingraham declares that the suit apparently was brought in the interest of minority stockholders of the Rutland to compel the New Haven to purchase their stock at the same price paid the Central.

In 1911, the Central, which owns the controlling interest in the Rutland, agreed to sell the road to the New Haven at $105 a share, provided the latter would take up demand notes of the Rutland amounting to $873,000. In a suit brought by Tompkins C. Delavan and others who own 1349 Rutland shares, the sale was enjoined. Their complaint alleged that the transfer would effect a combination in violation of the Sherman law by destroying competition between the Rutland-New York Central and New Haven-Boston & Maine systems.

Justice Ingraham points out that the system of the New York Central is in fact a much greater competitor of the Rutland than is the New Haven, and says that if it would be illegal for the New Haven to obtain control of the Rutland, it would be a more serious violation of the Federal statute for the Central to continue in control. The effect of the injunction would be to restrain the Central from relieving itself of ownership, which is alleged to violate the law.

Fined $5,000 for Misdescribing Freight.—In our weekly issue of July 5, 1912, under the caption of "The Shippers' Evasion of the Interstate Commerce Law," we pointed out the extent to which the requirements of the law were defeated by shippers misdescribing their property and obtaining lower than the legal tariff rates, and directed attention to the comparatively few convictions that have been secured for this character of violations.

The Interstate Commerce Commission together with the Department of Justice, through the various United States District Attorneys, have evidently become more active with respect to these matters, and we note a recent instance where the firm of A.Mendelson's Sons, of Albany, N. Y., were indicted for misdescribing shipments of chloride of lime as concentrated lye. The amount of 81 cents would have been saved by the shippers had the goods been forwarded under the wrong description. The shippers plead guilty and were fined $5,000. This case is noteworthy in that the maximum fine was imposed for an attempt to obtain transportation at less than the regularly established rates.

STATE COMMISSIONS.

Arizona.—The State Corporation Commission has issued an order suspending the operation of the 3-cent fare law, on the affidavit of a railroad official that the rate would not be remunerative. The order will be effective pending an investigation. State and county officials already had been enjoined by the United States Court of Appeals from enforcing the law until a hearing is held on January 21st.

Canada.—The Dominion Railway Commission has issued an order granting the application of the Canadian Pacific Railway, Grand Trunk, Canadian Northern and Michigan Central railroads to increase their demurrage charges on freight cars from $1 per day to $2 and $3. The increased rates, however, will be allowed only from December 15th, 1912 to March 31st of 1913. The railways asked for $2, $3 and $4 for the first, second and third day, respectively, after the free time allowed, but the $4 charge was not sanctioned by the Board. Henceforth, $2 will be assessed by the railways for the first 24 hours after free time and $3 for each succeeding day. The order, however, is not to apply to cars held in transit at stop-over points under

Digitized by Google

published tariffs which have been filed with the Board.

Assistant Commissioner D'Arcy Scott, who heard the case, in his judgment said in part: "It cannot be denied that a car shortage equal to, if not greater than, that of last year is imminent; and, unless some steps are taken to secure an adequate supply of cars, traffic will be seriously handicapped during the approaching winter and spring, until the opening of navigation. It is urged by the railway companies that the unnecessary detention of cars by shippers and consignees not only handicaps the railway companies by depriving them of cars which would otherwise be available for traffic, but also causes congestion by blocking steam tracks and private sidings in terminals. It is contended that at least 50 per cent. of what is called railway detentions, that is, the unnecessary holding of cars in terminals by the railway companies, is due to the blocking of these terminals by the unnecessary detention of cars by shippers and consignees."

Railroads operating in Michigan applied to the Railroad Commission of that State a few weeks ago for permission to increase demurrage charges from $1 a day after forty-eight hours to $5 a day.

Connecticut.—Chief Engineer Elwell, of the Public Utilities Committee filed his report last month with the Commission on the inspection of track conditions on the New York, New Haven & Hartford Railroad between New York State line and New Haven. Summarizing conditions, the report says:

"The roadbed in general was found to be in excellent condition, well-ballasted and true as to line and grade. A number of defects were found and noted. None of these defects is of such extreme character as to be pronounced immediately unsafe or dangerous."

Then follows a description of each defect, and the recommendations for changes.

The inspection, ordered by the Commission, was made, according to the report, by three engineers working under Mr. Elwell's direction. Each tie and each foot of roadbed was inspected.

In obedience to the orders of the Public Utilities Commission, issued since their investigation of the Westport wreck on the New Haven, President Mellen has issued instructions that wherever practicable all cross-overs between parallel main tracks used for trains going in the same direction and through which trains are detoured, be supplied with No. 20 cross-over frogs.

All trains scheduled at fifteen miles or more an hour on straight tracks must stop before making cross-over movements. Towermen are not to set switches for such movements until such trains make a full stop. This installation of new frogs applies to the whole system wherever four tracks are used and it is directed that the work be done at once.

Illinois.—In a statement made before the State Railroad and Warehouse Commission, M. L. Bell, attorney for the Rock Island said that railroad employees who post notices on bulletin boards that trains will be on time when they know they will be late should be sent to jail.

Kentucky.—The Railroad Commission has made a tentative assessment of the physical property of the various railroad companies in the State based upon the valuation paid on by the companies in 1911, with the understanding that the commission shall make a more complete investigation at the earliest possible date and from the additional evidence obtained make a final assessment. The tentative assessment will be paid by the railroad companies as provided by law. The final assessment made by the commission will be subject to contest. It is likely that the assessment of several of the railroads will be increased many millions.

Louisiana.—The State Railroad Commission is considering the adoption of the following rule to govern the protection of trains stopped or delayed in transit:

RULE.

When a train stops or is delayed, under circumstances in which it may be overtaken by another train, the flagman must go back immediately with stop signals a sufficient distance to insure full protection. When recalled he may return to his train, first placing two torpedoes on the rail, when the conditions requite it. The front of a train must be protected in the same way when necessary by front brakeman. If the front brakeman is not available the fireman must act in his place.

(a)—The flagman shall immediately after he leaves his train, light a red fusee and carry it with him back one-quarter of a mile to the point where he places the first torpedo and must leave a burning fusee at the same point as the first torpedo.

A sufficient distance to insure full protection requires that the flagman shall go back to a point one-fourth of a mile from the rear of his train, where he must place one torpedo on the rail. He must then continue to go back at least one-half mile from the rear of his train and place two torpedoes on the rail, not more than two hundred feet apart; he may then return to within one-fourth mile from the rear of his train, and remain there until recalled. If a passenger train is due he must remain until it arrives. When he comes in he will remove the torpedo nearest to train, but the two torpedoes must be left on the rail as a caution signal to a following train.

The recall of flagman is the most critical period, and when there is not a clear view of at least one-half mile, train must be moved forward a sufficient distance to insure safety before flagman is recalled. During foggy or stormy weather, or in the vicinity of obscure curves or descending grades, or when other conditions require it, the flagman will increase the distance. When a train is flagged by a flagman engineman must obtain a thorough explanation of the cause, stopping if necessary.

(b)—Should the speed of a train be reduced and its rear thereby endangered, making it necessary to check a following train before a flagman can get off, a lighted red fusee must be thrown on the track at intervals to insure the safety of the leading train.

(c)—In block signal districts where automatic home block signal governing the track in use can be plainly seen at rear of the train to

Digitized by Google

be at stop, its location being not less than one-half mile from the train to be protected, it will be unnecessary for flagman to go back.

(d)—When a flagman is sent out with specific instructions affecting the rights of trains, such instructions must be in writing.

(e)—When a flagman is sent to a station on a train, he will ride on the engine and engineman must stop and let him off at the first switch.

Maryland.—The Public Service Commission has under consideration the extension of free time in unloading freight cars.

Officials of all the railroads centering in Baltimore attended a hearing yesterday before the Public Service Commission, at which the question of demurrage was taken up.

There has been some complaint that the period allowed receivers of freight to unload cars is not long enough. The railroads give them 48 hours, with certain allowances for bad weather. There is also a system of credits and debits in the cases of those whose freight receipts are large, by which if a man receives a number of cars of freight and unloads them in less than the time allowed he is given credit for the time allowance not used, and this is credited to him when he takes a longer time than is allowed with other cars.

This system has the sanction of the Interstate Commerce Commission. On the other hand, it is contended that since the size of freight cars has been so materially increased 48 hours is not sufficient for unloading, particularly in the country where farmers and others have to haul the stuff they unload several miles.

Michigan.—The Commission held the case under advisement. Chairman C. L. Glasgod of the State Railroad Commission has been notified that the Minneapolis, St. Paul & Sault Ste. Marie Railroad is willing to comply with the provisions of the Michigan law requiring all upper peninsula railroads to carry passengers for two cents per mile. The law was passed at the last regular sessions of the Legislature.

Minnesota.—In response to petitions to the Railroad Commission for an order abolishing switching charges by the Minneapolis Eastern, Minneapolis Western, Minnesota Transfer and the Railway Transfer, the Omaha and the St. Paul jointly deny that their lines include the Minnesota Eastern, or that that road is merely a switching facility for them.

The Great Northern admits control of practically all the stock of the Minneapolis Western but says the road is operated as a regular common carrier and has a published tariff covering all its business. Jurisdiction of the State Commission as to its interstate traffic is denied. Nine roads answer for the Minnesota Transfer on the same basis.

New York.—The Up-State Public Service Commission has granted the application of the Fitchburg Railroad Co., for authority to issue $400,000 20-year 4½ per cent. bonds, to be sold at par. The bonds are to be issued to the Boston & Maine Railroad, which has a lease with the Fitchburg, in payment for expenditures in the past year for various improvements along the line of the Fitchburg.

The Public Service Commission has granted an extension to the New York Central for the completion of its Grand Central Terminal improvements from January 1st next to January 1, 1914, which had previously been approved by the Board of Estimate. It developed at the hearing that the street traffic on Forty-third Street will be entirely restored by March 1, 1913 and the streets at Forty-fourth Street and Vanderbilt Avenue, will be in complete order by April 1, 1913. When that is accomplished the traffic at Forty-fifth Street, will be greatly relieved and in reply to a question by counsel to the commission the New York Central through its officials testified that the street obstruction would be entirely relieved and all the improvements completed by or before December 31, 1913.

Application has been made to the Public Service Commission by the New York Central & Hudson River Railroad and the Lake Shore & Michigan Southern Railway companies for the approval of New York Central lines equipment trust agreement of 1913 and the authorization of the present issue of $12,547,000 of trust certificates thereunder. The petitioners ask that the certificates be allowed at not less than 97.

The proceeds are to be used for the purchase of equipment, including locomotives, coaches and cars.

Ohio.—Application has been made by the Lake Shore & Michigan Southern, the Cleveland, Cincinnati, Chicago & St. Louis, the Toledo & Ohio Central, and the Pittsburgh & Lake Erie roads, as subsidiaries of the New York Central, for the issue of certificates aggregating $24,000,000 to cover purchase of new equipment. Of the total amount sought, $13,941,474 is needed immediately, and the remainder is required to cover later demands.

The Public Service Commission has authorized the Cleveland, Cincinnati, Chicago and St. Louis Railway Company to issue its General Mortgage Bonds of the par value of $1,578,000 to be sold for the best price obtainable and for not less than ninety (90) per centum of the par value thereof.

The Public Service Commission has authorized the Cleveland & Pittsburgh Railroad Company to issue, transfer and deliver to the Pennsylvania Railroad Company, its special guaranteed four per cent. stock of the par value of $2,019,100, it being the opinion and finding of the Commission that the issue of said stock is reasonably required for the proper purposes of said corporation.

The stock is to be issued to the Pennsylvania Railroad in full payment and discharge of the obligation created in the construction and provision of improvements and additions to the Cleveland and Pittsburgh Railroad Company, and to the facilities and equipment thereof.

The Lorain, Ashland & Southern Railroad Co., of which Joseph Ramsey, Jr., is president, has obtained authority from the Public Service Commission to issue $1,750,000 capital stock, $1,500,000 first mortgage bonds, and $1,200,000 second mortgage bonds. The money is to be used for completing a line of railroad that will connect Lake Erie at Lorain with the Fort Wayne division of the Pennsylvania Railroad at Custaloga.

A reduction of $16,982,832 in the 1912 valuation of the New York Central lines in Ohio

Digitized by Google

is asked by representatives of that system from the State Tax Commission. This is the largest sought since the Commission has been in operation. It is a little more than 10 per cent. of the 1912 valuation, which was fixed at $147,289,670. The largest reduction is asked on the Lake Shore valuation, which the New York Central officials wish decreased $7,390,273. They also ask a reduction of $5,801,647 in the Big Four valuation.

Oklahoma.—State Senator Vandeventer has complained informally to the State Corporation Commission that the railroad companies have stopped selling mileage books in Oklahoma at 2½ cents a mile. Chairman Love, of the Commission, has announced that he will take up the matter of a State mileage book system at once.

Pennsylvania.—The State Railroad Commission has informed the Pennsylvania Railroad that its investigations of the recent accident near Glen Loch had disclosed the fact that the portion of the bridge structure which broke and occasioned the accident was so located as not to be readily examined and its condition properly ascertained by the bridge inspectors.

This fact, the Commission said, shows the necessity of either so constructing bridges or of so locating all parts thereof that in their inspection every portion of the structure may be accessible for proper examination without the danger of overlooking latent or hidden defects.

At the anthracite rate hearing conducted in Philadelphia last month, George Stuart Patterson, attorney for the Pennsylvania Railroad went over the list of questions submitted in advance by the complainants as was done by counsel for the Reading and Jersey Central Railroads. Mr. Patterson said that no figures or accounts existed or could be compiled, showing cost of conducting anthracite traffic.

In reply to request for the production of contracts regarding the apportionment of anthracite freight or the allotment of coal cars, he said there were no such contracts and never had been.

Replying to request for a statement showing the amount of freight transported in the coal cars on their return trips to the anthracite mines he said that the amount of such freight was negligible and was limited to a little iron ore taken part way up the Schuylkill Valley. Mr. Patterson said witnesses would be produced to give exact details.

Robert H. Large, general coal freight agent of the Pennsylvania Railroad Co., testified to the average distances from the various coal fields to Philadelphia via the Pennsylvania and rates.

When asked why the rates for delivering at Greenwich piers for lighterage were about 30 cents per ton lower than the rates for track delivery Mr. Large said that this differential was made to meet a commercial necessity, the object of which was three fold: First, to allow a compensation for the breakage, involved in lighterage operations; second, to permit dealers having yards on the water front, but with no track connections, to get their coal on an equal basis with dealers having railway connections; third, to permit dealers having a connection with one railroad and also having a water front to have two ways instead of one of obtaining their coal.

The State Railroad Commission has transmitted to the attorney-general the records in its investigation of the accident on the Lignier Valley Railroad July 5th, in which many persons were killed. The letter states that the company declined to furnish an explanation of its method of handling the wrecked trains or to supply the customary accident report.

Texas.—The State Railroad Commission has issued an order requiring the railroads of Texas to absorb switching charges. This, it is claimed by the representatives of the lines affected, will cause an enormous decrease in their annual revenue. The order is effective January 1, 1913, and is of much importance to the shipping interests of the State. In substance the order requires the railroads to absorb all switching charges on competitive and non-competitive business, with a guarantee of $7.50 transportation revenue on each car. The new rule reads as follows:

"Switching charges shall, in all cases, be absorbed by the line or lines of railway performing the transportation haul on the car switched, cut of the freight charges accruing under the authorized freight rate applicable for the transportation of the commodity shipped between origin and destination stations; provided that the net transportation charge shall not in any case, by such absorption, be reduced below $7.50 per car."

William D. Williams, a member of the State Railroad Commission, and R. D. Parker, engineer of that body, have been making investigations of numerous complaints received on delayed freight shipments on Texas line of the Southern Pacific, particularly the Houston and Texas Central and the Galveston, Harrisburg and San Antonio roads. It is alleged in these complaints that many shippers have suffered heavy pecuniary losses due to delays of shipments in transit.

It is shown by the report of the State Railroad Commission for the fiscal year ended June 30, 1912, recently issued, that there was constructed during that year 615 miles of new main track, making a total of 14,941 miles of railway in Texas. There was an increase during the year of 838 miles of siding track, bringing up the total of this character of track to 3,758 miles. The Pecos & Northern Texas, with 248.83 miles; the Kansas City, Mexico & Orient with 138.46 miles, and the Gulf, Colorado & Santa Fe with 126.58 miles, lead the increases. Three new lines, the Brownwood North & South, with 19.16 miles; Jefferson & Northwestern, with 40.01 miles, and Port Bolivar & Iron Ore Railway, with 29.66 miles, were placed in operation with 88.83 miles of track between them.

It is stated that an investigation will be made by the State Railroad Commission to determine to what extent the Missouri Pacific is to bring the International and Great Northern into its system.

Digitized by Google

ORGANIZATION.

Urge Lower Auto Rates.—The Southern California Automobile Dealers' Association, held a meeting at Los Angeles, Cal., last month at which they inaugurated a National Campaign for obtaining lower rates from the railroads of the United States on trans-continental shipments of automobiles and accessories.

Their effort will be to secure a permanent revision of car load rates on a comparative basis with horse drawn vehicles and other lines of manufactured products of similar value.

Industrial Traffic Leagues Appeal to Shippers and the Railroads.—To obtain clean cars the National Industrial Traffic League has issued the following statement.

Shippers are entitled to clean cars for loading and they do not get them always.

This was due to consignees of certain commodities leaving refuse in cars.

The National Industrial Traffic League should urge its members to clean cars thoroughly after unloading them and to leave nothing in the cars.

The league should use its influence with the railway associations toward having railroads issue instructions that shippers be furnished with clean cars.

Railway Clearing House of America.—In a recent meeting of the Society of Railway Financial Officers, in the membership of which 100 of the leading roads of the United States and Canada have representation, it was decided to establish the "Railway Clearing House of America." Its purpose is to clear or settle, with the payment of but little actual cash, all the balances between railroad, steamship and other companies now paid by draft.

The plan is in the hands of a special committee consisting of T. H. B. McKnight, treasurer of the Pennsylvania lines west; F. H. Hamilton, treasurer of the Frisco; H. C. Ansley, treasurer of the Southern; Byron Cassell, treasurer of the Monon; H. P. Connor, treasurer of the Pennsylvania Company; and W. H. Davis, controller of the Delaware & Hudson.

The committee has reached the conclusion that the proposition is feasible and will assure economy in making settlements, including interline charges for repairs to cars, expenses of joint facilities, allotments of pro rata share of fares, and miscellaneous bills. This will reduce the work of the accounting and treasury departments.

Safeguards necessary to preclude the possibility of losses by the defalcation of an employee or the failure of any road to pay its indebtedness to the clearing house can easily be provided. The management will be in the hands of 13 directors, six of them financial officers of different systems, six accounting officers and the other the president of the society.

There are in America nearly a thousand different transportation concerns which are eligible for membership in this association.

Annual Meeting of American Association of Freight Traffic Officers.—The annual meeting of the American Association of Freight Traffic Officers was held at Chicago on November 15th. Officers were elected for the ensuing year as follows: President, W. B. Groseclose, assistant freight traffic manager Missouri, Kansas & Texas Ry., Chicago, Ill.; first vice-president, Brent Arnold, general freight agent Louisville & Nashville Rd., Cincinnati, O.; second vice-president, L. N. Chalenor, freight traffic manager Seaboard Air Line, Norfolk, Va.; third vice-president, Paul Wadsworth, freight traffic manager Delaware & Hudson Co., Albany, N. Y.; fourth vice-president, G. A. Blair, general traffic manager Chicago & Alton Rd., Chicago, Ill.; secretary-treasurer, E. B. Crosley, general coal freight agent Philadelphia & Reading Ry., Philadelphia, Pa. At the annual banquet in the evening addresses were made by Wm. Ellis, W. L. Ross, president of the Toledo, St. Louis & Western; B. A. Worthington, president of the Chicago & Alton; W. H. Manss and W. D. Nesbit. George A. Blair, general traffic manager of the Chicago & Alton, presided as toastmaster.

Annual Meeting of the American Society of Mechanical Engineers.—The annual meeting of the American Society of Mechanical Engineers was held at the Engineering Societies' Building in New York, on December 4th, 5th and 6th. On December 5th, a railroad session was held and two papers were discussed, concerning the selection of locomotives with relation to the economics of railway operation, and the other on train lighting. The papers on which the discussions were based, were presented by O S. Beyer, Jr., of the Rock Island lines, and D. F Wood, of the Pennsylvania, and H. A. Curry, of the New York Central lines. Mr. Beyer's paper was divided into five sections as follows: (a) Service, typography, train speeds and train resistance. (b) Size and types of locomotives for passenger, freight and switching service. (c) Permanent plant and its relation to motive power selection, including track, yard and passenger sidings, locomotive terminals, shop facilities and clearances. (d) Relation of operating expenses to the selection of motive power, including transportation expenses, maintenance of equipment, maintenance of way and structures and overhead charges. (e) Final determination of the most economical locomotive to adopt.

The paper on train lighting was divided into seven sections as follows: (1) Brief historical sketch of car lighting, describing the periods of candle lighting, oil lighting, the various types of gas lighting, and finally the period of electric lighting. (2)The electric period from the first straight storage systems to date is discussed in detail and the storage battery, head end system and axle generating system are all presented with the reasons leading up to their adoption and the good and bad points of each. (3) Under the axle generating system the requirements for successful operation are discussed at length. Various types of suspension are described, also the regulators of different systems. (4) The question of voltages is discussed and in this connection lamps and fixtures with deflectors, etc., are covered. (5) Standardization of voltages and batteries. (6) Tabulation showing the number of electrically lighted cars, types of batteries, voltages, numbers of cells, etc. (7) A train lighting biography arranged in chronolog-

Digitized by Google

ical order is appended to this paper. A number of experts on passenger train lighting have signified their intention of discussing this paper.

The officers for the coming year, which were recently elected by mailed ballots, were announced as follows:

President, W. F. M. Goss, dean of the Schools of Engineering of the University of Illinois, and former dean of Perdue University; vice-presidents, James Hartness, Springfield, Vt.; I. E. Moultrop, Boston; H. G. Stott, New York City; managers, W. B. Jackson, Chicago; H. M. Leland, Detroit; Alfred Nobles, New York City; treasurer, William H. Wiley, New York City. The president serves for one year, and the other officers for periods of varying length.

Annual Convention of the National Rivers and Harbors Congress.—At the closing session of the Annual Convention of the National Rivers and Harbors Congress, held in Washington last month, a resolution was adopted calling for an annual Congressional appropriation of at least $50,000,000 for waterway improvements. Another resolution urged the creation by Congress of a Department of Public Works, of which the corps of army engineers would be a part. The waterway congress also passed a resolution congratulating Congress "upon its grant of immunity through the recently enacted Panama Canal law from tolls upon ships engaged in our coastwise trade and upon the protection to waterborne commerce afforded by said law against railroad ownership or control of water lines."

American Railway Association Acts on Car Shortage Case.—The committee recently appointed by the American Railway Association, headed by Fairfax Harrison, to prevent the delay and diversion of freight car equipment, had acted on its first case, a complaint of the Baltimore & Ohio against the Wheeling & Lake Erie. The committee found that the condition complained of was due in a large measure to many cars of the Wheeling & Lake Erie being scattered over other roads, and not available for use by the Wheeling for several months. Deeming its function to be the remedying of the immediate situation first, the commission obtained, through the co-operation of other roads, a promise of prompt and direct return of the Wheeling & Lake Erie cars, so that the latter company would be able to return cars of the Baltimore & Ohio.

Annual Meeting of the Local Agents of the Frisco Lines.—A two days' session of the Frisco Local Agents' Association was held in St. Louis, last month, and interesting addresses were delivered by A. Hilton, general passenger agent, A. Douglass, vice-president of the Frisco. Sixty agents, representing ten divisions and four terminals of the Frisco, were in attendance.

The association is a link in the policy of the Frisco to extend the authority of the agents, and is formed for the purpose of proposing and promoting measures that will bring about more cordial relations between the railroad and the public, and also straighten out any tangles in which the various duties of the agent may have involved them, and thereby secure higher efficiency. The officers of the association are: R. C. Mills, president; W. P. McNair, vice-president; I. R. Drett, secretary.

Joint Southern Passenger Conference.—Members of the Southwestern Passenger Association and the Southeastern Passenger Association met in Galveston, Texas, on December 11th. About a hundred members were present, the former association being presided over by J. E. Hannegan, of St. Louis, and the latter by Joseph Richardson, of Atlanta. This is the first time these associations have met in Texas, and the second time a joint meeting has ever been held.

Trainmen Elect Officers.—The Legislative Board of the Brotherhood of Railway Trainmen was organized at Harrisburg, Pa., last month, and the following officers were elected: Chairman, G. B. Rowand, Linwood; vice-chairman, S. L. Curry, Philadelphia; secretary, H. C. Evans, Philadelphia; legislative representative, M. T. Robinson, Harrisburg.

These officers form the Executive Committee.

Railroads Defended at Social Service Conference of American Unitarian Association.—At the first Social Service Conference of the American Unitarian Association held in Boston, in December, James O. Fagan, of Waltham, who has written several books on railroad topics, charged that many criticisms of railroad enterprise are grossly exaggerated. He shrank from sweeping defence of the railroads, but asserted that American railway systems "are being moralized from the top and demoralized from the bottom." To show that they are subject to exaggerated criticism, Mr. Fagan pointed to the many spurious claims constantly brought against the companies and to the accidents to trespassers on railroad property that amounted in 1911 to 5,284 killed and 5,614 injured.

LABOR.

Settlement of Grand Trunk Pacific Strike.—The strike of the Grand Trunk Pacific machinists which has extended for more than a year and prevented the opening of the $3,000,000 shops at Transcona, Winnipeg, has been settled and the shops opened.

Settlement of Engineers' Wage Controversy.—The settlement of the eastern engineers' wage question by the arbitration board appointed for that purpose as well as the progress which has been made during December in the settlement of the demands of the firemen for increased pay and certain changed working regulations, will be found more fully discussed in another section of this issue.

Baldwin's Payrolls Reach Maximum Number.—The Baldwin Locomotive Works, at Philadelphia, has now on its payrolls the greatest number of men in the history of the industry, approximately 19,500. This compares with 19,200 in 1907, the highest previous record. President Alba B. Johnson says:

"The Baldwin Locomotive Works is now operating at the highest capacity ever reached. The outlook for the railway equipment business is good for at least five or six months ahead."

Digitized by Google

Increase in Salaries by Pullman Company.—Twenty-five hundred office employees of the Pullman Company have had their salaries increased from 6 per cent. to 12 per cent., which means an additional expenditure by the Pullman Company for this purpose of about $300,000 per annum. Those sharing in the increase included clerks, bookkeepers, stenographers and other office employees, with the exception of officials.

President Taft Names Industrial Commission.—President Taft has named the following men as members of the Industrial Commission, created by Congress to investigate working conditions and endeavor to make more amicable the relations between capital and labor: Senator George Sutherland, of Utah; George B. Chandler, of Connecticut; Charles Simon Barrett, of Georgia; Frederick Delano, of Illinois; Adolph Lewisohn, of New York; Ferdinand Charles Schwedtman, of Missouri; Austin Bruce Garrettson, of Iowa; John B. Lennon, of Illinois; James O'Connell, of the District of Columbia.

Steel and Labor.—In a recent address before the Rochester Chamber of Commerce, Col. H. P. Mope, vice-president of the Carnegie Steel Company, strongly defended the steel corporation's attitude towards its workmen and its treatment of them, and declared that "in the great upward movement of humanity for better treatment, for better living, and for all the conditions which tend to a broader humanitarianism, broader civilization, and a greater degree of progress, the steel corporation has not been and will not be found lacking in interest, nor in support of such movements to the extent of its ability."

It is announced that the steel corporation has planned an adjustment of wage scales which will soon result in material increases particularly with respect to the wages paid unskilled labor. It is understood that not less than thirty thousand laborers will be benefited by this readjustment, and it is not improbable that many other employees in various minor capacities will share in the new scale.

Western Maryland President Honored by Road Force.—Last month, Alexander Robertson the retiring president of the Western Maryland Railway, was the guest at a banquet given to him by the conductors, firemen, engineers and general trainmen of his road. It is said to be the first dinner of its kind in railroad history and was a huge success. Those who attended included: J. M. Fitzgerald, who became Mr. Robertson's successor on January 1st; J. T. Hendricks, vice-president; L. F. Timmerman, secretary and treasurer; J. A. Shepherd, general manager; Austin Gallagher, industrial commissioner; F. M. Howell, general passenger agent; Superintendents F. L. Brendel, H. H. Berry and C. A. Steiner; C. M. Tritsch, superintendent of motive power; Dr. D. Z. Dunott, chief surgeon; W. T. Stringer, chief clerk to the president, and Edward Early, paymaster.

The dinner was the result of the great personal popularity of Mr. Robertson with the rank and file of the road's employees, and indicates how close association with the men can bring about results beneficial to the entire service. The following organizations were concerned in arranging the dinner: Order of Trainmen, Order of Railway Conductors, Brotherhood of Locomotive Engineers, Brotherhood of Locomotive Firemen and Engineers.

Labor Scarce in the Northwest.—There has been a scarcity of railroad labor in the northwest for a number of months. These conditions have so effected improvement work that none has recently been done except that which is absolutely necessary. It is generally believed that the cause of the shortage is the construction work on the Grand Trunk Pacific and the Canadian Northern lines, which has largely depr.ved the American Northwest of the laborers usually available. Commenting on this situation, an official of one of the Northwest roads recently said: "That with the Canadian Government subsidies and a plentiful supply of cash they have been able to make offers to railroad laborers which American railroads have been unable to meet. When these roads are finished, I expect to see a readjustment of conditions, which will send laborers back to this country and remedy the labor shortage in the American northwest."

EQUIPMENT.

Heavy Orders Placed During 1912.—The equipment orders of the railroads during 1912 were heavier than for any preceding year since 1906. Owing to the uncertainty which has to some extent governed railway operations during the past three or four years, the carriers had ordered only such equipment as was necessary for current demands. This year's remarkable increase in tonnage however, has forced many of the railways into the market for large supplies, and the purchase of cars and locomotives both in the passenger and freight service, were far in excess of those for 1911. Prices hardened somewhat in December and it was predicted that this would cause a shortening of orders. This has not been noticeable, however, up to the present time, and the equipment companies closed the year with the largest business on their books that has ever been known for this season. There are certain additional large orders also in sight, notably, those of the New York Central and Harriman Lines, so that it appears from the present outlook that the supply houses will have an abundance of work during 1913.

A feature of the year was the establishing of a record in steel car building, a great preference being shown for this class of equipment, both in connection with freight and passenger cars. Heavy orders were also placed for steel rails, and it is estimated that the rail rolling for the year amounted to about 3,500,000 tons. If orders already placed for 1913 are included, this total is increased to approximately 5,000,000 tons.

Among the important rail orders during December were: 30,000 tons for the Southern Pacific; 15,000 tons for the Canadian Northern; 58,800 tons for the Pennsylvania; 50,000 tons for the Southern Pacific; 25,000 tons for the Philadelphia and Reading and 1,500 open hearth steel rails for the Chicago, Rock Island and Pacific.

In the car and locomotive field, the Santa Fe

Digitized by Google

is reported as having ordered 45 locomotives; the Rock Island 35 locomotives, 100 box cars, 500 coal cars, 250 refrigerator cars, 50 way cars and 68 passenger coaches. The Pittsburgh and Lake Erie, 2,000 steel hopper cars; the Delaware, Lackawanna and Western, 19 freight locomotives and 3 passenger locomotives; the Norfolk and Western, 500 steel underframe stock cars; Atchison, Topeka and Santa Fe, 45 locomotives; the Southern Railway, seven locomotives; the Illinois Central, 55 locomotives; the Chicago and Alton, 40 locomotives and the Pennsylvania Railroad, 3,000 freight cars. Besides these orders, it is understood that the Harriman Lines have put out inquiries for 12,000 freight cars, which call for a general assortment of hoppers, gondola, box and other types. It is also expected that an approval of the plans of the New York Central Lines by the Public Service Commission of Ohio, will be followed by an expenditure of nearly $14,000,000 for motive power and car equipment. The Harriman Lines are also reported to be making inquiries for bids on 246 locomotives and the St. Paul management has authorized the addition of about 10,000 freight cars to the company's rolling stock, a great majority of which will be built in the company's own shops at the rate of about 780 per month.

Union Pacific Wireless Line.—The Union Pacific Railway has made application to the Department of Commerce and Labor at Washington for a license to operate and maintain a wireless telegraph system along its lines. The company wishes to install a technical experiment station and the Government is requested to give permission for such a station which, it is stated, will be the second of the kind in the country. Several wireless stations, it is announced, will be constructed when the license is issued.

The Steel Passenger Car Equipment of the Pennsylvania.—The Pennsylvania Railroad has announced that it will shortly have available for use on the lines of its system a total of 2,872 solid steel passenger equipment cars, probably more than one-half of the all-steel passenger equipment in the United States, and representing an expenditure of approximately $40,000,000.

These steel passenger cars have been added to the company's equipment since June, 1906, when it was announced that all future additions to passenger equipment on the Pennsylvania system would be of all-steel construction.

New Safety Device on Grand Trunk.—The Grand Trunk Railway has adopted a device invented by Superintendent J. Coleman, of the car department at Point St. Charles, Montreal, for preventing the telescoping of passenger cars. It consists of a centrifugal lock in the center plate of the car to make the body of the car and the truck on which it rides a solid unit as far as practicable.

As the body of the car at present merely rests upon the trucks, unconnected except by a two-inch center pin, when the motion of the car is suddenly arrested the car readily leaves the trucks and strikes the car ahead. It is claimed that by making a rigid connection between the car body and the truck, the brake force will act equally on both.

Mr. Coleman's invention is simple, containing only five castings, which, when assembled, resemble two large nuts, one superimposed upon the other and held together by vertical keys and pin, which are easily removed. President E. J. Chamberlin is so favorably impressed with this device that he has ordered it to be added to all future equipment. It is now being built into 96 Grand Trunk passenger cars.

Grand Central Terminal in New York to Open in February.—The new Grand Central Station in New York will be completed early in February. The new building will have 100,000,000 cubic feet of space, and it is reported that the cost of construction and enlargement of the yards will be more than covered by the value of the new hotel, club and business buildings which will be erected on reclaimed adjacent property. The completion of this new terminal will rank it with the Pennsylvania Terminal, as the two greatest railway passenger stations in the world.

Queen and Crescent Improvements.—Modern reinforced concrete coal schutes of the bucket hoist type, each with a capacity of 300 tons, are to be erected by the Cincinnati, New Orleans & Texas Pacific Railway, at Danville, Ky., and Oakdale, Tenn., to take the place of the present facilities for coaling locomotives at these important divisional points, according to announcement made by the General Manager, Horace Baker. Announcement was also made that additional facilities would be provided at Lexington, Ky., consisting of an 80-ft. turntable and pit and additional tracks. Authority for the construction of these improvements has been granted and work will be begun as soon as possible.

CONSTRUCTION.

Northern Pacific Extension.—The Northern Pacific has announced that its Cowiche branch in the Yakima Valley will next year be extended ten miles to Tieton Village, in the heart of the newly settled Tieton unit of the Yakima irrigation project. Two miles must be built through a rocky canyon of the Cowiche River at great expense.

Buffalo, Rochester and Pittsburgh's Double Tracking.—Beginning early in March, 1913, the Buffalo, Rochester & Pittsburgh Railway Company will double track its Rochester Division between Ellicottville and Springville. Work on the Rochester Division alone, which is 124 miles long, will require an expenditure of $6,000,000. The work on the Buffalo Division will require an additional $2,500,000.

To Reduce Alton Grade.—The Chicago and Alton has appropriated $750,000 for the proposed grade reduction in the vicinity of Atlanta, Ill., twenty miles south of Bloomington. Eight years ago the work was started, but after $100,000 was expended it was learned that the expense would far exceed the estimate and work was ordered stopped.

Digitized by Google

New Bridge for Wabash.—The Wabash is at the present time spending a large amount of money in renewing its bridge over the Illinois River at Valley City. The new bridge takes the place of a structure built twenty years ago, which is now too light to carry modern equipment. The structure consists of five heavy steel spans including the draw span which is operated by a novel internal combustion engine.

Central of Georgia to Enter Pensacola.—Announcement has been made that the Central of Georgia plans to enter Pensacola in the near future, by an extension of the line from Andalusia, Ala., to the Florida gulf port. Recently the Central of Georgia acquired what had originally been a lumber tram line from Union Springs, Ala., to Andalusia, later developed to a standard gauge.

Work on Northwestern Lines.—The Great Northern has decided to continue construction work throughout the winter on the Eastern Washington and British Columbia branches.

Rapid progress upon the grading for the Kettle Valley Railroad between Kettle River and Penticton, B. C., is reported by the contractors. The line will be one of the finest scenic routes in British Columbia, running 3,000 feet above Lake Okanigan, with the lake in sight most of the way. Grading is very heavy through solid rock.

Baltimore & Ohio Opens New Tunnel.—A new double track Sand Patch Tunnel on the Baltimore and Ohio was opened in December.

Three years ago the management began construction of a third track across the Allegheny Mountains and a general rehabilitation of the property through enlargement of facilities and purchase of new equipment at a cost in round figures of $60,000,000. The tunnel is at the summit of the Allegheny Mountains, between Sand Patch and Manilla, Pa., thirty miles west of Cumberland. Its cost was approximately $1,250,000.

To Shorten Line Between Baltimore and Washington.—It is understood that the Baltimore & Ohio Railroad has nearly completed its plans for a material shortening of its line between Baltimore and Washington. It is estimated that something like seven minutes will be cut off running time of express trains between the two cities.

In brief, the railroad company's plan seems to be to build new tracks for the use of express trains from a point north of Lansdowne in Baltimore County to a point near Hanover in Howard County. The new link will be about six miles long and will eliminate relay and the long curve at that place, likewise, the big curve in the vicinity of Lansdowne. It has not been stated how soon this work will be undertaken.

Santa Fe to Build Cut-Off.—The Santa Fe will build a cut-off through Oklahoma and Texas to connect its northern division with the gulf system. It will run between Long View and Tulsa, Okla., via Paris, Tex. About 350 miles of track will be built. The line is of importance because it means the establishment of a new north and south line of Santa Fe extending from Kansas City and northern points on its system, to the gulf coast, with branches into Louisiana and the timbered territory of east Texas.

The Santa Fe now has a branch line from Kirbyville, Tex., to Oakdale, La., and it is said that this is to be extended to New Orleans. This, with the new cut-off referred to, will give the Santa Fe a direct route between northern points and New Orleans. The Long View Division now runs to Port Bolivar, across the bay from Galveston. This line passes through Beaumont. From Silsbee the Santa Fe has a branch running to Sommerville, the latter place being on the present north and south trunk line of the gulf division. The proposed cut-off will shorten the distance between Chicago and the gulf, 150 miles via the Santa Fe.

NEW ROADS

New Texas Road.—The charter of the Dallas, Corsicana and Palestine Railroad Company has been filed at Austin. The company has a capital stock of $400,000. Its purpose is to construct a railroad between Palestine and Corsicana, and to ultimately extend the line from Palestine to Dallas. It is stated that S. W. Fordyce, of St. Louis and associates are the financial backers of the project. The incorporators named in the charter are: G. J. Heflin, J. A. Thompson, of Corsicana; Tucker Royal, C. Roe Hall, C. W. Banks, W. B. Flannigan, of Palestine; P. D. C. Ball, of St. Louis; L. E. Mitchell, of Neosho, Mo.; Kelly Brent and T. T. Crittenden, Jr., of Kansas City. The company has its principal office at this place.

New Railroad for Tennessee.—That middle Tennessee is to have a new railroad, opening up a vast field for timber and mineral development and an attractive agricultural section for immigrants, is the announcement made at the Industrial Bureau in the authorized statement that surveys have been completed for grading the roadbed of the Tennessee Valley Iron & Railroad Co., which proposes to construct with the co-operation of the Louisville & Nashville, a new line connecting Iron City, in Lawrence County with McGlamery's Stand in Wayne County. That Nashville will be the headquarters of this new road is an equally interesting and important announcement by the projectors of the enterprise.

It is further proposed that in a year or so, provided the proper encouragement is given the enterprise, to extend the road double the original distance contemplated, making it continue 20 miles farther to Martin's Mills, or a total of 40 miles. The leading spirit of the new movement is W. W. Collin, of Pittsburgh, who has been in Nashville for some time consulting with the Industrial Bureau and other interests hopeful for the success of the enterprise.

New Kansas-Nebraska Road.—The Anthony & Northern Railway has been incorporated to build a line from Anthony, Kan., to Hastings, Neb., 275 miles, with authority to build through Harper, Barber, Pratt, Stafford, Pawnee, Rush, Ellis, Rook and Phillips counties.

New Missouri Line.—The Nevada, Lebanon and Eastern Railway, with a capital of $1,000,000,

Digitized by Google

has procured a Missouri charter to build a line about one hundred miles long, connecting the county seats of Vernon, Cedar, Polk, Dallas and Laclede counties.

Reincorporation of the Lake Erie and Youngstown.—The Lake Erie and Youngstown Railroad has been reincorporated at Columbus, Ohio, with $300,000 capital. Argument has been made before the State Public Service Commission to turn over the $300,000 stock of the old company in return for the right of way and other property. An application for permission to increase the capital to $4,700,000 was also made. This road is to connect Connaut and Youngstown.

LAND AND INDUSTRIAL.

Beef Producers' Special.—The Iowa Beef Producers' Association in conjunction with the Chicago & Northwestern Railway ran a special "beef cattle train" across the State of Iowa during the third week of December. A number of well-known cattle raisers were aboard the train and delivered lectures on Ensilage Feeding and the Influence of Beef Production on Farm Fertilizing.

Enlarging Land and Industrial Work on Southern Railway.—The Southern Railway Company has enlarged the work of its Land and Industrial Department in the South by opening three new offices to be located at Birmingham, Ala., and Knoxville and Chattanooga, Tenn. These new offices are established in harmony with the policy of the Southern Railway to cover just as fully as possible the development of the agricultural and manufacturing and other interests in its territory.

Efforts to Attract Immigrants to the Northwest.—Three Milwaukee railway exhibit cars will traverse Minnesota, Iowa, Missouri, Wisconsin, Illinois and Indiana during the next six months. The object is to attract immigration into Washington, Montana and the Dakotas ahead of the opening of the Panama Canal, through which European immigrants will be pouring into coast States within one year. That Washingtonians may see the exhibits sent east, one exhibit car is now touring Washington, going thence through Montana cities to St. Paul. For three months, beginning January 1st, it will tour the lines of the Minneapolis and St. Louis Railway in Minnesota, Iowa and Missouri. Thousands have visited the car at Tacoma and Seattle. The exhibits comprise grains, grasses, vegetables, fruits and berries of the Dakotas, Montana and Washington.

Helping the Fruit Growers of the Northwest.—With the advice and help of James J. Hill, the Wenatchee Fruit Growers' Association this fall developed a plan of eliminating middlemen selling apples in carload lots direct to retailers, thereby providing a stable market with better prices to growers. The father of the plan is W. T. Clark, president of the association. Mr. Hill, at St. Paul, heard this plan, suggested modifications and gave Mr. Clark letters to leading bankers in Chicago and other cities with an urgent request that they aid in every way possible. At Chicago, Mr. Clark obtained letters to other bankers; each selected banker in large cities was asked to name one reliable wholesaler of fruits or groceries. In every instance the local bank agreed to advance money to this local agent. Twenty such agents in twenty Eastern cities agreed to handle a specified number of carloads aggregating 1,700 carloads owned by the Wenatchee Association. President Clark believes twice as many carloads could have been handled. Storage arrangements were made at St. Louis, Kansas City and Duluth and carload deliveries may be made anywhere in the United States on one day's notice direct from cold storage on the through rate from Wenatchee with storage-in-transit privilege.

Canadian Pacific Lines Held for Actual Settlers.—J. S. Dennis, assistant to the president of the Canadian Pacific Railroad and head of the Department of Natural Resources made an important announcement recently in respect to the future policy of the Canadian Pacific Railroad in connection with the development of the unsold land in the West, of which the railroad company has still 7,000,000 acres ready for the settler. The Canadian Pacific has definitely decided not to sell any more land to speculators, but will offer it to bona fide settlers from North America, the British Isles and Northern Europe.

By the new terms which the company has decided to offer the great tracts of fertile land which lie near or in close proximity to the company's lines in the West and within hail of established towns, settlers will have the privilege of paying the amount of the purchase price of the land in twenty years, instead of ten as heretofore. Furthermore, there will be an additional attraction in the form of a loan of $2,000 from the company, also payable in twenty years with interest at six per cent.

FOREIGN RAILWAYS.

Raising Funds for Chinese Railroads.—Sun Yat Sen, representing the Chinese government, is to shortly visit America for the purpose of raising one-third of a $600,000,000 fund for the construction of an elaborate system of railroads. One-third of this sum will be furnished by the Chinese government. Another third will be subscribed in China. Dr. Sun, in whose hands the foreign negotiations have been placed entirely, will try to raise the other $200,000,000 in America and Europe. The amount will be entirely independent of the $200,000,000 loan to China to be made by the bankers of the five leading powers.

National Ownership in Mexico.—An interesting statement in regard to the status of ownership of the National Railways of Mexico is made by Diario Official, which is the organ of the Federal Government. This statement is called forth by recent charges published in opposition newspapers of the country. The charges were: (1) That the Mexican government, in contracting the loan of $20,000,000 with the house of Speyer & Co., of New York, hypothecated all its stock of the National Railways of Mexico. (2) That in this loan Speyer & Co. paid over only $11,000,000, retaining $9,-

Digitized by Google

000,000 to meet the indemnities which will be claimed for the damages caused by the revolutionists to the railways in general. (3) That, as a consequence of the foregoing, the government is on the point of losing control of the National Railways of Mexico, which it cost so much money and such hard work to acquire.

The answer of Diario Official to these charges follows: "The executive has not and could not have hypothecated the government's stock in the National Railways of Mexico, as the decree empowering it to negotiate the loan of $20,000,000 contained a clause expressly prohibiting it to furnish any guarantee involving the revenues, properties or securities of the nation. The government's shares in the National Railways of Mexico are deposited in the national treasury.

"The firm of Speyer & Co. paid over in full in cash the amount of the loan. In consequence there is no danger of the government losing control of the National Railways of Mexico nor could it pledge its shares in the company, for the reason that the law of December 26, 1906, authorizing the railway merger, expressly declares that the shares of bonds, assuring to the government a voting majority in the general meeting of the stockholders, cannot be alienated or in any manner encumbered without the explicit authorization of the Federal Congress."

To Raise British Railway Rates.—The British government has introduced a bill in Parliament, in redemption of the promise made last year, to allow railways to advance their freight rates and passenger fares, to a point which will recoup them for the advance made in wages. The bill will be supported by the government and it will undoubtedly become a law. The government found it impossible to present to parliament a comprehensive railway bill as had been proposed, but in order to keep its pledge it presented the one clause bill. The provisions of the bill are worth reproducing as an indication of the attitude of the British government toward railway corporations. The last advance in wages was practically forced on the English roads, in some such fashion as the advance of 1908 was forced on American lines. The bill provides:

1. Where on a complaint with respect to any increase (within the maximum) of any rate or charge under section one of the Railway and Canal Traffic Act, 1894, the railway company proves to the satisfaction of the Railway and Canal Commissioners—

(a) That there has been a rise in the cost of working the railway resulting from improvements made by the company since the nineteenth day of August, nineteen hundred and eleven in the conditions of employment of their staff; and

(b) That the whole of the particular increase of rates or charge of which complaint is made is part of an increase made for the purpose of meeting the said rise in the cost of working; and

(c) That the increase of rates or charges made for the purpose of meeting the rise in the cost of working is not, in the whole, greater than is reasonably required for the purpose; and

(d) That the proportion of the increase of rates or charges allotted to the particular traffic with respect to which the complaint is made is not unreasonable,

Commissioners shall treat the increase of charges as justified.

The railways will have the power under this bill to make a general increase in their rates to the extent of the increase in wages. How far they will go and how promptly they will take advantage of this legislation is not known, but the presumption is the railroads will shortly advance rates. The shippers are expected to object but under the bill reasonable advances are certain to take place.

The action of the British government is in strong contrast with the treatment American railways received from those in authority. Our roads had, in one or two cases at least, arranged with their men, five years ago for a reduction in wages, but this was upset summarily by Washington, and our railroads have never to this day, been allowed to make a general increase in rates to compensate them for what they insisted was an unwarranted advance in wages.

VOL. LVII. FEBRUARY, 1913 No. 2

Important Developments in the Transportation Field

THE POSTOFFICE AND THE RAILROADS.

Keen interest is displayed in the results of the working of the Parcel Post. That the express companies have been hard hit by the new competition is known although officials of the companies are inclined to minimize the damage which has been done. There is no doubt, however, that even in the absence of official figures, the Parcel Post is doing an enormous business and that this business is rapidly increasing. It is altogether too soon to pass final judgment upon the results of the competition between the express companies and the Postoffice Department. That the Department will have a large fight to maintain its present advantage is, however, already clear. Certain points of advantage in favor of the express service are already apparent. The Government charges ten cents for insurance on values up to $50. It can work its employes only eight hours a day. The Department is to some extent, limited in discharging employes by civil service protection. Additional appropriations will be needed to increase the force sufficiently to handle the increased business. There is, also, difficulty in preparing packages for easy and prompt inspection, and finally, there is the disadvantage of compelling patrons to wait in line to get packages weighed and to buy stamps.

The express companies are also planning to vigorously compete with the Postoffice. Mr. C. R. Graham, Traffic Manager of the Wells Fargo Company, has announced that his company will underake competition, national in scope, with the federal Parcel Post, as soon as plans on which the company has been working for the last four years can be put into operation. This competition will be mainly on the long haul and will have special regard to perishable foodstuffs.

Meanwhile the railroads have not ceased their efforts to obtain justice at the hands of Congress, which by the Parcel Post law, has, on the one hand, reduced their revenues, and on the other, increased their expenses. It is estimated that the operation of the Parcel Post will cause the railroads a loss of $54,000,000. This loss comes in various forms. A large amount of light express matter, up to eleven pound packages, is being sent by Parcel Post. In handling this matter by express 50 per cent of the cost goes to the railroad, and the same amount to the express company. When this matter is transferred to the mail department, the railroads will have to handle it free of charge until the expiration of their contracts. Contracts are made by the Postoffice Department every four years, based on the volume

of mail handled during a period of three months in which the mail is weighed and a record is kept. The railroads are paid for the next four years on the basis of $20 a ton per mile per year. In New England the weighing has already been done, so for four years the railroads in that section must handle all of this additional matter free of charge unless some special provision is made. Some districts have three years remaining and the fourth district one and one-half years.

The railroads have taken advantage of this opportunity to open the whole question of the basis of payment for mail carriage. Mr. Jonathan Bourne, Jr., chairman of the Senate Committee on Postoffice and Post Roads, in September addressed a letter to the chairman of the Railroads' Committee on Mail Pay, asking certain questions bearing on the subject of mail pay to common carriers. Reference to these questions and the answers given by the railroads, have been issued by the Committee on Mail Pay. The following is an extract from a letter from Ralph Peters, president of the Long Island Railroad Company and chairman of the committee, to Senator Bourne:

"Q. Do you deem the present plan of compensation an equitable one as between the Government and the railroads? If not, in what respects and as to what classes of railroads is it inequitable?

"A. The existing law has never worked to the advantage of the Government, but has failed to do justice to the railways by reason of infrequent weighing; absence of pay for nearly 40 per cent of the space occupied as traveling post offices; the performance, without pay, of side and terminal messenger service, and the unjustifiable reduction in pay by the Act of Congress dated March 2, 1907, supplemented by Order No. 412 of the Postmaster General changing the divisor.

"The present law is based upon correct principles, but should be so amended as to provide—

"(a) For the repeal of the Act of March 2, 1907.

"Notwithstanding the large increase in every other item connected with the administration of the Postoffice Department, the railroads' pay has been singled out as the one element in these operations for concentration of economies. This too, in the face of the fact that the operating expenses of the railroads have been greatly augmented by the requirements of the law with reference to steel equipment, and a general increase in cost characteristic of all business operations.

"(b) For annual weighings, and a definite and just method for ascertaining daily average weights.

"Under the quadrennial weighing all increased weights of mail during the next succeeding four years is carried by the railroads without any compensation whatever, which is manifestly unfair.

"The railroads must provide car space and facilities for the maximum weight offered at any time, yet they are paid only for the average weight carried. The Postmaster General's order covering the divisor has unfairly reduced this average.

"This provision is essentially necessary in view of the bill establishing the Parcel Post, effective January 1, 1913, which will result in taking from the express service traffic for which the railroad companies now receive compensation and transferring it to the mail service; the bill referred to containing no provision for payment to the railroad companies for the increased tonnage to be handled in mail cars, although such provision was made for the star routes and the city wagon service.

"(c) For pay for apartment cars on some basis that will compensate for the service.

"That the Postmaster General has himself recognized the justice of such a change, is indicated in the following quotation from page 3 of House Document No. 105:

"'* * * * an additional amount may be allowed for railway postoffice cars when the space for distribution purposes occupies forty feet or more of the car length. No additional compensation is allowed for space for distribution purposes occupying less than forty feet of the car length. This distinction is a purely arbitrary one and without any logical reason for its existence.'

"(d) For a fair allowance to the railroads for the side and terminal messenger service which they perform for the Postoffice Department, according to the value of this service to the Postoffice Department.

"The necessity for this is also emphasized by the establishment of the Parcel Post which will undoubtedly add greatly to the expense of the service.

"(e) That all rates of pay should be definite and not subject to the discretion of the officers of the Postoffice Department.

"Other inequities exist under the present law, but are due to the administrative methods rather than to the law itself."

ARBITRATION IN LABOR SETTLEMENTS.

The firemen in the Trunk Line territory are not making much progress in the settlement of their difficulties with their employers. The managers' committee suggested arbitration of the differences between the parties along the lines of the engineers' arbitration. This was, however, rejected by the firemen, whose leaders have ordered a strike vote after having invoked the mediation of the Erdman Act. This dispute is taking the usual course, including negotiation failure, contest over mediation and arbitration, strike vote. The main difference between the parties concerns the form of arbitration. The firemen oppose a board of outsiders. They want the controversy settled by agreement between their own representatives and representatives of the railroads, with an arbitrator called in only in case of disagreement. In

FOUR MEN PROMINENT DURING JANUARY IN THE FIREMEN'S WAGE CONTROVERSY.

the meantime, the trainmen are expected to bring forward their demands for higher wages.

The suggestion developed in the report of the board which arbitrated the engineers' demands, that a method of compulsory arbitration should be employed, is not meeting with general favor. *Financial America* has conducted a symposium among prominent railroad men, public officers, officials of labor organizations, and officials of the National Civic Federation, which shows clearly that the proposal for compulsory arbitration will meet with little support, even in some quarters where support might have been expected. For example, Mr. L. E. Johnson, President of the Norfolk and Western, says:

"Compulsory arbitration is not consistent with our form of government. A commission, however, formed by the Government in a proper and judicious manner with a reasonable amount of power, would practically make arbitration compulsory, as the public opinion would be so strong against either side that refused to accept the aid of such a commission to settle controversies that they would lose their case before it was begun."

On the other hand, President Brown of the New York Central, and President Underwood, of the Erie, favor the principle of compulsory arbitration. The most interesting letter received in response to the circular, is by Mr. Ralph N. Easly, chairman of the Executive Council of the Federation. Mr. Easly says, among other forcible comments:

"I am opposed to compulsory arbitration on general principles. Without going into the ethical or abstract side of the question, I am opposed to it for the reason that it is an impracticable proposition as well as constitutionally impossible under our present form of government. It has failed in every country where it has been tried, for the simple reason that you cannot make a man work against his will and in industrial plants you cannot make an employer employ against his will. In the case of railroads and other public utilities you cannot make the workmen work against their will but you can, under the terms of its franchise, make the corporation continue service whether it so wills or not, in which case a compulsory law would be a jug-handled proposition and therefore manifestly unfair.

"In New Zealand, where it first had its trial, the labor unions are withdrawing from the plan. In Australia, where they had a strike of 12,000 abattoir workers, the test showed that the compulsory feature was worthless. The men refused to accept the award of the arbitration board and under the law, were fined; they refused to pay the fines and then, under the law, they were headed for jail, but they never found it.

"In Canada, the arbitration law contains a modified compulsory feature, such as a provision that on railroads and public utilities (which were made to include mining), a strike or lockout could not take place until after thirty days' notice. They soon had a test in the form of a strike of 15,000 miners, who struck without giving notice. The men were fined, the fine was not paid, and they were facing imprisonment as in Australia. However, Canada did what Australia did—it simply 'ducked.'

"In a strike last year on the Grand Trunk lines in Canada, it was a railroad that refused to accept the award, and while it was compelled under its franchise to keep its road running, it employed other men and let the strikers go.

"To attempt to force men to work against their will in this country would involve a change in the Federal Constitution (and in every State Constitution) which provides that 'neither slavery nor involuntary servitude * * * * shall exist within the United States.'"

Digitized by Google

As was expected, the attitude of the leaders of organized labor is, without exception hostile to the application of the principle of compulsory arbitration. Thus Mr. W. G. Lee, president of the Grand Lodge of Brotherhood of Railroad Trainmen, says:

"I do not agree that compulsory arbitration of industrial disputes affecting public utility property is either practicable or desirable. In the first place, the employer retains the right, and he will retain it, to employ whom he desires. The employe equally retains the right to give or withhold service at will. To enforce employes of railway companies to give service at wages and conditions that are unsatisfactory would be taking away from them their right to give or withhold service, which is a rather serious proposition when it is considered that the application of compulsory arbitration is alone considered as applicable to railway employes engaged in interstate service."

and Mr. R. L. Reeves, secretary of the Amalgamated Association of Street and Electric Employes of America, characterizes the proposal as follows:

"It would be destructive to democratic organism of society to legislate to compel employes of a private corporation or individual to arbitrate. The employe has no contract with the Government. A locomotive engineer has no contract with the Government. A motorman has no contract with a city. He is not employed by a city. He is employed by the corporation to which the city has conveyed the right of operation of cars under certain agreement called a franchise. That agreement cannot in any way bind a third party, the employe, but public opinion would support the principle of arbitration sufficiently strong to enforce its observance by employes and most strikes would be averted by such an arrangement."

The necessity for compulsory arbitration is based upon the refusal of organized labor to submit its differences with its employers to voluntary arbitration. So long as voluntary arbitration is possible, and in the railway field it is still generally employed, compulsory arbitration is unnecessary.

The leaders of railway labor in taking, as they do, such a pronounced stand against compulsory arbitration, by implication commit themselves to the method of voluntary arbitration. There is every reason to believe that the threat of a general railway strike, even when strike votes are taken, will not prove seriously alarming. Public opinion would not tolerate this method of settling railroad disputes, and without the support of the public, the cause of any large body of working men, engaged in a contest with their employers, is hopeless. It is a safe conclusion that arbitration between railway employers and employes is practically a settled policy in the United States, even though it may receive an occasional set-back.

Reverting to the present difficulty between the Eastern roads and their firemen, the following official statement issued on January 27 by the roads involved is of interest:

"Notwithstanding the offer of the fifty-four railroads in the Eastern section of the country to grant certain increases in wages or to arbitrate their differences with the firemen, the Conference Committee of Managers received no intimation that the firemen were recalling their strike ballot.

"The men are continuing their vote to determine whether or not to strike. The railroads concede that the vote will be favorable to striking.

"A strike means that practically every railroad east of the Mississippi and north of Virginia will be tied up.

"In their instructions to the various lodges, sent out by the Firemen's Committee to all of the branches of the organization, there is this paragraph:

"'Under no circumstances should any person voting be told that "there is no danger of a strike," for it is expected that every man will vote just as he intends to act. If he does not expect to leave the service of the company, if necessary, he should not deceive the officers of the Brotherhood by voting Yes.'

"The railroads stand prepared to grant certain increases; they agree that the firemen deserve adjustments in their wages. Their duties are difficult and their claims merit attention. But the men are taking a strike ballot upon a proposition to demand increased pay amounting to $9,600,000 annually, or 35 per cent of the total amount now paid to firemen in this territory.

"This amount, the railroads contend, is neither warranted by conditions, nor within the power of the companies to pay, having due regard to their other obligations.

"The Eastern railroads insist that their differences with the firemen shall be arbitrated in such a way that the interests of the public, as well as the men and the railroads shall be guarded.

"The form of arbitration followed in the engineers' case protected the public, the employes, and the railroads.

"At a recent conference between the firemen's committee and the railroad managers, President W. S. Carter, of the Firemen, used this language:

"'I speak the truth when I say that railroad employes are anxious that our little private troubles should not result in injury to both of us.

"'This public that you are talking about sometimes had best not know our troubles.'

"'If,' added Mr. Carter, 'there is anything in the world we absolutely refuse to do, it is to go through with what the engineers went through, which was practically a fiasco.'

"The so-called 'fiasco' Mr. Carter refers to was an arbitration before a board composed of Oscar S. Straus, of New York; Charles R. Van Hise, of Madison, Wisconsin; Frederick N. Jud-

son, of St. Louis; Albert Shaw, of New York; Otto M. Eidlitz, of New York; Daniel Willard, President of the Baltimore and Ohio Railroad, and P. H. Morrissey, former grand master of the Brotherhood of Railroad Trainmen. This board was appointed by Chief Justice White of the United States Supreme Court; M. A. Knapp, Presiding Judge of the Commerce Court, and Charles P. Neill, United States Commissioner of Labor."

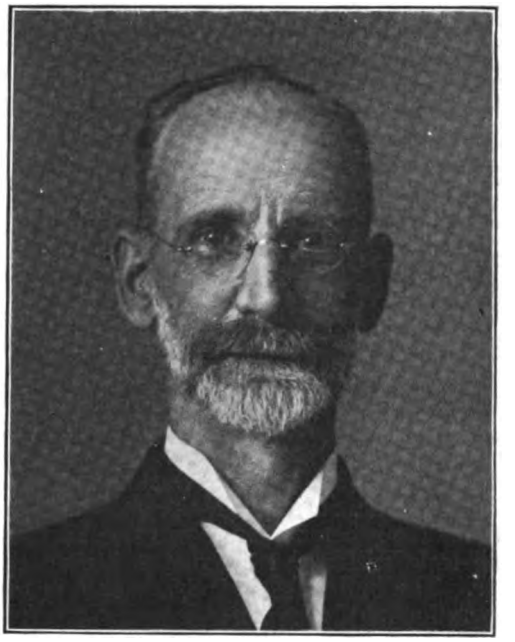
THE PREVENTION OF RAILROAD ACCIDENTS.

Interstate Commerce Commissioner C. C. McChord, in the current number of the *Railroad Trainman,* gives an interesting and comprehensive review of the work of the federal government in the prevention of railroad accidents, and the effect of the measures which have been taken. The reduction in the number of railroad casualties is rightly regarded as one of the most serious national problems now awaiting solution. As Mr. McChord shows, during the twenty-four years covered by the statistics of the Interstate Commerce Commission, 188,037 persons have been killed, and 1,395,618 persons injured on American railroads. Reduced to lowest terms, this means that an average of one person every seven minutes has been killed or injured, and as Mr. McChord says:

"It is pertinent to inquire how much of this fearful record of slaughter is due to the unavoidable risk of the industry, and how much to causes that can be eliminated, as means for the prevention of accidents must obviously be directed to the latter causes."

The figures which he presents show that the railroad responsibility for these accidents by no means corresponds with the total number of casualties. Taking a 20-year period, 1890 to 1909, out of 163,171 persons killed, and 1,190,025 injured, more than 66 per cent of the total number of killed were classified as "other persons" and of these other persons more than 85 per cent were killed while trespassing on the railroads. During the 24-year period more than 53 per cent of the whole number of persons killed on railroads were trespassers.

A determined agitation has, for a long time been in progress, to compel the railroads to elevate their tracks, with a view to preventing accidents of the kind mentioned. The highway crossing accidents are, however, few compared with those occurring at other points along the track. During the five-year period, 1904 to 1909, 4,261 persons were killed at highway crossings as compared with 17,861 persons killed at other points along the track. More than half of the fatal accidents of this country occur through trespassing, and the unfairness of blaming the railroads for these accidents is glaringly apparent. It is here that the most fruitful field for reform in the direction of greater safety lies. Public opinion must be aroused to the point of co-operating with the railroads in keeping people off their tracks.



JAMES O. FAGAN.

Railway signalman on the Boston and Maine, whose recent writings on Methods to Promote Greater Safety in Railway Operations have been widely quoted in the press.

An illustration of the difficulty of protecting railroad property from trespass is seen in Chicago, where an ordinance has been passed, making trespassing a misdemeanor. In spite of the fact that the railroads maintain their own police, it has been found impossible to effectively enforce this order. During one period of three months four companies reported a total of 339 arrests of persons caught in the act of trespassing on the tracks. Less than one-fifth of these, however, were punished. There are only a half dozen states which have legislated upon this subject.

When we turn to the question of prevention of accidents to employes and passengers, we enter a field where public opinion has, for a long time, been aroused and alert, and where legislation and administration have employed their powers to the full-

Digitized by Google

est extent. Commissioner McChord refers to the Safety Appliance Act, with its successive amendments, and claims a great reduction in the number of fatalities as a result of enforcement. In the year 1893, for example, the number of employes killed in coupling accidents was 433, and the number injured was 11,277. The total equipment in that year was 1.3 millions, with but three-tenths million equipped with automatic couplers. In 1911, with 2.4 millions equipment, all of which had automatic couplers, 209 employes were killed, and 2,966 injured.

During the five-year period, 1907 to 1911, collisions and derailments were responsible for 4,163 deaths, and 63,002 injuries. The main cause of these accidents, Commissioner McChord finds, in "the weakness of personal equation in railroading, showing that by far the greater number of these harrowing train accidents were due to human error. The bulletins show that errors in the operation of the train order system are frequent and fatal. Such errors are all of a kind. Dispatchers give wrong orders, or fail to give orders where they are required; operators fail to copy orders correctly, or do not deliver orders that should be delivered; conductors and enginemen misread, misinterpret, overlook or forget orders."

The imperfections in the train order system have led to agitation for the compulsory use of the block system, although this has not yet been enacted into law. Commissioner McChord does not believe that the universal introduction of the block system would ensure immunity from collision since its danger warnings must be observed and obeyed by train operatives who frequently make mistakes. He recommends, in lieu of the block system, the general introduction of some method of automatic train control. The Commissioner refers, with approval, to the operation of the law of March 4, 1910, limiting the hours of trainmen and telegraph operators. It is impossible to say whether the enforcement of this law has resulted in any increase of safety in train operation, but the Commissioner claims that the law has been a great benefit to employes.

Commissioner McChord refers, with approval, to the information elicited under the Commission's authority to investigate collisions, derailments, and other accidents resulting in injuries to personal property.

We come now to the dominating cause of accidents which, according to Commissioner McChord, is as follows:

"Rules have been violated with impunity, with the full knowledge of officials whose duty it was to enforce them, and disciplinary measures have been applied only in cases where disaster has followed disobedience. The crying need in railway service to-day is a sensible and entirely workable code of rules governing the operation of trains; a code that can be obeyed under all conditions of operation; a code the primary purpose of which shall be the prevention of accidents rather than the avoidance of legal responsibility for their occurrence."

In his opinion, many of these regulations are unworkable, and he claims that employes are encouraged to disregard them.

On the other hand, railway officials assert, and the results of certain recent accidents abundantly bear out their contention, that it is extremely difficult to enforce discipline upon their employes, who can always fall back upon the authority of their union to delay punishment or perhaps avoid it altogether. As Mr. James O. Fagan, in an article recently published in the New York *Times*, points out, the engineer who recently ran by his signals near Westport on the New Haven road, and wrecked his train, had been kept in place by union influences, after a record of gross infringements of discipline, and he strongly endorses, in the same article, the proposal that men having to do with the operation of trains be licensed by the federal government as steamboat captains are licensed. "That would keep the head of a union grievance committee from shielding an engineer who would run by his signals; his license would be revoked, as a pilot's license would be revoked who ran his steamer on the rocks."

Returning to Commissioner McChord's article, he calls attention to the increasing number of broken rails, as a cause of accidents, and urges the necessity of an improvement in specifications of rail manufacturers. He gives his unqalified approval to the steel car which is quite rapidly superseding the wooden car on all roads, and he speaks with approval of the law of February 17, 1911, providing for federal inspection of locomotive boilers.

As Mr. McChord concludes, however, laws and regulations are useless without the active and enthusiastic co-operation of railway officials and employes in reducing railway fatalities. There are many signs of an awakening of this co-operative spirit. Safety committees, are now a feature of the operation of many roads, and these committees are "bound to be an important factor in reawakening in employes that old-time feeling of personal interest and pride in the

THE UNITED STATES SUPREME COURT, WHOSE RECENT RULINGS ARE HAVING AN IMPORTANT INFLUENCE UPON BUSINESS METHODS OF LARGE CORPORATIONS.

record of 'our road' that has been so largely dissipated by modern railroad development."

BUSINESS AND THE COURTS.

There has never been a time when the regulative activities of the federal government have more seriously concerned the business community. The scope of federal and state regulation has now so far expanded that there is hardly a day passes without some decision of a court or commission vitally affecting the welfare of great industries.

During the present month, for example, the Supreme Court has decided that James A. Patten and others, charged with violation of the Sherman anti-trust law, in running a so-called "corner" must stand trial in the lower courts, and in this decision settles the question that a corner of any commodity is a restraint of interstate commerce, and a violation of the Sherman anti-trust law. In his opinion, Justice Vandevanter declared that a corner, which, of course, is the buying up of the available supply of a particular commodity, in a particular market, operates "as a forbidden restraint, for it also operates to thwart the usual operation of the laws of supply and demand, withdraws the commodity from the normal current of trade, enhances prices and produces practically the same evils as the suppression of competition."

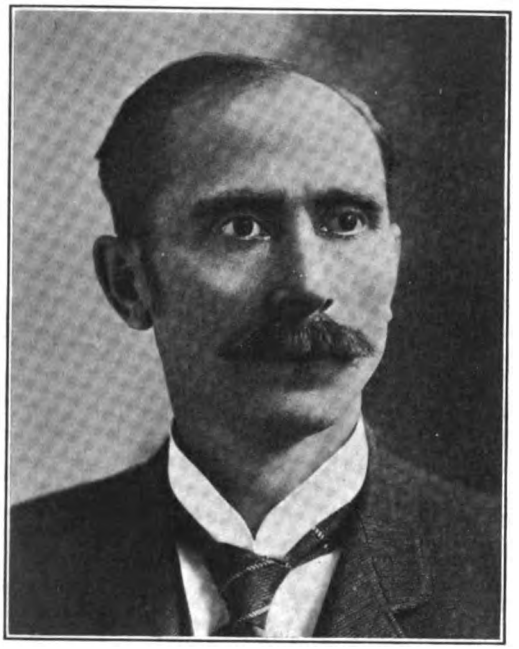
The United States Circuit Court for the Southern District of New York, on January 9th, granted the petition of the Government for a permanent injunction against certain retail lumbermen's associations operating in the Eastern states, their officers, directors, members and delegates, by which the defendants were practically enjoined from attempting to prevent any party or parties from buying or selling and transferring lumber in the District of Columbia. The effect of these associations has been to prevent wholesalers from supplying consumers direct by circulating official reports which contained the names of such wholesalers. The activities of the central bodies of this Association were confined to the dissemination of the information concerning the names of the offending wholesalers. There was no official requirement that they should refrain from dealing with any wholesalers whose names were on the list, but the court said "the record indicates that no such discipline is necessary."

In Ohio, the Circuit Court on December 30th handed down a decision in the case of the Government against the Lake Shore and Michigan Southern and certain other railroads, declaring the companies guilty of restraint of trade in violation of the Sherman Act. The decision makes inoperative the sale of 100 acres of coal land, together with the Sunday Creek Coal Company, together with the stock and other railroads by which the alleged monopoly was formed. The decision further recites that the joint owner-

Digitized by Google

ship of the Kanawha and Michigan and the Lake Shore and Michigan Southern be terminated.

It is announced that the Interstate Commerce Commission intends to follow up the indictments returned against the three railroads by the federal court jury in Buffalo, on January 14, with other prosecutions. Extensive rebating is charged in the indictments already presented. The defendants are the Erie, the Lehigh Valley and the New York Central and Hudson River. The maximum penalty, aggregating $3,240,000 is possible if the roads are convicted on every



SENATOR J. L. BRISTOW OF KANSAS.
A Representative of the Radical Wing of the United States Senate.

count. Fifty-one counts are contained in the indictment of the Erie, eleven in the indictment of the Lehigh Valley, and fifty in the indictment of the New York Central. The alleged methods of granting rebates were in the failure to collect damage charges, and leasing, for an income, some of the lands used for coal yards.

While the courts are active in enforcing the Sherman law, Congress continues to investigate in various lines. The Money Trust investigation has been continued during the month, without, however, eliciting anything with which the financial world was not already reasonably familiar. The investigations of the "shipping trust" are referred to on page 97.

BUSINESS BY REGULATION.

Senator Bristow, who represents as well as any member of Congress, the extreme radical attitude toward corporations, introduced, early in January in the Senate, a bill which is recognized as embodying the plan of the progressive Republicans for regulating corporations doing interstate business. The bill provides for an industrial commission which should have authority over industrial corporations engaged in interstate commerce, which is equivalent to the authority of the Interstate Commerce Commission over transportation companies. The power of the proposed commission would involve the investigation of the financial condition, business operation and management of companies subject to this jurisdiction and would contain a clause requiring all of them to bring their capital stock and debt down to a figure not more than 10 per cent greater than the fair and reasonable value of their property. Three years are allowed for the elimination of water from industrial capitalization. Standard fees for promoters are established.

Section 15 declares that any contract or combination in restraint of trade shall be presumed to be unreasonable. In order to remedy abuses which the investigations of the commission may disclose, authority is given for the appointment of receivers to take possession of the property and operate it in the stead of the officers of the company who may be subject to prosecution. Congress is given supreme authority over members of the commission who can be removed at any time.

The demand for extreme regulation has never gone further than the provisions of this bill. There is not the least likelihood that it will be enacted into law, but it stands as the expression of the deliberate judgment of a large section of the American people toward corporations.

GROWING DEMAND FOR COMMERCE COURT.

On January 15th, by a vote of 33 to 20, the Senate adopted an amendment to the legislative, executive and judicial appropriation bill, lengthening the life of the Commerce Court until June 30th, next. Under existing laws the court would come to an end on March 4th, but Congress having failed to transfer the jurisdiction of the

THE UNITED STATES COMMERCE COURT.

Reading from left to right the Judges are Martin A. Knapp, William H. Hunt, Julian W. Mack, John E. Carland, and Robert W. Archbald. Mr. Archbald is no longer a member of the Court.

court, and make arrangements for the disposal of cases then pending before it, the Senate decided to extend the life of the court to enable it to clear up its calendar. The bill will now go to a conference committee of the two Houses. While the Senate amendment gives the court but four months more of life, it will be left to President-elect Wilson to say whether the court shall be continued or not, and there is some reason to believe that the removal of Judge Archbald from that body and the arguments made by a number of attorneys interested in cases involving the interpretation of the interstate commerce law, will be effective in securing the continuance of what is a most useful tribunal. The opposition of the Commerce Court represents a concentration of the public hostility toward all courts, which found such abundant expression in the recent presidential campaign.

It is popularly assumed that the courts are controlled by the railroads, therefore, to concentrate railroad control upon a single court is to make that control omnipotent and to deprive the shipper of any opportunity before the law. The Commerce Court, moreover, it has been charged, has set itself up above the Interstate Commerce Commission, the administrative arm of the government, and has, in effect, constituted itself a second interstate commerce commission, thereby rendering the original commission largely impotent. It is, no doubt, this conviction, entertained by the members of the Interstate Commerce Commission, which has been largely responsible for the determined hostility shown by that body toward the Commerce Court.

It will, also, be remembered that a member of the Interstate Commerce Commission was directly responsible for bringing to the attention of representatives, the charges which have just led to the impeachment and conviction of Judge Archbald. Judge Archbald is now removed from the bench. The public desire for a victim has been satisfied, and the Supreme Court has itself materially curtailed the power which the Interstate Commerce Commission has assumed it could exercise under the Hepburn Act.

In a decision handed down on January 20th, the Supreme Court holds that the power lies in the federal courts to examine any record on which the Interstate Commerce Commission has made an order, affecting rates, and to determine, as a question of law, whether the evidence submitted to the Commission justified the order. This case was an appeal from a decision of the Commerce Court which issued an injunction restraining the enforcement of an order entered by the Interstate Commerce Commission annuling as "unfair, unreasonable and discriminatory" certain class rates made by the

Digitized by Google

Louisville and Nashville Railroad Company over its lines between Louisville and Pensacola. The Supreme Court reversed the judgment of the Commerce Court and held that the order of the Commission was proper, but in so doing it outlined and greatly restricted the powers of the Commission.

The case was begun by the railroad in the Circuit Court which refused to grant a temporary injunction restraining the order of the Commission. Later the case was transferred to the Commerce Court where the railroad's attorney submitted to that court a record of the proceedings before the Commission, upon complaint of the New Orleans Board of Trade, to prove that there was no evidence to show that the rates complained of were actually unjust. The Commerce Court, Judge Archbald writing the opinion, held that the Commission's order was void because there was no material evidence to sustain it.

The argument advanced on behalf of the Commission, before the Supreme Court, was that the courts had no authority to review the evidence upon which the Commission based its decision, since to grant this power of review would be to substitute the court for the Interstate Commerce Commission and to nullify the action of the Commission. This was one of the principal arguments used in Congress to secure the legislation of the Commerce Court out of existence. The Supreme Court absolutely rejected this argument, and Justice Lamar, who delivered the opinion, holds that the Hepburn law, instead of making the Interstate Commerce Commission's order "conclusive against a direct attack," expressly declared that they may be suspended or set aside by a court of competent jurisdiction. Whether the order deprives the carrier of a constitutional or statutory right; whether the hearing was adequate or fair or whether for any reason the order is contrary to law—these are all matters within the scope of the judicial power. The Court says:

"Under the statute the carrier retains the primary right to make rates, but if after hearing they are shown to be unreasonable the Commission may set them aside and require the substitution of just for unjust charges. The Commission's right to act depends on the existence of this fact and if there was no evidence shown that the rates were unreasonable there was no jurisdiction to make the order.

"In a case like the present, the court will not review the Commission's conclusions of fact by passing upon the credibility of witnesses or conflicts in testimony, but the legal effect of evidence is a question of law. A finding without evidence is beyond the power of the Commission. An order based thereon is contrary and must in the language of the statute be set aside by a court of competent jurisdiction.

"A finding without evidence is arbitrary and baseless and if the Government's contention is correct it would mean that the Commission had a power possessed by no other officer, administrative body or tribunal under the Government. It would mean that where rights depended upon facts, the Commission could disregard all rules of evidence and capriciously make findings by administrative act. Such authority, however beneficently exercised in one case, could be injuriously exerted in another, is inconsistent with rational justice and comes under the Constitution's condemnation of all arbitrary exercises of power."

With the reasons for opposing the Commerce Court largely removed, the advocates of the continuance of that tribunal have now a chance to get themselves heard. The Senate Committee on Appropriations on January 6th granted a hearing to representatives of shippers' organizations who desire to continue the Commerce Court. Mr. B. A. Dean, of Auburn, N. Y., chairman of the legislative committee of the National Hay Association, said:

"Assuming that a court intermediate to the Supreme Court is necessary, my association believes that, in the determination of questions concerning transportation law, one special tribunal is preferable to several tribunals dealing with numerous and varying questions; this on the grounds of expediency, uniformity and promptness of decision, and economy.

"Since there must, under the Constitution, be provision for court review at the instance of defendants before the Interstate Commerce Commission of questions of law decided by it, we believe the right to such review should be mutual for the litigants; in other words, that the complainant before the Interstate Commerce Commission should have the same right of court review as the defendant, and further that appropriate legislation should be enacted conferring such jurisdiction."

A stronger argument in favor of the continuance of the Court was made by John B. Daish, an attorney of Washington, representing various shipping organizations, who said:

"The continuance of the Commerce Court is justified on at least three grounds in addition to those formerly alleged. It decides questions very promptly and one is not compelled to wait until the time limit of the order of the Commission has expired; the jurisdiction and power of the court has now been practically marked out by the Supreme Court and there will be little occasion for future controversy in this behalf; the court is a court of experience and far more competent to decide upon the intricate questions of the law relating to carriers than would be the District Courts which have before them matters of law, equity, admiralty, patents and a world of other jurisdiction.

"Shippers are interested in continuing the court because they want confided to a special transportation tribunal versed in the intricacies of trans-

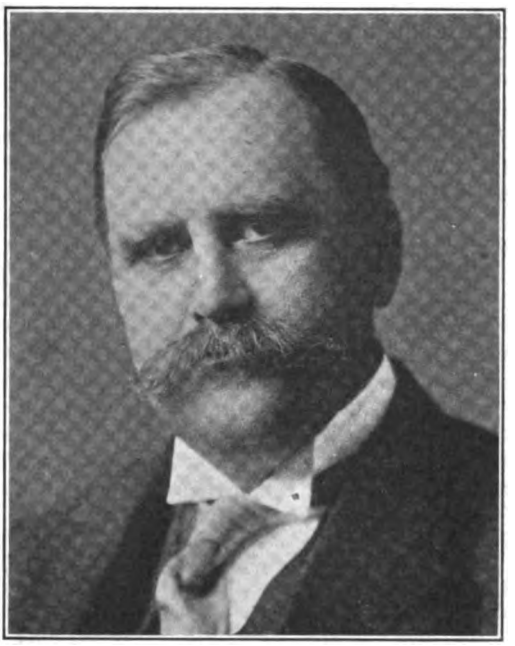
Digitized by Google

portation law, jurisdiction to review errors of law of the Commission when that body decides against them as well as when deciding for them. The present jurisdiction of the Commerce Court ought not be transferred to the Circuit Courts, because there is great difficulty in securing three judges under the expediting act. These judges are already busy and notwithstanding the expediting act, necessary delays result. Furthermore, where the same question is placed before different judges in different parts of the country the decisions lack uniformity."

Those who are familiar with the subject are unanimous in favoring the continuation of the Commerce Court. In the interpretation of such statutes as the interstate commerce law, which is national in scope, there is the greatest need of uniformity of decisions. Questions which concern the public in all parts of the United States should not be decided, one way in one district and another way in another district. Questions arising under the interstate commerce law, it must be remembered, go far beyond the rights or interests of individuals, affecting, on one hand, great railway systems with hundreds of thousands of creditors and stockholders, and on the other, the entire shipping and consuming public. The decisions of such questions must not only be uniform, but they must be accepted.

Under the late method of procedure, cases arising under the interstate commerce law were decided in the Circuit Courts, and by the present plan they will be heard in the District Courts, causing even a larger diffusion of interpretation and decision. The creation of the Commerce Court gave exclusive jurisdiction in cases arising under the interstate commerce law to one tribunal, thereby relieving the other federal courts from the burden of this class of litigation. When the court was organized in February, 1911, there was transferred to it, from the the various Circuit Courts, thirty-six cases which have not been tried, and which have been brought within the previous two years. Since that time fifty-two cases have been brought originally in the Commerce Court and the total number now pending in that court, remaining from the thirty-six previously brought, and adding the fifty-two brought within the past two years, is only eleven. From the standpoint of the shippers who are interested in the effective enforcement of the interstate commerce law, the concentration of judicial authority in one tribunal whose proceedings are attended with a greater measure of publicity than would be the case if this business were split up among the various District Courts, is a great advantage. The procedure is more extensive, a body has already been created which greatly accelerates the dispatch of business, and in spite of statements to the contrary, the weight of the Commerce Court decisions has been in favor of the shipper rather than the carrier.

The record of cases decided shows clearly that the Commerce Court has much more generally sustained the Interstate Commerce Commission than did the Circuit Court. The Commerce Court has granted preliminary injunctions in only seven cases and in several of these cases the Interstate Commerce Commission, itself, was divided.



GOVERNOR EUGENE FOSS OF MASSACHUSETTS.

GOVERNOR FOSS AND THE NEW ENGLAND RAILROADS.

In his third inaugural address, Governor Foss takes strong ground against what he styles the continuance of the railroad monopoly of Southern New England. He renews his recommendation for the dissolution of the Boston Railroad Holding Company, and calls attention to the fact that the leading issue of the last campaign was the control of the government of Massachusetts by the New Haven Railroad monopoly. He further calls attention to the decision of the United States Supreme Court in the Union Pacific and coal roads cases, which, he says, "makes it probable, and almost certain, that such an agreement of railroads to destroy or forestall competi-

Digitized by Google

tion, is a violation of the anti-trust act." The Governor continues that the combination between the New Haven and Hartford and the Boston and Maine is prohibited by federal law, that its benefits to the people of Massachusetts are wholly illusory, that the service rendered by the New Haven and Hartford is far from satisfactory, since the main energies of the management are devoted to perfecting and retaining their monopoly rather than to serving the public, and that if the state does not assert its right and authority to control its railroad corporation, to compel them to render good service and to keep within the law, there is danger that potential state control will be replaced by actual federal control, which will deprive the people of Massachusetts of the right to regulate their own transportation system. The Governor goes even further, and practically endorses government ownership and operation of the railroads.

Meanwhile, public hostility toward President Mellen and the New Haven seems to be abated. The opinion is rapidly gaining ground among the thinking people of New England, that the attacks upon the New Haven and Hartford have been inspired by interested parties. One of the most influential papers in New England, which has never been distinguished for its loyalty to corporation interests, is the Boston *Transcript*, and the saner view of the anti-railroad agitation is voiced by the *Transcript* as follows:

"Those New Englanders who are pressing for a congressional investigation of railroad conditions in this section will not lack for assistance from interests which are avowedly hostile to the New England States. For example, nothing would better suit the railroads whose shipping port is New York than to see a prolonged investigation by a committee of Congress of New England railroads, the effect of which would certainly halt plans for New England railroad extensions and for Boston's port development by alarming sources of credit upon which is dependent the financing of such projects. Let us not forget that the influence long exercised by New England in both houses of Congress, to the great advantage of this section, has resulted in powerful combinations against us in business as well as in politics.

"Any committee of Congress appointed to investigate the New England railroad system is certain to include one or more congressmen from the West and South. Many of these members have been elected on a platform pledging war upon the protected industries of New England. Such an investigation will give them the opportunity they have long sought to pillory New England before the public, and New England as a whole cannot but feel the force of the blows aimed by such hands at our railroad system. These political investigators may start on the trail of the railroads but they will soon be gunning for all New England. It is difficult to see what possible good can come to New England from such an investigation. It is very easy to see the dangerous probabilities it threatens.

"If there is to be another investigation to determine how the deficiencies in our railroad system, from which the traveling public is daily, and in many instances justly complaining, are to be remedied, a conference of the New England governors could plan an investigation by New England experts in the interest of the New England States. The assistance of the Federal Government can be obtained through the Interstate Commerce Commission. The sooner these six States come to a fuller recognition of their community of interests the sooner will they co-operate to meet the outside competition that confronts them on every side by union from within. The new year would be a good time to call such a conference. Who will take the initiative?"

Some of the friends of the New Haven go so far as to say that the attacks upon the company have been due to the aggressive policy pursued by the New Haven in developing the port of Boston. What originally aroused the apprehension of these interests, it is declared, was the powers conferred upon the directors of the port of Boston to spend millions of dollars for the development of the water front, and the aggressive manner in which the directors of the port proceeded to carry out their duties.

Attention is also being directed to the benefit which the Boston and Maine has gained from the control by the New Haven. This view of the matter is voiced in an address by William J. Hobbs, vice-president of the Boston and Maine Railroad, at Malden, Mass., as follows:

"I have no patience with those men who, either through ignorance or malice, are maligning and persecuting Mr. Mellen, a man who by reason of his remarkable ability as a manager of railroads in New England, is in a class by himself, and who in my judgment stands head and shoulders over his associates.

"He has expended for improvements made and in progress in the short time he has been in charge, about $25,000,000 against $40,000,000 expended during the previous eight years.

"Great shops are under way at Billerica for repair of engines and cars at a cost of $2,500,000. New yards are being completed at Mechanicville, the great interchanging point with the Delaware and Hudson Railroad, which will cost more than $700,000 more and which, when completed, will relieve all congestion of freight traffic at that point. At Newport, Vt., where connection is made with the Canadian Pacific Railroad, extensive yards are being planned, expected to cost more than $300,000. Engine houses are being enlarged, water supplies and coaling plants improved, bridges rebuilt and a multitude of other improvements and enlargements made, and so the work goes on. Give him a chance, and withhold judgment until he approaches completion of his plans."

On the other hand, the people of New

Digitized by Google

England feel that they have a real girevance against the Mellen regime, which has, as yet, been unable to bring up the standard of operating efficiency to the desired level. There is also a deep rooted antipathy to the domination of the entire transportation system of New England, land and water, benevolent though this despotism may be. If centralized control of transportation had by this time realized the great benefit which had been urged for it, and which, indeed, it may be conceded will eventually be derived from it, this antipathy to what is termed "one man domination" might not have been so effective. Mr. Mellen's plans have been magnificent. They have been inspired by loyalty to the interests of New England; they have not, however, as yet so clearly demonstrated their success as to win for their author that measure of popular support which is essential to their continuance.

That the administration of the New Haven realizes the necessity of modifying its plans in deference to public opinion, is seen in the statement by President Mellen, that unless the steamship holdings of the New Haven are authorized by the Interstate Commerce Commission, the company will sell these holdings in 1914. This sale, he stated, will be a bonafide transaction, by which the company will rid itself of every piece of steamship property except that used directly in connection with the railroad business. The steamship lines will still be operated in cooperation with the railroad, although independent of it.

SHIPPING TRUST INVESTIGATION.

This announcement of a surrender by the New Haven over its long standing control of New England coastwise commerce, is simultaneous with the publication of the report by Luther Conant, Jr., Commissioner of Corporations, which deals with the subject of railroad companies and steamship combinations. In practically all the coast waters of the country, the Commissioner says, railroad or steamship consolidation dominates water transportation. This control is especially striking on the Atlantic and Gulf coasts and on the Great Lakes.

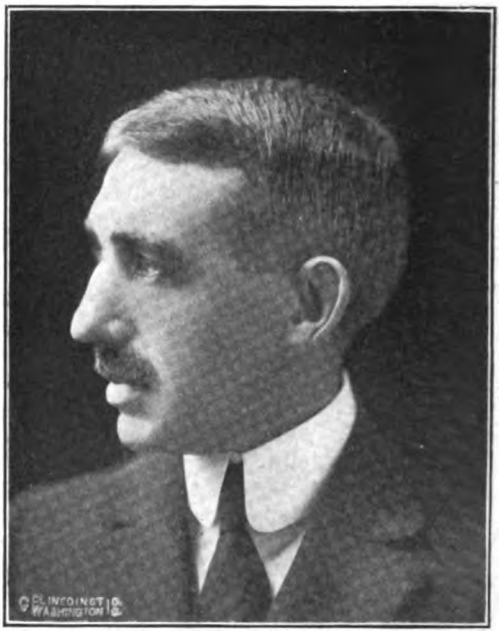
"So far as the eastern part of the country is concerned," says Mr. Conant, "water lines have to a large extent become auxiliaries or subsidiaries of railroads. The Interstate Commerce Commission has by recent legislation secured a considerable increase in jurisdiction over joint rail-and-water traffic, particularly with respect to the establishment of joint rail-and-water rates and the equitable division of such rates between the carriers. If there is to be any successful attempt to increase competition in domestic water traffic, it seems certain that such joint-rate arrangements should be far more generally established than at present. Since joint through rates are almost invariably less than the sum of the local rates, a steamship line deprived of the advantage of a joint-rate arrangement with railroads on an equitable basis is practically unable to compete with a rival enjoying it."

The report says that twenty railroads control steam vessels and barges of 810,000 gross tonnage, engaged exclusively in domestic trade. Of these the tonnage of the New Haven is the largest, about 200,000 gross tons. The Union Pacific-Southern Pacific combination has more than 150,000 gross tons, then follow the Pennsylvania with 77,000, the New York Central with 50,000, and the Central of Georgia with 40,000. On the Great Lakes important passenger and package freight lines, it is declared, are owned by railroads. Several of the principal lake fleets, handling ore, coal and lumber, are under the control of large corporations. The Commissioner points out that there is competition on both coasts. On the Atlantic Coast, the Atlantic, Gulf and West Indies Steamship Lines, and the Eastern Steamship corporation, operate independently of the railroads; on the Great Lakes, in the local package freight traffic, there are a large number of independent water carriers, and on the Pacific Coast the Commissioner found several independent steamship lines. The Commissioner also calls attention to the fact that the railroads have driven out the steamship lines formerly operating on the Mississippi,—a fact explained by their lower rates and superior service, and that they control about 90 per cent of the private canals still in operation.

In line with the claims made by the Commissioner of Corporations are the revelations as yet confined to the prosecution before the House Merchant Marine Committee, which is investigating the subject of shipping combines. A large number of witnesses have testified that the ocean is in the grip of a monopoly. As one witness put it "the ocean is laid out like a set of blocks over the angles of which foreign owned vessels sail in well regulated streams," slighting the commerce of this country in favor of the country to which they belong. The consensus of testimony, thus far taken, has charged

Digitized by Google

U. S. Representative Alexander
Chairman of the House Committee Investigating the So-called "Shipping Trust."



Luther Conant, Jr.,
Commissioner of Corporations.

that the plan by which this alleged monopoly has been established and maintained, is a system of discriminations and rebates, effected by means of pools, conferences and understandings between "regular shipping lines," by which they divide up the shipping trade of Europe and the United States with the Orient and South America, practically excluding all competition which they annihilate, whenever attempted, by an ingenious system of rebates.

One witness, representing the Pan American Mail Line, said that coffee shippers of Brazil are afraid to patronize an American line, lest they forfeit their contract with the conference lines, and lose their rebate, and that American exporters were charged from 40 to 50 per cent more to South America than are European lines. Mr. Joseph Purcell, of Hard and Rand, of New York, one of the largest importers of Brazilian coffee to the United States, testified that for shipping its coffee exclusively by the Lampert and Holt Line, the Price Line and the Hamburg-South Amerika Line, this concern was given a maximum rebate of 10 per cent. A variety of similar testimony, affecting not only the foreign trade, but the coastwise traffic, was brought out before the Committee.

In defense of the system of conference syndicates, it was urged that these arrangements have greatly helped commerce because they have put the steamship business on a profitable basis. Mr. Paul Gottheil, president of New York company of steamship agents and brokers, claimed that subtracting the depreciation on the cost of the ships at 5 per cent annually, out of $50,000,000 worth of vessels, none had in three years cleared on the average of over 4 per cent. Without a conference agreement in the South African trade, for example, he claimed, every fleet operating between New York and South Africa would have to number at least 25 ships, to make one call a month at ports and even would have to send practically every ship 7,000 miles in ballast back to New York because of a lack of cargo.

In spite of the large amount of testimony regarding certain features of which, by the way, witnesses who have testified in behalf of the present system, have confirmed, it is by no means certain that the so-called shipping trust is injurious to American commerce, that its profits are abnormal, or that there is any method by which these agreements can be broken up. The real reasons for the predominance of European countries in the trade of South America, lie far deeper than the surface of ocean transportation. This advantage of the European exporter is primarily based upon a more active and careful cultivation of foreign markets. There is no doubt that foreign steamship lines have favored their

Digitized by Google

own exporters wherever they could do so, mainly, however, in granting them the advantage of regular sailings. In this work, in behalf of the commerce of their respective countries, foreign steamship lines have been powerfully assisted by the subsidy policies of their respective governments. There is much reason to doubt that competition in the shipping industry, a business which, left to its own devices, is far from profitable, can be restored by any legislation, or that even if it were restored, American exporters would gain any material advantage.

COASTWISE SHIPPING AND THE PANAMA CANAL.

The subject of the the provision in the control of coastwise commerce is intimately bound up with the larger question of the Panama Canal. Indeed, it is the provision in the Panama Canal bill exempting coastwise vessels from payment of tolls which is the ground on which Great Britain has based her opposition to the treaty. The exemption of American coastwise shipping, which already enjoys a monopoly of this traffic, is declared by Great Britain to be a violation of the terms of the Hay-Pauncefote treaty under which the canal was to be open on equal terms to the shippers of all nations. A strong protest has been made in and out of Congress, a protest ably voiced in a recent speech by Senator Root, against the United States' insistence upon her construction of the treaty and in favor of leaving the matters of difference between the two nations to the decision of The Hague tribunal. President Taft has also declared himself as unequivocally in favor of the arbitration of the question of the Canal tolls in event of the pending negotiations between the two countries failing to bring about a settlement.

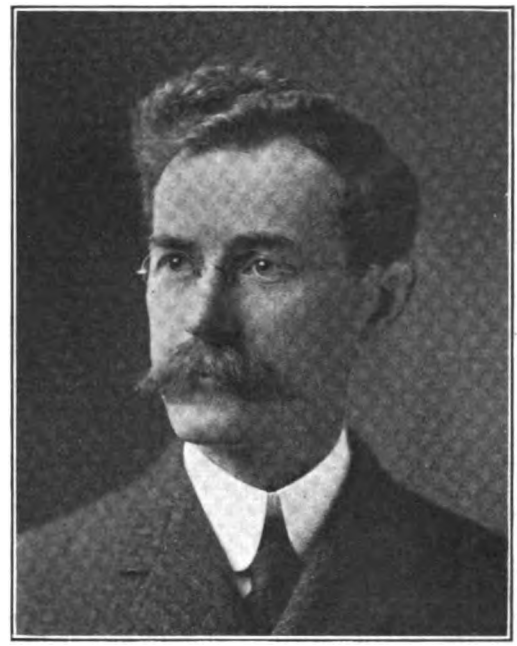
A new view of this question, which is based upon economical rather than ethical grounds, was presented by Professor Emory R. Johnson, Special Commissioner for the Panama Canal, on "Traffic and Tolls," before the Western Society of Engineers, in which he strongly declared against the "unwisdom of toll exemption for coastwise shipping." Professor Johnson, in this address, raises four questions, and answers them in order. The questions are as follows:

"Do you coastwise carriers need to be given a subsidy of nearly $20,000,000 during the next ten years?

"Will the general public—shippers and consumers—be benefited by this subsidy, i. e., will freight rates by coastwise lines or by rail lines be lower?

"Is this the best method of using public funds to aid the merchant marine?

"Are tolls upon all ships needed to make the canal self-supporting and not a burden upon the general taxpayers?"



EMORY R. JOHNSON,

Special United States Commissioner on Panama Traffic and Tolls, and Professor of Transportation and Commerce, University of Pennsylvania.

The answers are as follows:

"1. It must be evident to every impartial student of the question that it is not necessary to relieve coastwise shipping of canal tolls as long as foreign built ships are not allowed to engage in the domestic commerce of the United States. American ship owners have a monopoly of the coastwise trade. Our coastwise marine is now given sufficient aid and protection by our navigation laws.

"2. The sentiment in Congress and elsewhere in favor of relieving the coastwise shipping from the payment of Panama tolls seems to be due largely to the belief that if tolls are collected from the steamship lines the freight rates which they charge and the rates of the transcontinental railroads will be higher by the amount of the tolls, and the public will thus pay more in added freight rates than it will gain in tolls received. This argument, however, assumes an improbable adjustment of rail and water rates. The rates of the steamship lines and the railroads will not be higher if Panama tolls are collected from the coastwise line.

"3. The exemption of American coastwise shipping from the payment of Panama tolls is a poor kind of subsidy to our merchant marine. The money will go to our shipping that needs no aid, and not to our vessels that require assistance. The experience of Japan, Germany and even of Great Britain shows that the only effective ship subsidies are those paid to strong lines operated over routes deemed important to the Government

Digitized by Google

granting the subsidy. To aid our merchant marine in such a way as to produce results, strong lines must be selected or created and given such support as they require to enable them to compete successfully with foreign steamship companies and grow stronger year by year; must concentrate its aid and strengthen the strong lines assisted. It has been suggested that it would be wise for the United States to pay back the Panama tolls collected from the owners of American ships engaged in our foreign trade through the Panama Canal. Such a subsidy, however, would be so small and so thinly distributed as to be ineffective; moreover, the repayment to ship owners of the Panama tolls collected from them would invite similar action by other nations to overcome the effect of our action. Such a subsidy would be one suggesting retaliatory action.

"The tolls upon merchant vessels have been fixed by the President at $1.20 per net ton. It is thus possible that the revenues derived from the canal during the early years of its operation might average about $12,600,000 per annum, if all vessels, American and foreign, were to pay tolls. If the coastwise shipping is exempted from tolls the initial receipts from the canal will amount to less than $11,500,000 during the early years of operation. By 1925 the total traffic of 17,000,000 net tons might, if the rate of tolls were maintained at $1.20 per ton, yield a possible revenue of $20,400,000 if all ships, American and foreign, were required to pay the canal levies. In all probability, however, the rate of tolls will have been reduced to $1 per net ton by 1925, thus reducing the possible aggregate revenue to $17,000,000. The coastwise shipping of the United States in 1925 will doubtless contribute at least 2,000,000 of the probable 17,000,000 net tons of aggregate traffic. Thus, if the coastwise shipping does not pay tolls in 1925 and the rate of tolls is $1 per net ton, the probable revenue of the Panama Canal will then be $15,000,000 a year, or somewhat less than the estimated annual outlays for operation, zone sanitation, government, the Panama annuity and the interest on the amount invested in the canal.

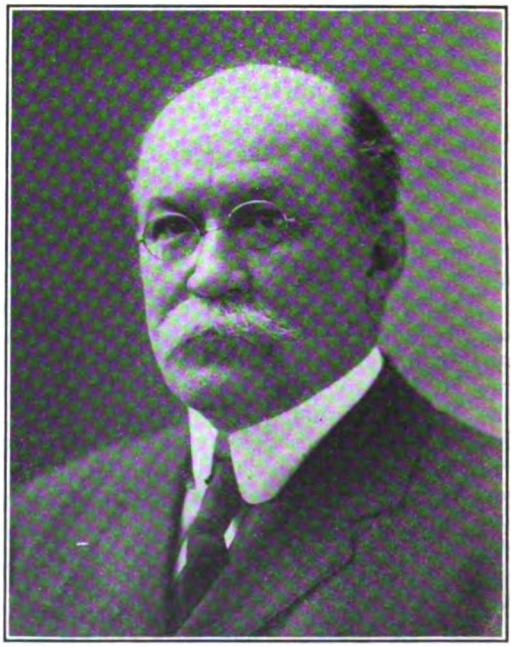
"Those who derive immediate benefit from the use of the Panama Canal may properly return to the Government a portion of the profits secured from using the canal, provided this policy can be followed out without burdening commerce. It should be the policy of the United States to apply business principles to the management of the Panama Canal and to prevent its being a continuing burden upon the general Treasury and upon the taxpayers of the United States."

Professor Johnson has stated what, in our opinion, is the strongest objection to the policy of exempting coastwise vessels from the payment of tolls. It is purely a business proposition. The coastwise traffic is now confined to American vessels and the remission of tolls would be equivalent to a large subsidy, added to the advantage of their present monopoly.

That Congress is responsive to the demand that public money should be expended in developing water transportation is seen in the annual appropriation bill brought in by the House Committee of Rivers and Harbors which provides $40,800,000. The largest single appropriation in the bill provides $6,000,000 for the improvement of the Mississippi River from the head of the passes to the mouth of the Ohio; $1,000,000 from the mouth of the Ohio to the mouth of the Mississippi, and $1,500,000 from the mouth of the Missouri to Minneapolis, and $185,000 from St. Paul to Minneapolis. Large amounts are also provided for the work on the Missouri, the Ohio, the Delaware and certain rivers in the South.

THE PRODUCER, THE RAILROAD AND THE CONSUMER.

President W. W. Finley, of the Southern Railway Company, at a meeting of agricultural societies held at Baltimore recently, discussed in some detail the relations between the producer, the railroad and the consumer. President Finley pointed out that an increase in railway transportation charges had not been a factor in the increased cost of living, a fact shown by the stationary railway rates. Furthermore, railway freight charges play but a small part in making up the final price to the consumer. As the Secretary of Agriculture in his report for 1910 pointed out in the case of milk, the farmer receives 50 per cent of the retail price, the railroads 7 per cent, and 43 per cent goes to the retailer. In the case of butter the freight charge is one-half of 1



W. W. FINLEY,
PRESIDENT OF THE SOUTHERN RAILWAY.

Digitized by Google

per cent of the consumer's price; eggs six-tenths of 1 per cent; potatoes 7.4 per cent. The main concern of the consumer with the railroads is the facilities which they can furnish. The importance of transportation is constantly increasing with the growing diversification of industry in all parts of the country. So far as agriculture is concerned, this diversification has taken the form of an increase in the production of perishable products, such as fruit. If the facilities of the carrier are not sufficient for the transportation of these products a large amount must be wasted. As President Finley states:

"In a growing country, such as ours, with increasing exchanges of the products of agriculture, manufacturing, and mining, the demands upon the railways for additional tracks, terminals, cars, and motive power are constantly growing. The situation is one which requires that, in ordinary times, the railways shall have an unused margin of facilities in order that they may be able successfully to meet sudden increases in the demand for their service. The provision of such facilities can be assured only if the railways are prosperous and if their earnings over the costs of operation are sufficient to attract capital to railway investments."

DISSOLVING THE HARRIMAN MERGER.

The plan for dissolving the Union Pacific-Southern Pacific merger is meeting with obstacles, which were not, however, entirely unlooked for. The first plan submitted to the Supreme Court involved either the distribution or the sale of the Southern Pacific stock among the stockholders of the Union Pacific. The Supreme Court, speaking through Justice Day, refused to permit this transaction, on the ground that it would, in effect, "transfer the stock from the Oregon Short Line Company, which now holds it for the Union Pacific, to the stockholders who own and control the latter company. The court is of opinion that this distribution or sale cannot be ordered. "The ultimate determination of the affairs of the corporation rests with its stockholders, and arises from their power to choose the governing board of directors. After such distribution as is now proposed, the stockholders of the Union Pacific Company may dominate and control not only the Union Pacific Company, but the Southern Pacific Company as well."

Negotiations have continued between the department of Justice and the officers of the Union Pacific, and it is expected that a plan will soon be announced whereby the Union Pacific may acquire from the Southern Pacific, either by purchase or by exchange of Southern Pacific stock, which it holds, the entire stock of the Central Pacific, of which there is $17,200,000 of preferred and $67,275,000 of common. After this transfer had been made the Union Pacific and Southern Pacific systems would be entirely separated. With the Union Pacific and its eastern connections extending from the Missouri River to the Pacific Coast over the present Central Pacific lines, and the Southern Pacific confined to the route from New Orleans through Texas to Southern California and San Francisco, the two transcontinental systems would be independent. The Southern Pacific could reduce its capitalization by the amount of stock thus obtained, and the transaction would leave the Union Pacific with less than $60,000,000 of Southern Pacific stock, which could be sold to Union Pacific shareholders at cost, about $75 per share. There is reason to believe that the disposition of so small a percentage of Southern Pacific stock would not be prohibited by the court. Meanwhile, the first direct effect of the decision is seen in the retirement from the Southern Pacific board of all directors representing the Union Pacific interests.

Instructions for the Guidance and Protection of Employes.—The Pennsylvania Railroad has begun the distribution of 50,000 copies of a book of "Don'ts" for employes working on trains, tracks and in shops.

That there is a large foreign element now employed on the Pennsylvania is taken from the fact that the "Don't" book, or "Instructions for the Guidance and Protection of Employes," as the company calls it, is printed in Italian and Polish, in addition to English.

Some idea of the small details the Pennsylvania is watching can be seen from the contents of the "Don't" book:

"Don't step in front of or attempt to adjust couplers on moving cars, nor stand with back to cars coupled to engine."

"Don't stand between cars when coupling."

"Don't step on footboards on pilot or tender when engine is approaching you."

"Don't go under a train to make repairs or adjustments, until full protection has been secured."

"Don't place coal on tenders in such a manner that it may fall off."

"Don't think because a wire is dangling it is harmless. If necessary to remove it, use two sticks or boards."

"Don't wear gloves or loose clothes when working with machinery or tools."

"Don't use tools in bad order."

"Don't touch the third rail with person or tools. If necessary to remove an object therefrom, use a 'dry' wooden stick."

Contemporary Opinion

The Case for the Railroads.

IN an editorial, under the above head, the "New York Journal of Commerce" discusses the causes which led to the formation of regulative bodies, both State and national, among which it makes prominent mention of the investigation of a committee of the Chamber of Commerce and Board of Trade and Transportation in New York, in 1879, which apparently showed excessive capitalization of certain roads operating out of New York. Of the influence of the results of this investigation, the editorial says:

"The report of this committee paved the way to the creation of the New York State Railway Commission and was a powerful influence in bringing about the enactment of the Interstate Commerce law of 1887. But railroad managers were slow to recognize the necessity of consulting the general interests of the public in the conduct of the business under their charge. As Mr. Logan H. McPherson puts the case in an article in defense of the railways in the 'North American Review': 'The people came to distrust the railways; the railways came to distrust the people.' But by and by the railroad managers began to realize that the will of the people in this country is supreme and that, however misguided they might think it, the only way to modify its dictates was by a process of education and candid discussion. The enactment of the Mann-Elkins bill in 1910 compelled the railway presidents to adopt this point of view, and from that time on there has been, according to Mr. McPherson, a new attitude toward the public. The Bureau of Railway Economics is one outcome of this desire to place the essential facts of railway management and development in the United States before the people. That is to say, the bureau is continuously engaged in a line of studies designed to bring out information as to the broader economic relations of the railways. For example, the fact has been made clear that the capital value of railway property in the United States is increasing less than half as fast as the capital values of either the agricultural or manufacturing industries, and that the percentage of net return on capital in manufactures is over twice as high as that of the railways."

The editorial then takes up the recent address of J. J. Hill at the annual dinner of the Railway Business Association in which it was shown that during the first seven months of 1912 operating revenues increased 3.3 per cent. per mile as compared with the same period in 1911, but operating expenses increased 4.9 per cent., and net operating revenue decreased .5 per cent. The editorial then continues:

"There has been a distinct impairment of the ability of railroads to raise capital for improvements, partly because of increased competition in the money market, but mainly from the lowering of credit due to the decreased earning power and the increased expenses of the railroads themselves. On all this Mr. Hill bases his argument for a more generous treatment of the railroads, so that they may be able to provide the equipment and the terminal facilities which are imperatively needed for the efficient conduct of their business. It is obvious that when the railroad yards are filled with cars that cannot be moved the railroad loses a portion of its earnings, but the business man also loses a larger share of his trade and the workingman his employment. Hence Mr. Hill pleads that it is the duty of every business organization, of every business man, of capital interested in safe investment and labor interested in sure and remunerative employment, to help to swing the country into line behind the only policy that can help both the railroads and the people. That is an argument for which happily there is a more sympathetic public than there was a generation ago."

An English View of American Railway Regulation.

THERE has been some caustic criticism recently in the English press regarding the constant interference American railroads are being subjected to by governmental authorities in their efforts to instruct railway officials how to manage and run the properties intrusted to their care.

The "New York Times Annualist" states that surprise is being felt in that country at the length to which State interference with individual liberty has been carried, when not only must the corporations part, as in the case of the dissolution of the Harriman Merger, but they must arrange their means of parting to please the administration. A recent statement by the chairman of an English railway is quoted as follows:

"If I were an American Railroad Director, I should now be sure that there was only one way out of the intolerable state of the present relations between Federal Government and railroads, and that was the swift and speedy consummation of State ownership. How can railroads prosper under the partial control of a hostile body?"

Shippers and Cars.

FORTUNATELY the railroads, during the past few months of exceptionally heavy traffic, have, in the main, been able to handle the situation in a satisfactory manner, and with much less delay than has occurred during previous years. In commenting on the shippers' responsibility in assisting the railways to keep cars moving, the "Financial American" has the following to say:

"We have been given many excuses for car shortages on our railroads, but that furnished by the Public Service Commission for the Second District, New York, is certainly novel. It says that certain shippers are largely to blame for the inconvenience resulting to those desiring cars, through a rather brazen custom of keeping the cars containing consignments to them for several days upon sidings and using them as free warehouses. During the month of November, upon railroads under the commission's jurisdiction, it reports not less than 122 cases wherein freight cars were detained for periods

Digitized by Google

varying from 5 to 25 days in the manner referred to. This is an inexcusable and wanton breach, and the commission is quite justified in calling public attention to it. It is a grave offence against the rights of other shippers and a practice which tends to put the railroads in a bad light with the public. When those who demand cars for shipping purposes fail to obtain them, they feel naturally resentful against the railroads, and set down their inability to furnish the cars to a railroad indifference to the rights of the public or to negligent management. Frequently complaints are made to the State commissions and to the Interstate Commerce Commission on the car shortage score, in nearly all of which it appears, or is made to appear, the railroads are to blame. It is only when the concrete illustration given us herein is furnished that the public learns the railroad is not wholly at fault. Our commission for the second district has adopted an effective way to deal with the offenders it has unearthed: it published their names in its report. If other commissions would adopt a similar course, perhaps the pernicious 'free warehouse' practice would be abolished."

Accident Publicity.

DISCUSSING the question of increased safety in railroad transportation, Julius Kruttschnitt, the new chairman of the Southern Pacific says:

"I think we should abolish the use of the word 'unexplained' in connection with accidents, the cause of and individual responsibility for everyone of which, whether serious or trivial, should be determined, sparing neither talent, time nor money to do so. The results should be frankly and freely given to the public, to enable it to form an intelligent opinion, the weight of which will be irresistible in bringing about the necessary corrections, which should be left to the railroads themselves, unhampered by hasty and inconsiderate legislation, too often inspired or influenced by promoters of patented devices.

"If the policy of investigating accidents fairly and thoroughly and locating individual responsibility therefor, making the results public, is established, the public authorities will have performed a great service to their constituents. Enlisting the co-operation of employes in promoting safety is of the greatest importance.

The Tie Problem.

THE question of tie economy is receiving increasing attention from the carriers on account of the growing scarcity of timber and the resultant higher prices. Tie preservation is becoming a necessity as well as an economy and unless a suitable substitute is found for the wooden tie and unless the roads generally adopt such methods, is likely to eventually become enforced through regulation. By the rapidity with which preservation plants are being established, however, no action of this kind appears probable. Some interesting comments on the tie situation in general, appear in the "Wall Street Journal" of January 8th, as follows:

"So much stress is laid upon the importance of the rail in the creation and up-keep of railroads that the more modest but indispensable tie, is little thought of unless grave accident calls attention to its fundamental position in construction. Ties represent perhaps the largest return in proportion to investment, of any part of the equipment of a railroad. Cheap in themselves, their aggregate cost is great. Some idea of this is given by figures showing what ties really mean in the bills of the railroads. Minimum renewals per annum, varying all the way from the high maintenance of the standard roads to the perfecting of poor trackage, represent at the least 75,000,000 ties. The 750,000,000 railroad ties now in use have an initial value of $300,000,000.

"Problems presented by the question of ties are awakening expert attention. The time is not far distant when lumber supply will cease to offer enough material for ties in addition to increasing demands from many other industries. Tie-substitutes are being sought. Steel has not yet given satisfactory results. Opinion leans to concrete ties. Without allowing for any growth of our railroads, the cost of replacement of wooden ties on the railroad tracks of the country, would mean a sum of more than $1,500,000,000. This takes inadequate account of the developments of the future. Nor does it reckon with the electric and trolley systems which are slowly, or rapidly, starting to equal in extent the 250,000 miles of railroad track in the United States.

"There is another consideration in the tie question. Between 60,000,000 and 75,000,000 ties are burned each year, the railroads having found it practically impossible for various reasons to sell or to give away the discarded ties. This destruction represents about 2,000,000 cords of wood, whose value is from $7,000,000 to $8,000,000. It would seem that this might be saved 'and given to the poor.' But the poor will not take it, as attempted distribution has shown."

Judicial Recall of a Judge.

PRESS editorials upon the conviction of Judge Robert W. Archbald, of the United States Commerce Court by the United States Senate are practically a unit in their endorsement of its wisdom and justice. While extenuating circumstances are pleaded in some particulars and in some quarters, the finding contained in the statement of Senator Root that Judge Archbald "used the power and influence of his office as a judge of the Court of Commerce to secure favors of money value for himself and friends from railroad companies, some of which were litigants in his court and all of which were under the regulation of the Interstate Commerce Commission, subject to the review of the Court of Commerce" appears to have generally convinced the press that his usefulness as a judge has been ended.

The chief source of satisfaction to many editorial writers, however, rests in the assurance, through the conviction, of the ability of present constitutional laws to adapt themselves to the necessity of recalling judges, when such action became necessary. As a leading New York daily remarks:

"The highest significance of this proceeding and its result lies in the illustration it affords of the solemn way in which charges against judges should be regarded and the deliberate manner in which they should be treated in de-

Digitized by Google

termining the question whether their dereliction is one that would justify their removal from the bench and stamping an indelible stigma upon their name and reputation. It was in impressive contrast with the unseemly exhibition that might be made if judges could be 'recalled' by a popular vote whenever they rendered decisions which were displeasing to the sentiment prevailing at the time. In nearly all the States there are constitutional provisions for the removal of judges which afford adequate methods of determining whether there are reasons which justify it, and it would be an evil day when formal and impressive proceedings should be superseded by an exciting campaign for a 'recall.'"

American Waterways.

IN a recent issue of the "London Economist" one Lawrence Hamilton, calls attention to the necessity in Canada for an artificial waterway in order that the Dominion may not be behind the times in new aquatic transportation projects. Mr. Hamilton has made the interesting, not to say amazing, discovery that a great internal waterway 2,700 miles long, connecting New York with New Orleans, is being constructed at a cost of £33,000,000 or more.

Mr. W. M. Acworth, the eminent English economist, in a letter noticing the startling statements and some of the opinions of the economist's correspondent writes to that journal:

(1) What is and where is "the great internal waterway, 2,700 miles long, connecting New York with New Orleans, approaching completion?" And how comes it that hitherto the American technical Press has combined with the British public to "ignore" it?

(2) Why is this waterway 2,700 miles long, seeing that from New York to New Orleans is only about 1,200 miles, and even round by Pittsburgh can hardly be more than 1,300?

(3) What will be the maximum tonnage of vessels which will be able to use the new internal waterway throughout its entire length?

(4) Why does Dr. Hamilton call the American freight rates "exorbitant," seeing that they only return a very low rate of interest on the construction capital, and that they are certainly the lowest in the world—roughly speaking, one-half the rates charged on the railways of the two countries, France and Germany, which have done most in the development of artificial waterways?

(5) As for Dr. Hamilton's projected Canadian waterways, can he tell us whether anybody but himself projects it; how it will get over the passes of the Rockies; what freight rates it would need to charge in order to pay; and for how many months the Canadian climate would permit its operation?

(6) Lastly, I would venture to ask Dr. Hamilton a question which I have publicly asked advocates of internal waterways for a good many years, without even so much as obtaining an answer: Can he tell me where to find any independent scientific evidence that an artificial internal waterway is ever under any circumstances a more economical method of transportation than a railway? Evidence of this class, so far as I have been able to study it—for Germany, for instance, in Uhlrich's "Wasserstrassen und Staffel Tarife"; for France, in Colson's "Transports et Tarifs" (confirmed by the Report of the Assistant Commissioner who investigated French waterways for the recent Royal Commission and Canals); for American in two very recent books, Moulton's "Waterways versus Railways," and Shelton's "Lakes-to-the-Gulf Deep Waterways"—is unanimous to the contrary.

Government Ownership in Japan.

IN a recent issue of Harper's Weekly, George R. Bedinger, discusses the nationalization of railways in Japan, which began in 1906, and which, in his opinion, has met with indifferent success. He has been a close observer of the results obtained which he criticises for the following reasons:

First.—No bureau of government officials will run the railroads on as sound business principles, with a view of getting business by carrying out the wishes of the public, as will be done by a private company or corporation that has this one matter as its excuse for existence.

Second.—A spirit of officialdom enters the service of government owned lines, and such spirit detracts from real good business efficiency. He points out that when a railway is a part of an august central power, it is removed from healthy criticism as well as from free competition.

Third.—When the government owns a great empire-wide interest like railways, it is likely that certain members of the government will be tempted to use that interest as a means of giving places to persons who in some way they wish to serve.

In conclusion, Mr. Bedinger says:

"Thus, after all, the question of the success or failure of Japanese railway nationalization resolves itself into a matter of efficiency. If after nationalization the railways have been run far better than before and given the people much better service, well and good. But from what I have been able to see and learn of the matter during a residence in Japan during the last eleven years I cannot see that this has been the case. The extension and improvement of means of transportation in Japan have not gone ahead as rapidly as they should have. This is due to growing official red-tapism on the part of the government and the actual blocking of private enterprises for rapid transit, such as suburban tramways, because they would prove local competitors to the state roads."

Public Rights and Labor Disputes.

PRESIDENT W. C. BROWN, of the New York Central, in a recent interview declared himself as being in thorough accord with the suggestion of the Arbitration Board which recently presented its report in the dispute between the locomotive engineers of the Eastern Railroad, recommending permanent arbitration of all public service labor troubles and the recognition of the public as one of the three groups interested in the dispute. Mr. Brown said that he would like to see the matter taken up by Congress and expressed in a statute clearly defining the rights of the three parties to all such controversies.

Railway Mileage.

THE "New York Commercial" comments editorially on the fact that the total miles of railroad constructed last year amounted to only about one per cent. of the total mileage of the country. In view of the vast areas still unserved by railway facilities it sees an ominous significance in this abnormal lack of development. In seeking a reason it finds that "money is dear and hard to get for transportation enterprise except it seems clearly a definite purpose in establishing feeders to well established routes or is used to perfect the facilities and methods of lines which carry a great good will asset in the business already builded and assured. Through the newer and sparsely populated regions, just beginning to develop potential wealth and civilization only the lure of building the great steel highways of traffic has shrunk to a negligible factor.

"Perhaps the principal drawback to new railroad building, aside from the fact that so much capital is going into electric trolley lines is the high rate of interest that roads are compelled to pay for money raised on short term notes. The speculative element is essentially killed, and the reduction of new ventures has been attenuated to nothing. Capitalists both in this country and abroad can find so many methods of investment that imply a minimum of risk and a more rational promise of quick and easy profit.

"But railroad building cannot continue in this parlous condition without a recognition of serious damage to the general prosperity of the whole nation. Instantly that this sense becomes acute and widely diffused, there will be a reaction. But railroads will be built from the outset on a much more substantial and authentic basis of estimate. Those that are built will be constructed with ends in view which will prevent them from passing through a dozen transmutations and reorganizations before they finally attain a stable status."

Railroad Casualties.

THE Philadelphia News Bureau in discussing casualties on American railroads, states that the appalling number of such accidents excites wide discussion when the figures are made known, and says:

"These figures overwhelm the public mind and there are loud calls in the press for supervision which will lessen what is spoken of as the annual national calamity, and comparisons of similar casualties in other countries are cited to the disadvantage of America.

"It should be remembered that this country has a large excess of railway mileage over any other nation and at the same time less rigid rules as to trespassers and grade crossings than are in force in other countries. Remedial laws are being passed constantly in all the States which tends to an amelioration of the situation, but a great deal remains to be done, in which no doubt the States and railroads will co-operate, as they have for a quarter of a century or more.

"As far as the American railroads are concerned, the figures are stronger against them, as the casualties are not classified in the same manner as in other countries. In England the railroads insist that only those accidents for which they are solely responsible be classified as railroad accidents, and that those accidents which the public or individuals are responsible for be put in a class by themselves. A long series of such reports as are issued in the United States have not brought about the same distinction here. In this country all accidents on railroads are attributed unthinkingly to the delinquencies of railroads. More than half the persons killed on railroads last year were trespassers who lost their lives in disobeying the laws of States and the rules of railway companies. For these casualties the railroads have no responsibility at all. Very many persons were killed or injured while stealing rides on freight trains, and for these accidents it is not proper to hold the railroads responsible. The number of casualties which are properly chargeable to the railroads is a small portion of the total reported by the Interstate Commerce Commission."

The Poor Commissioner.

THE "Northwestern Miller," in sympathetic tones, bewails the fate of the poor railway commissioner, and bespeaks the sympathy of those more fortunately placed. In an editorial in its issue of January 8th, it says:

"The miller regards the Interstate Commerce Commissioner as a personage whose business it is to sit on a raised dais and dispense sorrow. Between time he denies petitions, wrecks plans, and blasts hopes. Now and then he pauses to write an opinion in substance as follows: 'The commission, confidently assuming that it has jurisdiction in this case, is of the opinion that the plaintiff is without sound basis for his petition and that, furthermore, he is in contempt and should, by rights, be indicted for mayhem.'"

* * * * *

"Yet the commissioner has to do it. He has to construe the law in cases that the justice of the peace of Ashtabula, Ohio, would refuse to hear. He has to sit up nights trying to secure a trial balance between the rate on fresh eggs in cases from Texarkana to Memphis and the break-bulk switching charge on crated live hens from South Water Street to Minnesota Transfer. He has to do this and more, and all the while under his windows he hears the dull roar of the populace and feels that they need but a leader to begin the assault upon the Bastile itself.

"Is it ours to wonder why the poor commissioner goes off at half-cock now and then? . . . Would not you do the same? Would not you blow up now and then, strap a cannon to your waistband and go out shooting the little ones on their way to school?

"Do not be too hard on the commissioner. He also is to be pitied. He doesn't get his transit privilege curtailed, but he has to hear complaints that could be decided with a set of A. B. C. blocks and ten fingers to count on; he has to wander through morasses of legal language as dark as the gloom of despair and he has to listen to lawyers with bull-fiddle voices until he himself goes home with an ingrown case of sympathetic croup. He earns his pay. He has his sorrows. Perhaps even now he is sorry for the millers. Who knows?"

The City Freight Station and Its Small Shipments

SOMETHING OF COST AND REMEDY.

By C. D. TRUEMAN.

Editorial Note.—While the author's treatment of this subject may not meet with the endorsement of the majority of traffic and operating officials, it has the virtue of being new and suggesting methods whereby the through movement of freight may be facilitated and certain economies ejected into terminal operations. The author states in a communication of recent date, that the detail essential to the successful operation of auto trucks in the manner indicated in his article, and of making freight ready for them on railroad property has been satisfactorily worked out and that the installation of a practical system presents no unusual problems.

C. D. TRUEMAN.

STEADILY the cost to railroads of handling small shipments of freight within important cities has grown to proportions dangerously near, if not in some instances exceeding, the full gross earning from the whole transportation of such traffic. While mechanical freight handling equipment has been introduced in a limited way in a few instances, as a means of reducing these costs, it is apparent that the most serious increases result from causes not susceptible to mechanical treatment;—from the expansion and elaboration of intra-mural facility and service which an intense and highly competitive commerce requires of railroads. For this reason the hope for effective treatment lies primarily in other directions.

Doubtless the most potent factors of increase are the outer station and the custom of holding unclaimed freight on station platforms for a maximum number of days or indefinitely. Until there is radical revision of these propositions;—revision which will eliminate the outer station as a freight handling proposition, and provide for the concentration of small shipments at *one central station* so as to eradicate their movement by car between widely separated city stations, the cost of handling must continue to rise.

PURPOSE OF THE OUTER STATION.

The chief purpose of the outer station is to bring the physical railroad nearer to active centers of the commercial and industrial expansion of cities;—a short cut as it were, from which the patron of transportation realizes great benefits As the distance between his place of business and the railroad is reduced, so are his advantages over his less fortunately situated competitors increased and his carting expense curtailed. To him such stations are initial gateways to railroad transportation, and it is his understanding generally that freight moves directly from them to remote points.

To the railroad, however, they are necessarily auxiliary to central or transfer stations;—a secondary proposition or the segregated units of a central plant; for, in the practical operation of railroads small shipments for delivery to outer stations must move from the originating point directly to the central or transfer station of the destination city, at which place they are unloaded, the freight assorted, and subsequently reloaded into other cars for movement to their ultimate destinations, whether such destination be an outer or a remote station. While the cost of handling at transfer places, together with the subsequent yard movement necessary to reach outlying destinations, is by no means inconsiderable, it is nevertheless elastic and subject to contraction as varying conditions of business may require, whereas the outer station by virtue of which those costs are created, once erected, gives rise to the further and inflexibly fixed expense of interest on investment, taxes, insurance, maintenance, and depreciation, the sum total of which is chargeable also against the business handled thereat. While the mercantile centers at which such stations are situated contribute an additional tonnage for movement by rail, it comes under conditions requiring elaboration of method, enlargement of facility, and complication of yard operation.

Theoretically and usually, an enlarged volume of business yields a corresponding increase of net revenue, but this is not true of small shipments of freight which pass through stations, for, while the earning therefrom remains constant, the cost of handling per ton unit is the subject of fixed expense and varying conditions beyond the control of railroads, i. e., the earning from a ton of freight may be two dollars, and the fixed cost of owning and maintaining the station at

Digitized by Google

which that ton of freight originates may be thirty dollars per day. It, therefore, thirty tons of freight are handled thereat in one day, the station or fixed cost is one dollar per ton, but if on another day the business of that station declines to fifteen tons, the station or fixed cost becomes two dollars per ton.

Universally the volume of less than carload freight fluctuates widely, and inasmuch as each square foot of station area makes necessary an expenditure for ground on which interest and taxes must be paid, and proportionally increases the cost of insurance, maintenance, and taxes for structure and tracks, it is customary to provide but a limited excess of floor space above that actually necessary to take care of the business currently handled thereat, and to add to or otherwise enlarge such facilities as the development of business may from time to time require. It may, in most instances, be possible to anticipate with accuracy the development of business at any station for a given period of years, but the effect of providing facilities in advance of current needs must invariably be to increase the unit handling cost of business actually existing at the time such structures are provided.

Cost of the City Freight Station.

At one city of about six hundred thousand inhabitants, whose commercial practices, railroad methods and unit costs typify the general situation at important centers throughout the land, one splendidly equipped and managed railroad operates six freight stations, each of which is situated conveniently to one of six active mercantile centers, one being used also for the assemblage and distribution of small shipments originating at and destined to the five outlying centers.

That portion of this complement of stations and accompanying tracks, which is devoted to less than carload quantities of freight, occupies an aggregate of five hundred and twenty-one thousand square feet of ground, valued in the market at $1.40, $1.00, $.75, and $.55 respectively per square foot or $513,000 in all. By adding to this the investment in structures and tracks necessary to give this ground a freight handling utility, the total investment for less than carload purposes is found to be in round figures $1,020,000. This computed on a 5 per cent interest basis, against the tonnage actually handled thereat, shows that each ton of freight passing through these stations costs the railroad in interest alone 15.05 cents. Add to that, taxes, insurance, and a conservative figure for depreciation of structures and tracks, and the cost per ton advances to 22.35 cents. This, then, is the unit expense created by the physical station; the so-called fixed cost, by which it becomes clear that had the railroad provided facilities for a prospective future business;—facilities, say, one-third larger, the fixed cost per ton of freight would be quite close to 29.8 cents, or 7.5 cents greater than it now is.

Additional Expenses.

The movement of such freight between central and outer stations creates a further expense in the way of fixed cost arising from the use of locomotives and cars. By analysis of actual practices this is found to advance the fixed cost, which is properly chargeable against the terminal handling of such freight at the city particularly in mind, to 26.7 cents per ton. To this must also be added 74.7 cents per ton unit as the combined cost of car inspection, repairs, wages of engine and train switching crews, light, heat, water, watchmen and manual labor at station platforms, making the total terminal handling cost, exclusive of supervision, clerical work, and maintenance of running tracks, a fractional part of one cent above one dollar per ton. *Including station clerical work,* this cost is increased to $1.31 per ton, or 6.5 cents per hundred pounds.

While this cost is greater perhaps than is generally suspected, it is not, of itself, a serious matter, but it is the expense arising from *but one* terminal handling, and a similar operation involving a similar expense *is necessary at the opposite extremity of the journey,* while the road haul intermediate to these extremities is a matter of still further expense.

High Cost of Handling Local Traffic.

Summarization of an analysis made by the writer for the purpose of ascertaining the facts as they exist in actual practice, with reference to the operation of several freight stations within one city, including several road and transfer stations of differing classes, shows that 12 per cent of the less than carload tonnage moving to and from that city was local to a 220-mile division of a large system of railroads, and earned gross to that division amounting to $3.06 per ton. By deducting from this the handling cost *within* that city of $1.31, and the cost of passing it through the delivering road station, of from 95 cents at representative country stations to 73 cents at industrial stations, a residue from gross earning of slightly less than $1.00 per ton, with which to pay the expense of its road movement, is indicated. When it was found necessary to pass such freight through an intermediate transfer station 61 cents of the remaining dollar was absorbed, and in round figures but 39 cents remained to pay the expense of its road movement. Almost 50 per cent of that tonnage did necessarily pass through a road transfer station 96 miles from the city referred to.

The most authoritative figure of road costs in the locality under discussion is an average for all classes of freight of .4 cent per ton mile, which means that the road haul up to the transfer station mentioned absorbed 38 cents of the 39 cents which remained. Inasmuch as the purpose of taking freight to a transfer station is to make it ready for a further road movement or journey, it is seen that an average of but one cent per ton remained to pay for the movement beyond that station.

Considered as a *system* rather than a division proposition, the same ton of freight earned gross for that system of railroads $3.68. The cost of handling it at one extremity of its journey was as before $1.31, and while it is not possible to ascertain even approximately, the exact average cost of handling at the opposite extremity of its journey or of intermediate transfer operations, I doubt not the propriety of *assuming* that those costs were and are necessarily greater than is true of the division costs above mentioned. Should they be *no greater,* however, the cost of handling system freight through both the initial and final extremities of its journey, would use up $2.26 of the gross earning of $3.68, leaving $1.42 per ton unit to pay for its road movement. Should it pass through an intermediate transfer

Digitized by Google

station en route, an additional $.61 would be used by which the total handling cost would advance to $2.87, and the residue from gross earning with which to bear the cost of road haul would decline to $.81 per ton.

While the analysis shows that a surprisingly large part of the less than carload freight carried by that system of railroads to and from the city referred to, (both of which are typical of the general situation), is handled at inconsiderable profit, and much of it at an actual loss, the cause for *serious reflection* lies not so largely in that situation alone, as in the fact that such costs *are still increasing*, and that they must *continue* to increase in proportion to the advance of fixed expense arising from enlargement of intra-mural facilities. So long as existing station methods are continued, just as long will more and larger stations—more cars, locomotives, switching crews and yard capacity be necessary.

Possible Remedies.

In searching for remedies whereby the reduction of the cost of terminal handling may be accomplished, the practice of holding freight on station platforms until its consignees or their draymen remove it should be first considered. Unfortunately this practice not only contributes additional expense to the railroad but has the effect, as well, of slowing down the movement of freight between shipper and consignee, and thus compromising high efficiency and precision of road performance. For example, a Pittsburgh shipper sends to one of the freight stations of that city a small shipment consigned to a merchant in the retail district of Cleveland. The car into which it is loaded is sealed about the time the shipper closes his place of business for the day, and by 5.00 o'clock the following morning, or two full hours before the consignee opens his place of business, the car containing that shipment has traversed the 150 intervening miles and is being made ready at the Cleveland station for delivery to the consignee's drayman.

The railroad has performed its transportation work perfectly. It has moved the shipment from Pittsburgh to Cleveland, while the merchant who is to receive it, slept; and has brought along with it about 1,200 tons of similar freight for other persons. This is really a fine performance, and one requiring vastly more preliminary preparation of the physical railroad, its auxiliary parts, and a higher degree of efficiency, precision, persistent human effort, and expenditure of money than is apparent to its patrons. Yet *it has taken the shipment only to its freight station*, where it must remain at the risk of the railroad until the Cleveland merchant calls or sends for it. It frequently happens, however, that he is not aware of the exact time of its shipment or arrival or has not made prompt provision to haul it, so that it remains on the station floor until the following morning, when a postal card sent by the railroad agent informs him of its presence at the station. His shipment then has met delay, and while this has no logical relation to its movement over the railroad, out in the commercial world it is given such relation. The time elapsing between the receipt of that shipment at the Pittsburgh station and its arrival at the consignee's place of business is the commercial measure of transit time, and so the speed and accuracy of the road performance is minimized or lost by reason of the privilege or courtesy of storing freight for brief periods at destination stations.

Cost of Housing Shipments.

Of the stations with which I am most familiar one representative layout of the type and character essential to the less than carload traffic of a large city is of unusual interest, in that it conveys an excellent idea of the cost of housing and protecting such shipments. This particular station is of large dimensions, substantially built, and cost to construct $200,000. It is equipped with slightly more than 6,000 lineal feet of side track costing $1.25 per foot, or $8,000 in all and occupies together with these tracks 186,000 square feet of ground having a market value of $1.00 per square foot. This represents a total investment of $403,000, which creates a permanently fixed expense from interest, maintenance, insurance and taxes of $31.959 per year, summarizing with regard to the actual monthly average of freight handled thereat at 16.9 cents per ton. When it is considered that fully 33 per cent of this facility is required for the purpose of holding or storing shipments until called for, it becomes apparent that the fixed cost thereat is 5.6 cents per ton greater; or that the total of such expense is in round figures $10,000 per year greater than it would be but for the custom of leaving freight there until called for.

Beyond this, the practice of notifying consignees by postal card of the arrival of freight for them, resulting also from the storage custom, is a matter of still further expense as is shown by the experience of the same station, at which a daily average of 400 small shipments, aggregating 200 tons in weight, cost for postal cards and their clerical preparation 2.8 cents per ton, or 1.4 cents per shipment, an aggregate expense for this purpose of $1,800 annually, while the combined cost of such notification at that and the five outer stations previously mentioned is very near to $13 per day, or $4,000 annually. This cost, by the way, is steadily increasing.

Plan for Reducing Terminal Cost.

There is no question but that a period is rapidly approaching when a correction of these matters will be imperatively necessary. Indeed, such steps may be taken at the larger cities even now with decided commercial benefit and reduction of terminal costs.

To eliminate the outer station as a freight handling proposition, wipe out short term storage on station platforms and curtail the need of postal card notification, requires but the inauguration of "store door delivery," or to extend the operation of railroads to the doors of business houses. This may be done easily, profitably, and without disturbance to commerce or transportation, by means of the automobile truck, and while such addition to the accustomed operations of railroads is opposed by men of high connection in the railroad world, its underlying economic principles are nevertheless correct, and eventually the cost and delay incident to methods now followed will require its inauguration as a means of self-protection, if for no other reason.

Viewed from any conceivable angle of observation this question presents the actuality, that the *true destination and origin* of small shipments is always at business or other houses, apart or re-

Digitized by Google

mote from freight stations, and that such shipments are essentially transported between such houses and stations by conveyances operated either by mercantile or private trucking concerns, at costs ranging from fifty cents to one dollar per ton.

ECONOMY OF TONNAGE CONCENTRATION.

By concentrating the tonnage which moves in that way, into the hands of one properly equipped and responsible agency, the chief requisites of low trucking costs will come about automatically, i. e., maximum loads, route order loads, maximum speed between objective points, minimum of empty mileage and loss of time,—by reason of which lower trucking rates would be secured to the merchant without interference to the *profit* from that service. By the operation of such service by the railroad or under its strict control, it would be eminently practicable to handle all less than carload freight at *one central station*, whence incoming freight would be taken from the car and dispatched by truck in route order loads directly to consignees in central and outlying districts of the city, instead of present practice of sending it in cars through crowded yards from central to outlying stations to be again unloaded there, and passed over the platform at further expense, after which a truck operation is still necessary.

The trucking rate *from a central* station need be *no greater* and might actually be made *less* per ton of freight than the present cost of hauling *from outer* stations to business houses where such freight goes. Shipments for outgoing movement may be handled similarly by reversing this operation and assembling it at a central point, with the effect to the railroad of loading cars of merchandise more nearly to their capacity and so reducing the number of light loads moved over the railroad. Such a system would minimize the transit time of freight by the elimination of a character of delay which cannot be controlled in any other way, and would simultaneously wipe out the interchange of merchandise cars between intra-mural stations.

The accomplishment of this end presents no grave difficulty, nor would it require considerable change or addition to central stations now existing, for while the volume of tonnage which would be thus concentrated at one point would be much greater than under the old method, the proposition of handling it is one of *organization and system*. Efficiency alone would determine the rapidity with which freight could be taken to consignees, or from shippers to the station, and in working out the details, the organization and system to be employed at the station, as well as in the handling of trucks, would be determined largely by conditions peculiar to the locality in which such service is to be installed, which briefly would include the boundaries within which trucking is to be conducted;—the normal volume of tonnage within each subdivision of such boundaries,—storage facilities for freight which cannot be delivered in that way,—scale of ton and minimum charge, and other similar questions.

The Government Railways of New Zealand

By H. T. NEWCOMB,

OF THE BAR OF THE DISTRICT OF COLUMBIA.

PUBLIC railway ownership is a topic of timely interest to all Americans. At any moment, a strongly supported proposal to displace private ownership of the railways of the United States and to substitute ownership and operation by the Federal Government may be thrust into the foreground of political controversy. Arguments in favor of such a change that are pertinent and plausible, although perhaps neither conclusive nor sufficient, are not wanting. Certainly there is much to be said in support of uniting control over rates, revenues and financing, on the one hand, with responsibility for an equation between expenses (including interest and the cost of procuring capital) and receipts from traffic, on the other hand, and, apparently, the present development of private ownership with public regulation, is rapidly tending toward their complete separation. Those who look at the problem from this point of view are not unlikely to conclude that for the Federal Government to assume ownership, where it has already assumed a steadily expanding measure of control, would create a saner and safer economic situation. In addition there are two strong classes whose support of such a change may be anticipated. There are (first) those somewhat superficial thinkers who regard the recognized inconvenience of evils of any humanly imperfect system as *proof* that *any* proposed change would be for the better and (second), that exceedingly large and influential body of conservative investors in railway securities (including depositors in savings banks and trust companies, holders of policies of insurance, endowed educational and charitable institutions, et cetera, whose funds are largely represented by railway bonds and shares), who are becoming alarmed at the increasing rigor of regulative laws and methods, and would consequently welcome an opportunity to exchange these securities for Federal bonds secured by the credit of an entire nation and the pledged wealth and earning power of an hundred millions of taxpayers.

Before this problem becomes political and its consideration is complicated by the prejudices and passions of partisanship, every effort to disseminate information on the subject is to be welcomed. The articles by Mr. C. E. Russell, recently the candidate of the Socialistic Party for the governorship of the State of New York, entitled, "New Zealand's Altruistic Railroads," in the September and October, 1912, issues of *Pearson's Magazine*, present the views of a convinced advocate of the nationalization of industry who has some first-hand acquaintance with the results of railway nationalization in New Zealand and they merit consideration. But it is possible to apprehend that Mr. Russell's marshaling of facts has been somewhat controlled, however unconsciously, by his antipathy to the capitalistic sys-

Digitized by Google

tem and his strong predeliction in favor of government ownership and even that, for the same reason, his conclusions of fact are not invariably accurate. Plainly, public understanding would be clarified by the correction of lapses of either character.

Necessity for Intelligent Comparison.

This article will not attempt comparisons between railway service in New Zealand and the United States. The writer is not ambitious to eulogize or defend the railways or railway managers of his own country, but deems that both must stand or fall by means of the impression they have made, or can make, on each individual citizen. It is to agree with the late Henry Demarest Lloyd, a socialist as enthusiastic as Mr. Russell although of clearer perceptions, calmer judgment and more restrained in his assertions, who wrote:

> "Comparisons between results of public ownership in New Zealand and private management in other countries are absurd in face of this complete lack of any similarity in conditions." Newest England, p. 51.

Accepting the foregoing, it is considered that the most illuminating results will flow from an inquiry as to how the welfare of New Zealand itself has been affected by its long-continued policy of public ownership. If, under the special conditions there operating, the system of public ownership has plainly served much more satisfactorily than private ownership elsewhere, the fact will support, in some measure, the inference, that, the necessary changes being made, a similar system might be adapted to the widely different conditions of other countries.

So much depends, in such a discussion, upon the perspective and Mr. Russell so enthusiastically emphasizes those items of evidence which he deems favorable to his cause, that many of his readers must have overlooked the fact that he admits that the people of New Zealand are not wholly pleased with the results of their policy. But, in his second article, he said:

> "Indeed there is no lack of criticism from many sources; the way of the administration is not lined with roses. Indignant members are continually arising in Parliament to inquire why something is not done, or why something is." *Pearson's Magazine,* October 1912, p. 99.

Testimony of Henry D. Lloyd.

On this matter, Mr. Lloyd gives additional and more detailed testimony. Among other complaints, he quotes the following statement of the Canterbury Railway Reform League:

> "For many years past there has been a widespread feeling of dissatisfaction in this district with the policy adopted in the management of the railways. The objectionable features of the management have varied but little with the successive administrations of the last twenty years. The main principle that has been apparent throughout has been a determination to extract the largest possible amount of money from the pockets of the Canterbury taxpayers. Equitable rates and anything like a scientific and intelligent commercial policy have manifestly been subordinated to the exigencies of the treasury. There has been an unreasoning and almost uniform insistence upon high and vexatious charges. Instances are on record where it could be shown that it took years of demonstration to convince the official heads of the value even from a revenue standpoint of certain suggested alterations." Newest England, p. 63.

And, in the same statement, the League charged the political management with enforcing "obviously most arbitrary and unreasonable rates" and with having "ignored the responsibilities which legitimately belong to common carriers." But the relief sought was denied.

Again, Mr. Lloyd says:

> "The 'scientific' traveler could fill a volume with the complaints which he could gather from the remonstrances of railway reform leagues, deputations to the Premier and Minister for Railways, from the debates in Parliament, and from individuals with private grievances." Newest England, pp. 60-61.

Privately owned railways have been charged with killing off the potential competition of water routes by means of discriminatory rates unjustly placed at a lower level than those vouchsafed to places not located on navigable waters. Evidently, this practice, whether warranted or not, is not avoided by the device of public ownership. For Mr. Lloyd says that in New Zealand:

> "Towns with water facilities get freights and fares at competitive rates. Those dependent upon the railroads alone receive no such concessions." Newest England, p. 52.

And, giving a specific instance:

> "I found the citizens of Oamaru full of bitter complaints against the railway management of the state. The city had gone heavily into debt to make a harbour and get the advantage of the water communication which reaches every place of importance in the whole colony. The moment the harbour was finished the department put down its railroad rates and the breakwater and the wharf stand idle, almost a dead loss." Newest England, p. 52.

Even the higher charge for intermediate than for longer distances, so bitterly objected to when made by privately owned railways is not unfamiliar under government ownership. Mr. Russell relates that the private owners of the Wellington and Manawatu Railway were forced to sell to the State because they could not withstand its competition, but he omits the important fact that although supported with all the resources of revenues produced by taxation, this competition involved discrimination against the non-competitive points. Mr. Lloyd tells the balance of the story:

> "The spirit of competition is strong upon a government in business as upon the individual in business. To Palmerston, North, 140 miles from Wellington, by the State railway the rates are made the same as those of

Digitized by Google

the private Wellington and Manawatu road, whose route is only 90 miles long. But the people at the intermediate points, who have no access to a competitive carrier, are still charged the full local rates." Newest England, p. 52.

The Tariff and the Railways.

Other discriminations are not avoided in New Zealand. Customs taxes upon consumption, adjusted for the profit of domestic producers, are the principal feature of the New Zealand revenue system, as in America, but in New Zealand, these tariff discriminations are strongly aided by further discriminations in railway charges.

> "The New Zealand railroad tariff is literally a 'protective tariff.' Slate for house fittings if imported has to pay twelve dollars a ton, where slate of New Zealand manufacture pays only ten dollars. The protective freight rate against imported paper bags and in favour of the domestic article is almost double, and so on with other things." Newest England, p. 34.

In the United States one of the most effective complaints against the protective tariff system has been that, under its shelter, American manufacturers have charged domestic consumers higher prices than those that they obtained for the same articles shipped abroad and sold to foreigners. The State railways of New Zealand sell their services for less to non-residents than to the people of the colony.

> "Rates favouring producers shipping for export are an acknowledged feature of the railroad management all through Australasia * * * * 'We can afford,' said one of the New Zealand railroad officials, 'to help the men who are producers, if we make it up on the men who drink the tea and buy the dry goods.'" Newest England, p. 38.

Physical Characteristics of New Zealand Lines.

Mr. Russell commends the physical characteristics of New Zealand lines, represents that they are provided with an efficient block signal system and states that "70-pound rails are the standard" and adequate on account of the narrow gauge tracks and the light cars and locomotives. It may well be that this standard weight of rails is sufficient but the report of the Minister of Railways for the year 1911, the latest available, shows that the larger proportion of track is far below the standard. The following data are from this report:

Weight of rails per yard	Iron		Steel	
	Miles	Per cent of total	Miles	Per cent of total
40 pounds	100	3.6	136	4.9
45 pounds	..	..	6	.2
52 pounds	61	2.2	24	.9
53 pounds	..	..	867	31.4
55 pounds	..	..	94	3.4
56 pounds	1	.1	541	19.6
65 pounds	..	..	26	.9
70 pounds	17	.6	886	32.1
100 pounds	..	..	2	.1
Total	179	6.5	2.582	93.5

So it appears that six and one-half miles in every one hundred of the New Zealand system are laid with iron rails, obsolete everywhere else in the world, and that less than one-third of the total mileage is laid with steel that is up to the very moderate standard which Mr. Russell accepts.

Mr. Russell is not more fortunate in his statement concerning the block signal system. He says:

> "In the way of safety devices, the operation of trains is on what is known as the tablet block system. It seems to leave nothing to chance nor human error." *Pearson's Magazine*, October, 1912, p. 96.

But the Minister of Railways, in the report for 1911, says:

> "The total mileage of railway controlled by electric tablet at the 31st March was 1,306 miles. The train staff and ticket was in operation on 21 miles and electric lock-and-block on 28 miles."

The foregoing accounts for 1,355 out of the total of 2,761 miles; it is to be inferred that chance and human error may be left some latitude on the other half of the system.

Concerning the efficiency that lies in curves of large radius and easy grades it is but necessary to call attention to Mr. Russell's admission that—

> "The lines are crooked and the grades appalling. On the Wellington-Auckland line there is scarcely so much as half a mile of reasonably straight track. Grades of one in forty and even one in thirty are common." *Pearson's Magazine*, September, 1912, p. 19.

Over these severe grades and "unreasonably" crooked lines the trains can run but slowly. One of the more rapid trains, the express between Wellington and Auckland travels the 426 miles in a little less than nineteen hours at the rate of twenty-three miles an hour, some schedules are as slow as fifteen miles an hour, and a good deal of the passenger traffic is in mixed freight and passenger trains that run even slower. Nor is the absence of plush and inlaid mahogany the only difference that distinguishes the passenger trains of New Zealand from those of countries in which more rapid service might seem to make ordinary comfort in transit less essential.

> "None of the traveling accommodations of New Zealand are what could be described by the American as luxurious, and those that have been provided for the second class are primitive in the extreme. Narrow, uncushioned seats, bare floors, draughty doors and windows, make the cars cheerless and uncomfortable, though in New Zealand, as elsewhere, the majority of the travelers are second class." Newest England, p. 64.

The patrons of American street cars now protest vigorously against longitudinal seats and the latest report of the New Zealand Minister of Railways shows that, in 1911, such seats were being slowly replaced by cross seats in its second class cars and it is also a fact that seat cushions are being gradually introduced.

Location of New Mileage.

Public ownership has not only hindered the development of New Zealand railways, as will be shown later, but it has made the location of such new mileage as could be constructed a matter of political controversy and partisan strategy.

> "Where new roads are to be built is settled in New Zealand by the democracy, by the democratic methods of agitation, petition, election and legislation." Newest England, p. 39.

> "Public meetings are held, representatives are instructed how to vote, resolutions are passed pledging the people to make this railway construction and that railway reform their 'battle cry' and to refuse to vote for any candidate that will not support them." Newest England, p. 61.

In consequence there has been nothing like an orderly and planned development, lines have been unwisely located and built before they were needed or when the same expenditure elsewhere would have been vastly more advantageous. In support of these statements the following quotations from an article by J. E. Le Rossignol, in the *Quarterly Journal of Economics*, for August, 1909, are given:

> "The government had a comprehensive plan of railway construction, involving the completion and extension of lines already begun, so as to make ultimately two main trunk lines running the length of both islands, with feeders into the interior wherever a profitable traffic could be developed. But the pressure of local influence was so great as to compel many deviations from the original plan."

> "In some districts railways were built far in advance of requirements, while in others the people waited long for lines that might have been made to pay * * * *, the appropriations were doled out to more than thirty different districts, with undue regard to political influence. * * * * To such perversions of the original plan may be traced much of the financial failure in railway administration from the beginning until the present time."

Cost of Construction and Equipment.

Mr. Russell states the average cost of building and equipping the New Zealand railways (*Pearson's Magazine*, October, 1912, p. 94) as "about $60,000 a mile" and admits that this seems abnormally high for a gauge of 3 feet 6 inches, as it surely does. But either the recent cost has been more than twice this figure or Mr. Russell was grossly misled when he wrote the following:

> "In the New Zealand railroads there is no increase of caiptalization except for the one item of building and equipping additional lines." *Pearson's Magazine*, October, 1912, p. 93.

But the official New Zealand publication entitled "Statistics of the Dominion of New Zealand," for 1910, gives the following:

Year	Railway Mileage	Capitalization
1895	1,993	£15,352,513
1900	2,104	16,703,887
1905	2,374	21,701,572
1910	2,717	28,513,476
1911	2,753	29,606,546

Converting pounds into dollars at the rate of $4.86½, the following table has been calculated from the foregoing data:

Period	Increase in mileage	Increase in capitalization	Average capitalization per mile of new mileage
1895-1900	111	$6,573,948	$59,225
1900-1905	270	24,313,738	90,051
1905-1910	343	33,139,913	96,618
1910-1911	36	5,317,785	147,716

These figures show that the increase in opened mileage between 1910 and 1911 was 36 miles and that $5,317,785 was added to the capital charged to opened lines during the same period. Either the cost of the new mileage was $147,716 per mile, plainly an highly exorbitant cost for any narrow gauge construction, or a part of this new capital was charged to lines opened in earlier years. And the same statement would be applicable to the apparently progressively increasing cost of such five-year periods since 1900.

High Rates.

The standard of excellence invoked by Mr. Russell is implied in the following:

> "To the average New Zealander a railroad is a device that at the lowest possible rates carries to market the things that people must have." *Pearson's Magazine*, September, 1912, p. 18.

It has already been shown that in selecting the markets to which it will carry at the lowest rates that it offers, the New Zealand governemnt discriminates in favor of the foreign market, but, beyond this, its rates are not to be regarded as low according to the standards that prevail elsewhere.

> "New Zealand freight rates are of course high in comparison with ours." Newest England, p. 51.

> "For first-class travel in New Zealand the average cost (including commutation, return and special excursion tickets) is two and one quarter cents a mile. Ordinary one-way fares are higher. The one-way first-class fare between Wellington and Auckland is $13.23, which equals 3.1 cents a mile." *Pearson's Magazine*, September, 1912, p. 19.

> "Passenger rates * * * * are definitely settled on the basis of two cents a mile, *second class*, irrespective of the line or the distance." *Pearson's Magazine*, September, 1912, p. 19.

> "It seems probable that the average fare per passenger-mile is slightly under 1d. (2 cents), and, therefore, very close to the average of the United States (2.014 cents)." J. E. Le Rossignol, *Quarterly Journal of Economics*, August, 1909.

Digitized by Google

"* * * * the average charge per ton-mile is not much less than 2d. (4 cents), and certainly not less than 1.75d. (3.5 cents), * * * *" J. E. Le Rossignol, *Quarterly Journal of Economics*, August, 1909.

The Political Influence.

Mr. Russell seems to have attempted to avoid the inevitable refutation of his conclusions reposing in the fact that the average rates of New Zealand are not low, by dwelling at considerable length upon certain railway services that are there performed "gratuitously, or something like that" (*Pearson's Magazine*, September, 1912, p. 19), that is either for nothing or at rates that are obviously below cost. Such services are varied and numerous and some of them have the sanction of ultimate economic advantage but no one can fail to observe that they are manifestly granted, in nearly all if not all instances, for the benefit of social groups of a certain solidarity, the united support of which must be assumed to be of great political advantage. The bare enumeration of these services must suggest the observation of that profound political philosopher, the late W. E. H. Lecky, that with universal suffrage the art of politics requires each candidate to become a competitive bidder for the support of as many as possible of those groups into which the different interests and opinions of mankind divide every society. It is easy to imagine the New Zealand candidate soliciting the support of those to whom railway services are granted without charge or at charges much below cost and arguing the value of these services and claiming to have shared in rendering them available—or it may be promising to extend such favors to other groups. And every writer on New Zealand's railways has given testimony that this is exactly what does happen.

There is, however, no such thing as free railway service nor are such services ever actually obtained for less than they cost. If a service is free to the person directly advantaged by it, its cost is borne either by the purchasers of other services or—given government owned railways—by the taxpayers. And if rendered for a rate less than cost the difference must be made up in the same way. There is no difficulty in discovering who has made up the persistent annual deficit of the railways of New Zealand—these losses have been met by taxation.

> "None of the Australasian governments make both ends meet in their railroads. None of them are able to pay out of the receipts of the railroads the full interest on the money borrowed to build them. The taxpayers have to go down into their pockets every year to make the deficit good." Newest England, p. 49.

The People's Burden.

This is the larger and final aspect of "New Zealand's Altruistic Railways." For their sake the Dominion has assumed a vast burden of indebtedness, they do not pay expenses, and the taxpayer foots the bill. Before proceeding to further proof of this assertion let an answer be given to the inquirer who asks who this New Zealand taxpayer is.

> "The total revenue from the land and income tax is only $3,329,340 a year, while the tariff produces $10,201,155. The average rate of the tariff is twenty-five per cent and the rates on the necessaries of life are much higher than the average. Tea is forty per cent; sugar, thirty; rice, forty-two; salt, forty-eight; kerosene, ninety. The largest taxpayers are spirits, tea, sugar, tobacco, kerosene, currants. These are the poor man's necessaries; which means that a man pays taxes according to the size of his family; and the poor man in all countries is the family man." Newest England, p. 124.

In 1911 the New Zealand customs tariff produced $14,730,388 and the land and income taxes produced $5,039,936. The New Zealand customs tax was at the rate of $14.61 for each man, woman and child in its population; the tariff of the United States, which is not considered low, produced, in the same year, at the rate of $3.35 per capita of population.

Low Earning Power.

The present average rate of interest on the par value of the public debt of New Zealand is 3.7 per cent, but, as less than par has been realized by the New Zealand treasury from the sale of its bonds, the actual rate is higher. Assuming the cost of railway capital to be 3.7 per cent, however, the following official statistics, from the latest report of the Minister of Railways, show that in only two of the last thirteen years has this rate been earned even on the amount of capital carried on the records as the cost of the railway open to traffic, an amount that is understated in a manner obvious to any accountant.

Year	Per cent earned on cost	Year	Per cent earned on cost
1899	3.29	1906	3.24
1900	3.42	1907	3.45
1901	3.47	1908	3.33
1902	3.43	1909	3.13
1903	3.30	1910	3.80
1904	3.58	1911	4.06
1905	3.30		

The foregoing percentages are all, in fact, much too high. For example the average for 1911, 4.06 per cent, was calculated upon the nominal cost of £29,606,546 which is far too low. To get the real amount of taxpayers' investment in railways this sum must be increased by £1,903,414, the cost of railways not yet opened, and by £4,256,025 the admitted sum of the accumulated deficits, so far as they are of record. This would make the total cost in 1911, £35,765,985, or $174,001,517. As the surplus over operating expenses was £1,190,910, or $5,793,777, this gives a return on capital of 3.33 per cent. Even this percentage is above the truth for the same corrections ought logically to be applied to all the earlier years, thus increasing the annual deficits that are properly to be carried into cost. It is wholly probable that the real present capital cost of the New Zealand railways exceeds £40,000,000 and, consequently, that the actual return on capital for the best year in their history was less than three per cent.

Enormous Public Debt.

The New Zealand taxpayer cannot be oblivious to the fact that the governmental policy, of which

Digitized by Google

railway ownership is a part, has piled up in that land, so favored by its isolation that it shares with the Commonwealth of Australia the advantage of being the only region on the globe where national indebtedness does not represent almost exclusively the losses of destructive warfare, the greatest per capita public debt that burdens any people. The following figures are from the latest Statistical Abstract of the United States:

NATIONAL DEBTS.

Country	Average per capita of population	Annual interest, per capita of population
New Zealand	$363.05	$11.58
United States	10.88	.23
France	158.60	4.70
German Empire and States	75.40	3.45
Italy	75.08	2.80
Russia	28.93	1.29
Spain	98.00	4.04
Canada	66.46	2.10
Brazil	38.60	1.36
Argentina	91.50	4.38

LACK OF DEVELOPMENT.

Such comparisons as the foregoing require no comment; they speak for themselves. It is not surprising, that with this accumulating burden of indebtedness and with its notoriously unprofitable railway system, public ownership has proved an hindrance rather than an help to railway development. There is no other possible explanation of the fact that from 1900 to 1910 the railway construction of New Zealand was at the rate of barely sixty-one miles per year and that in the fiscal year 1911 only thirty-six miles were opened to operation.

> "In the four years from 1873 to 1877, 907 miles of railway were completed, making an average of 251 miles a year. In the ten years following only 701 miles were built, in the next ten years only 304 miles, and in the ten years ending March 31, 1908, which were years of great prosperity, only 416 miles were completed, not because the colony had all the needed railways, nor because none of the projected lines could be made to pay, but chiefly because of the inability of the Government to borrow adequate sums; and this may be traced to the unprofitable character of the lines already built." J. E. Le Rossignol, *Quarterly Journal of Economics,* August, 1909.

> "A section of the main trunk line between Auckland and Wellington, about two hundred miles in length, has taken twenty-three years to build, although it was the most important link in the whole system, and promised to develop a large and profitable traffic." J. E. Le Rossignol, *Quarterly Journal of Economics,* August, 1909.

> "* * * * the funds available for railway construction have been distributed, not to say frittered away, in various parts of the country, in the building of small bits of line, instead of being concentrated on one or two important works. This was largely due to political considerations." J. E. Le Rossignol, *Quarterly Journal of Economics,* August, 1909.

Thus the public railways of New Zealand have caused a vast burden of public debt and taxation, which has already retarded their adequate development, and without preventing discriminations in charges or affording services at rates as low as those offered in the United States or elsewhere where private ownership prevails. The annual deficits are made up by high taxes on consumption and the wealthy and landed classes are the chief beneficiaries of the system. Even the employes of the railways protest that they are underpaid and subjected to conditions that would not be tolerated in private enterprises.

> "* * * * even now the railway employes, if one may believe the Amalgamated Society of Railway Servants, and their organ, the *Railway Review,* are receiving wages rather less than are paid in private employ, while their hours of labor are frequently much higher than would be tolerated in any private business subject to the jurisdiction of the Arbitration Court." J. E. Le Rossignol, *Quarterly Journal of Economics,* August, 1909.

And even socialist writers are reluctantly forced to complain that, after forty years of experiment, New Zealand has not yet discovered a scientific system of railway rate-making.

> "The persistence of public complaints through all these changes indicates that there is a more radical defect, and that there are deeper questions which the people of New Zealand have not grasped. Even under public ownership the democracy has not yet found out how to make a democratic railway tariff." Newest England, p. 78.

Why this general complaint and lamentation even on the part of the irreconcilable and convinced advocates of the plan New Zealand has so long followed? Did Mr. Lloyd, in the foregoing sentences, put his finger on the real problem, or does it lie in an even deeper and more fundamental defect of public ownership? The present writer believes that the last question must be answered in the affirmative. If railway users, great centers of population, taxpayers and railway employes all complain; if the holders of national bonds and those to whom further issues are annually offered for sale assert that New Zealand's railways are unprofitable and if its credit in the world's centers of finance is seriously questioned, the real explanation is found in a system that capitalizes all its errors and omits the strongest incentive to improvement. The private railway builder puts his fortune at hazard and is spurred on to public service by the hope of profits that are inseparable from public gain. Errors on his part lead inevitably to loss of capital and bankruptcy finally reduces the interest charges on the private property to its reasonable earning capacity—the mistakes of public ownership are seldom eliminated from the public debt, they must be liquidated by taxation or forever draw interest at the expense of taxpayers. Thus higher penalties for mistakes and more numerous mistakes are the inevitable consequences of public ownership. The profits of private owners are, normally, but a fraction of the real gain of private over public ownership. This advantage has been stated, with especial reference to mu-

Digitized by Google

nicipal ownership, by a distinguished American economist, Mr. Allen Ripley Foote, in a brilliant and philosophical paragraph, that is at once so accurate, so lucid, and so convincing, that it should live forever among the most splendid and undying assertions of vital truth. With that paragraph, equally applicable to the contrast between public and private railway ownership, this article will be concluded:

> "There is an economic advantage inherent in private ownership that cannot be acquired by a municipality. The operation of this advantage creates the profit for which the company works, and which, when created, belongs to those creating it as justly as the pay for a day's work belongs to the honest workman. This economic advantage ceases to exist when an industry passes from private to municipal ownership. It eludes municipal ownership as surely as the secret of life evades the surgeon's knife. It cannot exist in slavery; it is the offspring of freedom. It is the advantage of personal responsibility, of guaranteeing the saving to the one who saves, the economic advantage of a hope. This advantage stimulates enterprise, induces thoughtful care and inspires energy."

The High Cost of Railroading*

By B. F. YOAKUM,

CHAIRMAN, ST. LOUIS AND SAN FRANCISCO RAILROAD COMPANY.

TALKING about what is costs to live, I have chosen the railways as an illustration, because their prosperity or the reverse means the prosperity or depression of the whole country, and because eighty per cent of the cost of all material bought by the railways goes to labor, and the advance in the cost of doing business in this giant industry may become a menace for the future of the whole country.

We find this subject of high cost the main issue in every wage conference between officers and men. We find it the basis of every strike, every spasm of discontent. We meet it year by year in our coal bills. We struggle with it every time we have to pass on bids and specifications for new cars, new engines or new supplies. We tackle it again whenever we come to figure on building a new line to meet the needs and demands of the people in undeveloped sections, awaiting transportation that development may go forward. It hits us hard again in our tax bills and our payments in personal damage suits.

B. F. YOAKUM,
CHAIRMAN OF THE BOARD OF THE FRISCO LINES.

We come face to face with it in our dealings with the bankers and investors of the world. The era of easy money for railway building, railway improvements, railway expansion has temporarily passed away. To-day, we pay five and one half dollars in interest for the same supply of capital that, in other days on equal security, cost us only four and one-half dollars. When we consider that the railway business, in the nature of things, must always be a tremendous borrower of capital, the importance and the imminence of this question of the cost of capital becomes apparent.

Under present conditions the only sane argument for favoring government ownership lies in the fact that the interest rates would be an average of two per cent less per annum. On the present bonded debt this would amount to saving about two hundred million dollars a year. The service to the public, the development of the country and the freight rate would be worse than on the railway as now managed. While government management of our transportation system would probably be undesirable, the government should, in the interest of the people, do all that it consistently can to aid in the railways' credit in finding new money to carry on improvements and new railway building.

It is difficult to lay the blame for this condition upon anyone in particular, yet the fact that the greatest instrument in our future development is being crippled all thoughtful men must see. Perhaps, in our railway expansion and railway enthusiasm, we have done some things that have accelerated the decline of American railway credit, but the best critics of the world acquit the American railway of any great inflation in their bonded debt, even though they have at times

*From the Santa Fe Magazine.

Digitized by Google

criticised expansion in the stocks and junior securities.

These matters that I have cited are some of the facts. There are other facts equally important. I am not a pessimist about American railways. This year we look for apparently abundant crops and to the high class railway freight business that will result throughout the whole year from this abundance. Net earnings will expand and we shall have a new lease of life.

Up to the present time there has been a constant saving in actual cost of moving freight and passengers—through the constant advance in the weight and power of locomotives, through larger cars and through the resulting larger trainloads that have been possible. That saving in expense is reaching its limit. Advance in overhead charges from this time on, according to the judgment of mechanical officers most skilled in these matters of transportation science, must be met without much further aid from the mechanical ways and devices. We have reached a period when much greater economy in transportation seems almost impossible, and if there is to be a much further reduction in cost in conducting transportation it will have to be through curtailment of service to the public.

Although our revenue producing plant has been constantly enlarged, we have also been forced by public demands to meet a hundred other expenses that have produced no return in kind. Aside from the increase in taxes enumerated, more than seventy thousand miles of road have been equipped with block signals; hundreds of miles of track lying in cities and suburbs have been elevated at enormous expense; terminals and stations have been built at great cost; the weight of standard rails has been increased from seventy-five to ninety pounds to the yard to carry the heavier equipment; old stations torn down and modern stations literally by the hundreds have been built to meet the demands of the public; last, but not least, we have spent two hundred million dollars to meet the cost of regulation and supervision of operations by the federal government and the authorities of the states which we serve. These are purely unproductive expenditures. They come with serving the public and are part of the price we have to pay to live and carry on our business. They are overhead charges upon our income fixed by the government.

I write as a railway builder. The railway I helped to plan and helped to build is to-day employing more than fifty thousand men. Their families make up an army of a hundred and fifty thousand people who draw the support and education of their children from our payrolls. In the part of the country where my work has been done railways still are needed. East of the Mississippi River there are less than five thousand acres of land to every mile of railway, but in the West there are more than thirteen thousand acres. Oklahoma is only half supplied with railways. Arkansas is barely prospected, Louisiana is short of transportation properly to develop the state. Texas needs very badly at least ten thousand miles of new line. Arizona, New Mexico, and, in fact, almost all the Western states, need a large amount of railway building in the next ten years. I know that these great regions of the Southwest never can come into their own until they get the transportation facilities they need. I should like to see railway building go forward. It cannot be done in a large way until the future of the railway business is clearer than it is to-day.

This is the result from the standpoint of new construction—namely, that it has come to a temporary halt and must remain stagnant until a solution is reached.

These things must not happen. It is unthinkable that the mass of the American people desires to destroy the greatest of the constructive industries, the building of new railways. It cannot be conceived that the interest of the whole nation will be served by bringing about a condition that tends to injure the world-wide credit of the American railways to a point of saying that we do not want more railways to enable us to go on upbuilding.

A political leader strong enough to formulate a combination constructive and regulative policy will eventually take hold of this most important question and promulgate it. I fully expect to see a resumption of the building of railways, establishing new cities, the opening up of untilled lands, and patient people waiting for railways to develop their lands, coaxing thousands of producers every year into the rich new country in which such work will be carried on. That means that a solution of the present difficulty, which amounts to a deadlock, will be found before it comes to the era of a setback.

Here is need of real constructive statesmanship. This is a problem of pure statesmanship. It is not a matter of political jobbery, of academic theory, of experimental haphazard procedure. It is not a matter that can be settled and laid aside by political chicanery, by the expounding of academic ideas, by the piling up of bureau upon bureau at Washington and commission upon commission throughout the land.

Practically all the legislation, state and federal, on the matter of railways in the past decade has been restrictive, prohibitive, regulative. Some of it has been salutary; some of it has tended to be destructive. What is needed now and what we must have if we are to go forward is in the direction of upbuilding. We have been told in a thousand ways what we must not do and dare not do. The administration of the future must tell us what we can do and show us the way to do it.

How Impressions are Formed.

THE following is taken from the "New York Journal of Commerce":

"'Suspends Freight Advances' is a headline relating to the work of the Interstate Commerce Commission that has become so familiar of late as almost to warrant keeping it standing in type. The suspensions thus effected have usually been crystalized into refusals to permit the advances referred to, to take effect. If the Commission would use somewhat greater discrimination in its action, there would be greater confidence that the policy of holding rates down was being applied with wisdom and in a way that would not damage the carriers' best interests. Recent indications that the Commission is again divided within itself with regard to the general freight rate question show the difficulty of the subject. The so-called 'progressive' element in the body needs to proceed with caution in order that it may not incur the danger of having its policy reversed instead of modified, in consequence of public demand."

Rail Failures

By C. H. BENJAMIN,
DEAN, SCHOOL OF ENGINEERING, PURDUE UNIVERSITY.

IT would perhaps be too much to say that railway accidents are more numerous than formerly; probably the reverse is true, but owing to the higher speeds and heavier weights, the accidents when they do occur are more disastrous in their effects. In studying the causes of such disasters, we find too often evidences of negligence either on the part of the railroad company or of its employes. The absence of proper signals or the failure on the part of the engine crew to notice them when set, coupled with a tendency on the part of employes to take their chances on cautionary signals and trust to luck that the block may be open before they reach it, has led the traveling public to distrust human care and to urge the use of automatic control. The improper laying out and weak construction of switches and crossovers have also been the cause of many disastrous wrecks. All such accidents may be classed under the head of preventable, that is, a reasonable amount of care and oversight on the part of the road in question coupled with a proper observance of the rules by the employes, would have made them impossible.

There are still remaining, however, a class of accidents due to failure of parts of the brake equipment, to fracture of the wheels or to broken rails, that can not so easily be foreseen or prevented. Proper inspection of the running gear and brake machinery at frequent intervals will do much to prevent wrecks on account of imperfections in the cars themselves. Similar inspection by section men of the permanent way will detect many of the imperfections in the rails and their fastenings. Some, however, of the flaws in steel rails which will sooner or later lead to their destruction are invisible to the naked eye and only make their appearance under stress of circumstances and at serious risk to all who travel over them.

One of the worst railroad accidents in the recent past was that on the Lehigh Valley near Manchester, New York, in August, 1911. Many of the cars were precipitated into the bed of the creek, resulting in a loss of approximately thirty lives and more or less serious injury to sixty people. It seems to be the general opinion that this wreck was due to a fractured rail a few lengths from the entrance to the bridge. An examination of the rail which probably caused the wreck showed evidence of imperfection in the material due to the presence of slag and segregation of materials. The appearance of so-called transverse fissures was probably due to imperfection in the manufacture, but in the opinion of some experts, was produced by continued cold rolling of the rail under excessive wheel pressures. This point is still at issue between the manufacturers and the railroad men. It is doubtful whether the imperfections in this rail could have been detected by external inspection. There is evidence that the supervisors of the road in question had given explicit instructions to the road foremen to watch the rails carefully for any sign of piping or other defects. This is only one of numerous accidents which have been caused by broken rails.

In seeking for the causes which lead to such a

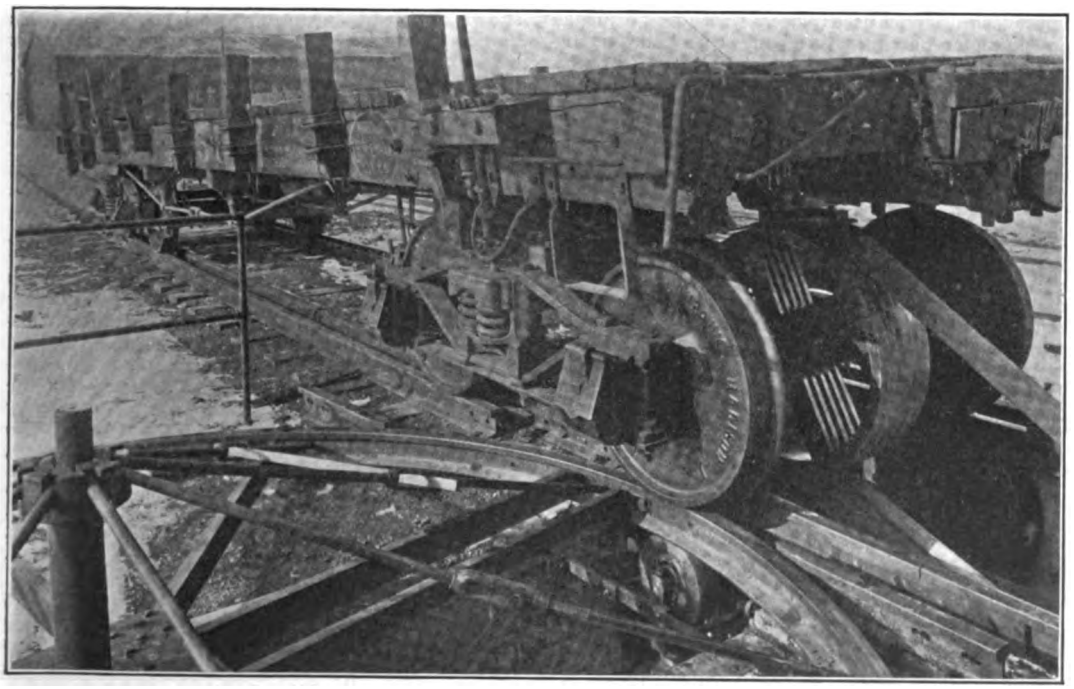

FIGURE 1.—FLAT WHEEL MACHINE, PURDUE UNIVERSITY, WITH CAR IN POSITION.

Digitized by Google

state of affairs, it is necessary to consider the development in railroad and car construction during the past twenty-five years. In that time the weights of cars and locomotives have more than doubled and the intensity of wheel pressures has increased enormously. The speeds of trains have probably increased 50 per cent, if not more, in the same time. The weights of rails have been increased to meet the demands upon them from 50 pounds to 80 or 100 pounds per yard, and the tendency has been to make the rails harder so as to reduce the abrasion and wear. The high wheel pressures have made it absolutely necessary to substitute comparatively hard steel for the iron or mild steel formerly used. The improvement in rail making machinery has led to a much higher speed in handling and rolling and this has possibly increased the possibility of imperfect treatment.

Apparently increasing the weight of the rail has not solved the problem completely. It certainly has not diminished the intensity of pressure on the metal at the point of contact and that this pressure has become dangerously high is instanced by the numerous breakages.

Experiments made in the testing laboratories of Purdue University on the area of contact between driving wheel and rail under different pressures, indicate an intensity of pressure above the elastic limit of the rail material. These tests were made by putting a piece of carbon paper between two pieces of tissue paper and inserting this between wheel and rail. The area of contact being readily marked on the one piece of tissue paper was measured with a planimeter. Dividing the total pressure on the wheel by the whole area of contact would give the average pressure, or assuming that the pressure varied uniformly from nothing at the edges to a maximum at the center, half the area would be used as a divisor to give the maximum intensity of pressure. The driver used was a steel one 79 inches in diameter, manufactured by the Schenectady Locomotive Works. A large number of tests with the wheel in different positions as regards the location of crank pin and countershaft showed with loads of from 25,000 to 30,000 pounds an average pressure of over 50,000 pounds per square inch and a maximum pressure of over 100,000 pounds per square inch.

Now, the loads on the drivers of our larger types of engines are from 25,000 to 30,000 pounds per driver. Assuming that this produces for each driver an intensity of pressure between wheel and rail of 100,000 pounds per square inch at the center of contact, we have apparent a possibility of considerable distortion of the metal in the rail by a cold rolling process under such pressure. Experiments have shown that it is rather the rail than the wheel which yields, probably due to the fact that it is not so well supported. If we add to this a succession of blows due to irregularities and imperfections in wheel and rail, we have a condition of affairs which would certainly invite trouble. While the load per wheed of the freight cars in general use is not so great, the wheel itself is much less in diameter and would give a smaller area of contact and more pressure per pound of load.

Irregularities due to eccentricity of wheels, to uneven wear, or to flat spots are an additional cause of rail failure. One prominent road during the past winter broke over six hundred rails with one flat wheel, and other instances might be cited nearly as startling.

The 2½-inch limit for flat spots was adopted in 1878 when the loads and speeds were very much less than at present. Many roads have adopted a smaller limit for passenger service, but there is a general uncertainty as to just how much danger arises from flat wheels. The apparatus recently installed at Purdue University and illustrated in Figure 1 is intended to throw some light on this question. The car is shown in position with one of the axles of forward truck driven by a motor and belt. One wheel of this axle rests upon an idler and the other drives a circular rail rotating on a horizontal plane and supported by ball bearings. The pressure of the wheel is transmitted through the rail to a hydraulic plunger resting on oil and is measured by an indicator of the ordinary type. Tests of various widths of flat spot and various speeds and loads will undoubtedly throw much light on this problem. Arrangements are made for calibrating the apparatus in position by means of a drop press.

Another cause of danger in winter time is the effect of low temperatures on the brittleness of steel rails. That there is such effect can not be doubted by those who have studied the excessive number of rail failures during the unusually severe weather of last year. Just how much the ductility of a rail is affected by different degrees of temperature is uncertain. It is proposed this winter to make a series of tests on rails in various atmospheric temperatures under the Master Car Builders' drop press at Purdue University. This apparatus is illustrated in Figure 2. A drop whose weight can be varied for different experiments and having a maximum fall of 50 feet is to be used for this work. The influence of high speed can not be disregarded since the higher the speed of the train, the more frequently occur the reversals of stress as the wheel passes over the tie and then over the interval between ties. Observations on the New York Central Lines have shown that breakages are more frequent on down grades where the speed is high than on upgrades where the speed is necessarily reduced.

The chemical composition of the rails, of course, has much to do with the matter, and an excess of either carbon or phosphorus is pretty sure to result in disaster. Increasing the amount of carbon in the steel so as to give a rail which is harder and will wear longer necessarily increases the brittleness of the rail and reduces its ductility. Experiments made by the New York Central Lines show a decided improvement from the use of open hearth rails where a special effort has been made to increase the ductility by keeping the amount of carbon low and the phosphorus below .04.

Inspection of broken rails has shown the probability of some of them being injured by the straightening processes in the mill. The severity of the stress required to take the kinks out of the rail when it is comparatively cold is sufficient, in many cases, to injure the material.

All the evidence so far obtained tends to show that the open hearth rail as a rule is more reliable than the Bessemer rail. This is naturally to be expected from the more deliberate nature of the process and the better opportunity for determining the composition accurately. Tests made of rail specimens at the mill while valuable in a way are more or less inconclusive unless it is assumed that the rails are homogeneous. Unfortunately the fact that one end of one rail will not break under a certain blow is no evidence that another rail will not or that the other end of the same rail

Digitized by Google

will stand such treatment. A much better criterion is a correct and careful record of all the rail failures in service by all the railroads, coupled with a history of the broken rails from the time of their rolling to the date of failure. Such statistics are being compiled at the present time by the American Railway Engineering Association, printed forms and instructions being furnished the different railroads so that the reports may be uniform in character. The deductions of the Rail Committee of this Association as published in the report for July, 1912, are given verbatim. I would call particular attention to paragraphs 2 and 4:

(1) The statistics are for all roads and do not take into consideration differences in tonnage and physical characteristics, but are valuable as showing averages derived from studying the performance of large quantities of rail from different mills. The results may be considered as fairly representing the performance of the different mills.

(2) The wide variation in results shown must be due to a great extent to a lack of uniformity in the product of any individual mill.

(3) Wide variation from the specified chemistry for rails has been found in the product as furnished by the mills. If a comparatively low carbon has been specified and a higher carbon material has been furnished by the mills than supposed, then erroneous deductions may be drawn unless the chemistry of the rail furnished is accurately determined. There should be greater insistence in the future in seeing that the specified requirements are complied with, and it may be necessary to take chemical tests from the finished product more frequently than heretofore, as well as from the sample test ingots.

(4) The statistics show in many cases that the average performance of the heavier sections is not so good as the average performance of the lighter sections.

(5) The mill people have furnished a long list of defects found in track and track maintenance. It is to be noted that, in many cases, the highest rate of failure of rails is found on roads with a reputation for a high state of maintenance. Head failures, such as split and crushed heads, predominate. The Committee is not willing to admit that such failures are the result of imperfect track conditions.

(6) The open-hearth rail, as a whole, shows a lower rate of failure than the Bessemer, but the average rate of failure for open-hearth is higher this year than last year, while the Bessemer shows lower rate this year than shown last year. Can it be that, as the age increases, the rate of failure with open-hearth rail will increase so as to approach the Bessemer figures?

(7) The statistics indicate that the material in the top of the ingot must be of a poorer quality than that lower down, and that, in many cases, sufficient discard has not been made from the top of the ingot.

It is evident from a study of the statistics furnished by this Committee that the most conspicuous fact is the lack of uniformity of product either of different mills or of different lots from the same mill. Until this condition is remedied, we can not look for any permanent improvement.

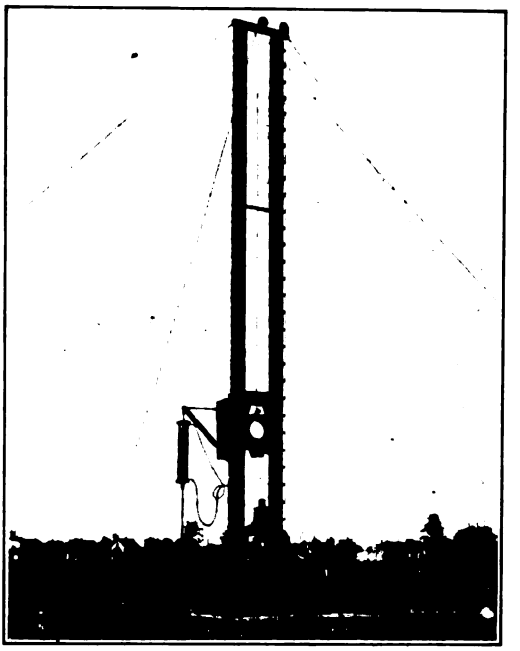

FIGURE 2.—MASTER CAR BUILDERS' DROP PRESS, PURDUE UNIVERSITY.

As was stated in the report of the same committee for the previous year, "At the present time the quality of the material is so variable that neither minor differences in section nor in chemical composition have serious weight." Of the total number of rails reported for three years ending in 1911, the character and failure was as follows:

Broken	825
Head failure	1772
Web failure	330
Face failure	263

It may be seen from these figures that failure of the head is the most common type with the broken rail coming next. As a rule, it is only the broken rail which causes serious accident as the other failures are more or less gradual and may be detected in time.

The most common cause of rail failure is the so-called piped head or web due to the presence of occluded gases or slag in the top of the ingot, while the more frequent cause of broken rails is probably the segregation of different materials in the head of the rail. It is entirely possible, however, that a rail may break simply by reason of the presence of too much carbon or phosphorus.

In making these criticisms, I would wish to disclaim any intention of criticising either the mills or the railroads. I believe that the efforts of the better class of manufacturers and the more far-seeing and energetic of the railroad men are earnestly directed towards a study and correction of this evil: that there has already been a great improvement in conditions at some mills and on some roads. Undoubtedly the tabulation of statistics by the railroads of the country and the tracing up of defective rails to their origin will give a mass of material which can be studied with great profit by all who are interested.

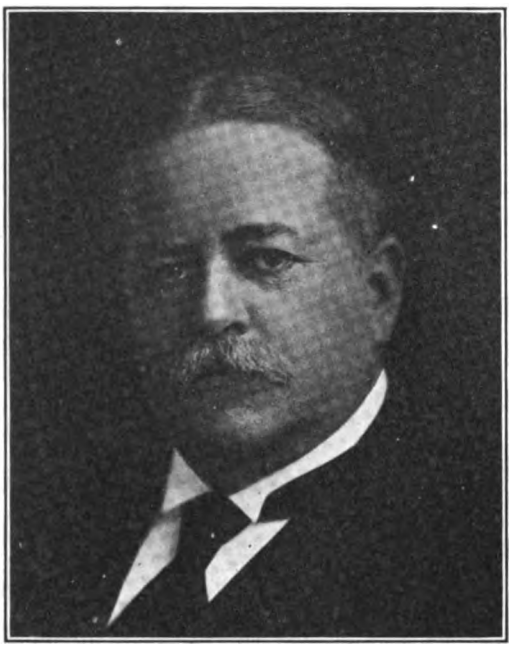
Personal



JULIUS KRUTTSCHNITT.

MR. KRUTTSCHNITT, who, on January 13th, became chairman of the Board and Executive Committee of the Southern Pacific Company, is a native of New Orleans, where he was born July 30, 1854. His parents were John and Penina (Benjamin) Kruttschnitt, the father being of German descent, while the mother's ancestors were early settlers of South Carolina.

After graduation from Washington and Lee University, from which he received the degree of civil engineer with the class of 1873, Mr. Kruttschnitt taught for five years in McDonogh School, located near Baltimore, Maryland.

Immediately after leaving McDonogh, in 1878, he entered the service of the Morgan's Louisiana & Texas Railroad Company, and became engineer in charge of construction. On completion of that line, in 1880, he became its roadmaster, and up to 1885 had filled the positions of general roadmaster and chief engineer, and superintendent and chief engineer, being then advanced to the position of assistant general manager of the Southern Pacific Company's Atlantic System, embracing all lines and territory east of El Paso, Texas. He was general manager of the system just named from 1889 to 1895, and was then advanced to the position of general manager of all Southern Pacific Company lines, with headquarters at San Francisco. April 7, 1898, he became fourth vice-president of the Southern Pacific Company, and from 1901 to 1904 was assistant to president.

On April 1, 1904, he was promoted to the position of director of maintenance and operation of the Union Pacific and Southern Pacific lines, with headquarters at Chicago, Illinois, until December, 1911, when headquarters were transferred to New York City.

Mr. Kruttschnitt is also a director of the Chicago & Alton Railroad and president of the Union Pacific Coal Company. He is president of the American Railway Association, an organization that comprises in its membership all roads of importance operating in the United States. He has recently resigned as a director of the Union Pacific System.

Robert Garrett.

AT a meeting of the Baltimore and Ohio board of directors, held last month in New York, Samuel Rea, the new president of the Pennsylvania Railroad, who had been one of the Pennsylvania's representatives on the board for the last 12 years, retired and Robert Garrett, grandson of the master builder of the road, was chosen to succeed him.

The statement was made that because of Mr. Rea's recent election to the presidency of the Pennsylvania, and the consequent increasing tax on his time and attention, he felt it necessary to be relieved and therefore resigned.

The retirement of Mr. Rea from the board, leaves the Pennsylvania with only two seats.

The election of Mr. Garrett again connects the Garretts with the management of the property that was built by the Garretts from small beginnings to one of the greatest of the country's railroad systems. John W. Garrett, grandfather of the present Robert Garrett was the creator of the Baltimore and Ohio as a real railroad system. He was one of the great creative railroad geniuses and perhaps the foremost pioneer in the American railroad field. His conception was the largest and his methods of carrying it out the most masterful.

ROBERT GARRETT,
RECENTLY ELECTED TO THE BOARD OF DIRECTORS, BALTIMORE AND OHIO RAILROAD.

Digitized by Google

John W. Garrett's first official connection with the road was when he was a member of the firm of Robert Garrett & Sons, established by his father, Robert Garrett, of which firm his grandson and the great-grandson of the founder, is now the head. It was in 1854 that John W. Garrett was appointed chairman of a special committee of stockholders, formed to reorganize the finances of the company.

Three years later he was elected president of the road, and remained in that position until the time of his death in 1884.

Two months after his death his son, Robert Garrett, uncle of the newly elected director, who was first vice-president, was elected to the presidency. During Robert Garrett's administration the company's lines were extended north to Philadelphia and control of terminal properties on Staten Island was secured, as well as various lines in the West. Mr. Garrett resigned in 1887.

Some years later the receivership took place, after which the Garretts lost control of the property.

Silver Service for Mr. McCrea.

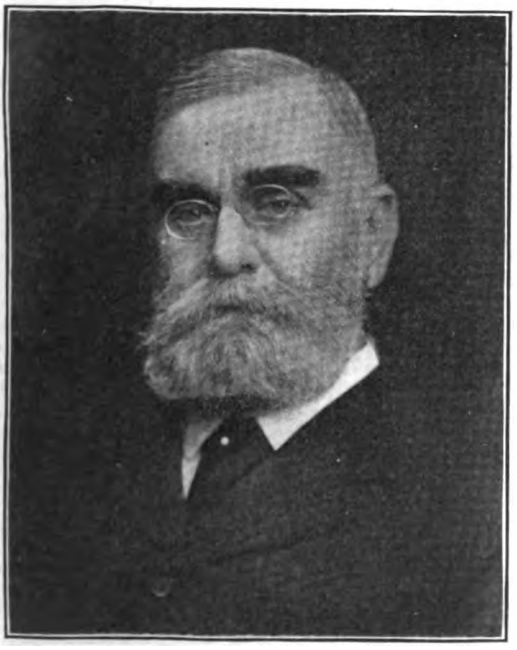
ON the last day of the old year the retiring president of the Pennsylvania Railroad, James McCrea, was presented with a service of silver by the Board of Directors of the company. Included in the service is a large platter on which is engraved resolutions passed by the Board of Directors of the company.

The resolutions set forth the career of Mr. McCrea and extol his forty-eight years' service and refer in the most complimentary way to his connection with the Pennsylvania Railroad Company from its humble beginnings to his important service at the head of the company, during the time of the greatest expansion in its history when many large undertakings were in the process of completion and when the country at large was reacting from a period of unprecedented prosperity and development. The resolutions in part continue:

"The board deem it a privilege to make this record of their profound appreciation of the able and valuable service rendered by Mr. McCrea during his unusually long term of service. From rodman to president he has served the company with signal ability and untiring zeal for its welfare. The lines West of Pittsburgh, upon which he spent about half of his active life, are a monument of his sagacious and progressive management, under which, from crude beginnings, they have been rounded into a well-knit and thoroughly organized system, profitable to their stockholders and efficiently meeting the requirements of the communities which they serve. The history of his service to the company is the testimony of its value, and the record of his achievement his title to a place among the ablest railroad executives of the country."

Benjamin F. Bush.

A REARRANGEMENT of executive and other forces of the Gould lines went into effect on January 1, and Benjamin F. Bush became president of the Missouri Pacific, Denver & Rio Grande, Iron Mountain, Western Pacific, Texas & Pacific and International & Great Northern, and J. M. Johnson, of St. Louis, was made vice-president in charge of traffic. Each subsidiary line has its individual traffic manager responsible to Vice-President Johnson. George Gould is chairman of the executive board for all the lines.



JAMES MCCREA,

Who Was Presented with a Silver Service by His Associates on the Last Day of His Active Service as President of the Pennsylvania Railroad.

BENJAMIN F. BUSH,

Whose Authority as President Has Been Extended Over the Entire Gould System.

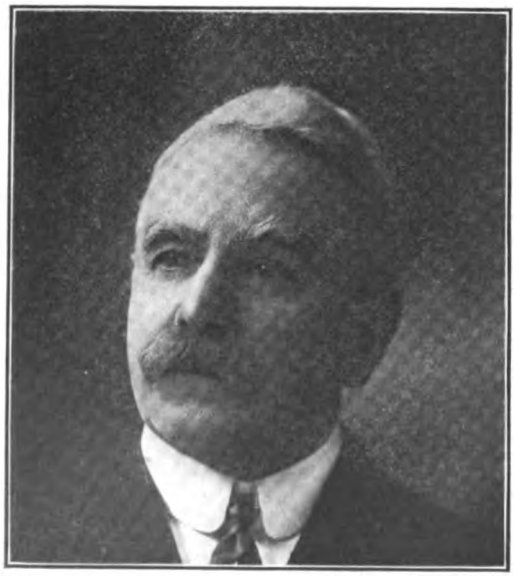
Digitized by Google

This plan puts Mr. Bush at the head of a railroad system embracing transcontinental, Gulf and Appalachian trunk lines with 13,844.12 miles of rails under his control. The next largest system is that of the New York Central Lines which has 12,817 miles of road.

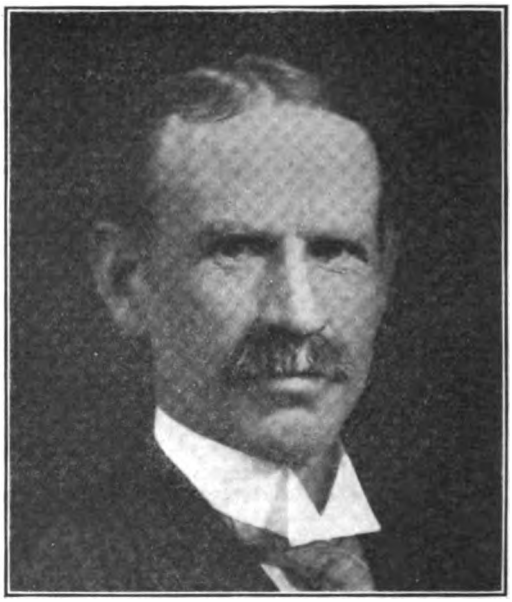
Mr. Bush was with the Gould lines as general fuel agent when he was called to the presidency of the Western Maryland and had proven his ability. He was president and later receiver of the Western Maryland, reorganizing that property.

Tilghman B. Koons.

TILGHMAN B. KOONS, recently elected vice-president of the Central Railway of New Jersey, was born May 29, 1852 at Treichlers, Pa., educated in public schools and special course of some years under Prof. Atwater, afterwards took business course in Eastman's School, Poughkeepsie, N. Y., during vacation and spare moments studied telegraphy. Entered railway service as telegraph operator D. L. & W. R. R., 1872, shortly thereafter or early in 1873 took service with Lehigh Valley R. R. as clerk in general freight agent's office, Mauch Chunk, Pa., remained with said company until 1879, when, due to impairment of health, resigned. In latter part of 1880 entered employ of Central Railroad Company of New Jersey as soliciting freight agent with headquarters at Elmira, N. Y., covering territory north and west. From 1887 to 1898 successively filled position of general agent, division freight agent and division freight and passenger agent with office at Mauch Chunk, Pa. September, 1898, assumed position of general freight agent with office 143 Liberty Street, New York. On December 23, 1902, was appointed freight traffic manager, holding this position until January 1, 1913, when elected vice-president and freight traffic manager, making continuous service with the Central Railroad of New Jersey of over 33 years.



TILGHMAN B. KOONS,



G. L. PECK,

Recently Elected Fifth Vice-President of the Pennsylvania Lines West of Pittsburgh.

George L. Peck.

George L. Peck, who on January 1st, was promoted to the newly created position of fifth vice-president of the Pennsylvania Lines West of Pittsburgh, was born July 10, 1858, at Sandusky, Ohio. His railroad service began in 1873 as a messenger boy on the Toledo Division of the Pennsylvania Company. Mr. Peck's first promotion was to the position of telegraph operator, which he held from 1874 to 1876. From the latter date to 1881 he was a train despatcher in the service of the Pennsylvania Company. From 1881 to 1882. Mr. Peck held the same position on the Columbus, Hocking Valley and Toledo Railway.

In 1882, Mr. Peck was made trainmaster on the Toledo Division of the Pennsylvania Company and from 1894 to January 15, 1896, was superintendent of the Richmond Division of the Pittsburgh, Cincinnati, Chicago and St. Louis Railway. He held the position of superintendent of the Pittsburgh Division of the same road from January 15, 1896, to January 1, 1901. when he was made general superintendent of the Southwest System of the Pennsylvania Lines West of Pittsburgh.

On June 7, 1901, Mr. Peck was promoted to the position of general manager of the Pennsylvania Lines West of Pittsburgh.

Agnew T. Dice.

AGNEW T. DICE, until recently, general manager of the Philadelphia and Reading Railway Company, on January 1, 1913, became vice-president and general manager of that company with headquarters at Reading, Penna. He was born on November 2, 1862, at Scotland, Penna., and was educated at Chambersburg Academy.

Digitized by Google

AGNEW T. DICE,
Recently Elected Vice-President of the Philadelphia and Reading Railway.

He began railway work on July 17, 1881, in the engineering and maintenance of way department of the Pennsylvania Railroad, remaining in the service of that road until January, 1892, when he went to the New York Central and Hudson River as superintendent of signals. Subsequently, he was made assistant superintendent of the Hudson Division of that road, which place he held until April 1, 1894. At that time he resigned and went to the "Reading," as superintendent of the Atlantic City Railroad. January 1, 1897, he was made assistant superintendent of the Reading Division of the Philadelphia and Reading, and February 1, 1897, was appointed superintendent of the Shamokin Division. May 1, 1903, he was promoted to general superintendent, and on January 1, 1910, was made general manager.

Mr. Dice is a member of the Conference Committee of Managers, representing Eastern railroads, now negotiating with the firemen, on the subject of wages, and of the Committee of Maintenance of the American Railway Association. He is also a member of the New York Railway Club.

J. M. Fitzgerald.

J. M. Fitzgerald, who became president of the Western Maryland Railway on January 1st, was born near Harrisburg, Pa., on April 26, 1877.

Mr. Fitzgerald received his early education in the public schools of Philadelphia. He was then admitted to the School of Technology in that city, where he took a course in civil and mining engineering.

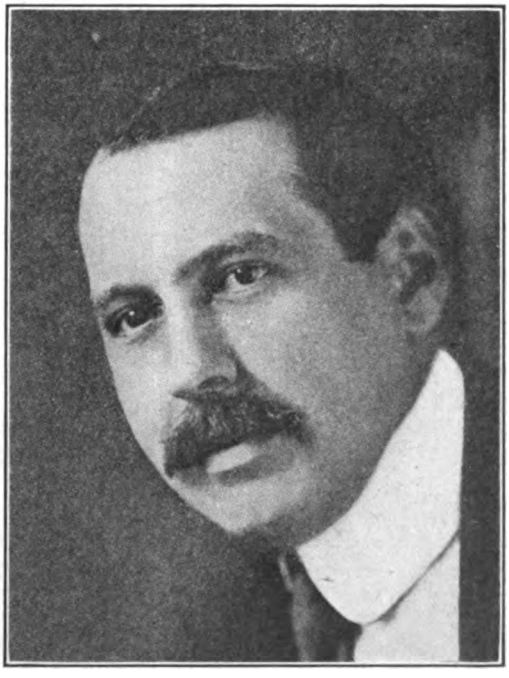
In 1894 he began his railroad career with the Columbus, Sandusky and Hocking Railroad in their general offices at Columbus, Ohio. Since then he has risen rapidly in the railway service. He was made purchasing clerk and general storekeeper in August, 1896. In March of the following year, he accepted a position with the Choctaw, Oklahoma and Gulf R. R., at South McAlester, I. T., in their engineering department, where he remained for about two years in railroad construction and maintenance of way work.

He went to Bristol, Va., in August, 1898, as assistant general manager of the Virginia and Southwestern R. R., and was given charge of the operating department. The same year he was made assistant to the vice-president of the Virginia Iron, Coal and Coke Company. In April, 1900, the mining operations of the Empire Steel and Iron Company were placed in his charge. Four years later he controlled the mining operations of B. Nicoll & Company. He was made vice-president of the Pittsburgh Terminal R. R. and Coal Company in June, 1909. On April 1, 1912, he was elected president of the Davis Coal and Coke Company. He was elected vice-president of the Western Maryland R. R. on October 16, 1912, and on November 8, 1912, was elected president to take effect January 1, 1913.

M. C. Kennedy.

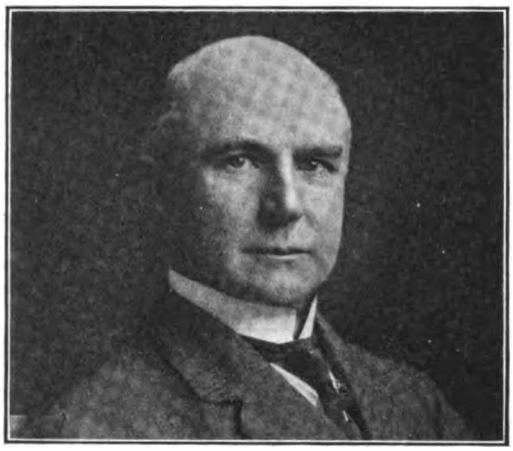
At a meeting of the directors of the Cumberland Valley Railroad Co., M. C. Kennedy was elected president and Samuel Rea was elected vice-president.

Mr. Kennedy has been vice-president and general superintendent of the company since the death of his father several years ago, who was the president of the company. Since the death of the elder Mr. Kennedy, Presidents Cassatt and McCrea have served as presidents of the Cumberland Valley.



J M. FITZGERALD,
The New President of the Western Maryland.

Digitized by Google



M. C. KENNEDY,
Who Succeeds James McCrea as President of the Cumberland Valley.

The new president, Mr. Kennedy, has been connected with the road for many years, and as vice-president and general superintendent he has conducted the company most successfully. His thorough knowledge of the property, and of the transportation requirements of the people of the Cumberland Valley and his intimate acquaintance with them fit him for his new position.

President Kennedy was born on March 10th, 1862, at Chambersburg, Pa., where he spent his early school days. In 1880 he was graduated from the scientific department of Phillips Academy of Andover, Mass., and in 1884 from the John C. Green School of Science, of Princeton University, with the degree of civil engineer. Following his graduation he went to Wyoming, where he engaged in cattle ranching on the Powder River.

In 1887, Mr. Kennedy moved to Junction City, Kansas, and organized the banking firm of Kenedy & Kennedy. He contiued in that business there until June, 1889, when he entered the service of the Cumberland Valley Railroad Company, as assistant to the president, and in 1892, was elected vice-president. On January 1, 1903, due to the largely increased traffic of the railroad, Mr. Kennedy was placed in entire charge of its operation, and in addition to his duties as vice-president, he was elected general superintendent.

Assistants for President Rea.

SAMUEL REA, the newly elected president of the Pennsylvania, has been given three additional assistants. They are A. J. County, former assistant to Mr. Rea, as vice-president, made special assistant to the president. O. J. DeRousse, chief clerk to President McCrea, appointed general assistant. Ivy L. Lee, for three years the manager of the publicity bureau of the road, elected executive assistant. These changes went into effect January 1st.

This action gives the president five assistants, as W. A. Patton and E. T. Postlethwaite are already discharging duties in that capacity. The first named has acted as an assistant to the last four presidents of that road, starting under President Roberts and remaining under Presidents Thomson, Cassatt and McCrea.

A. J. County.

Albert John County ranks among the most successful younger men who have worked their way to the front. He is a native of Dublin, Ireland, where he was born August 1, 1871. He received his early education in the schools of that city, and later, upon coming to this country, was graduated from the Wharton School of Finance, University of Pennsylvania, with the degree of Bachelor of Science in Economics. Mr. County's railroad experience began in July, 1885, with the Great Southern & Western Rail-

IVY L. LEE. A. J. COUNTY. OSWALD J. DEROUSSE.
THE THREE NEW ASSISTANTS TO PRESIDENT REA OF THE PENNSYLVANIA RAILROAD.

Digitized by Google

way Company, of Ireland, in its purchasing department.

On November 20, 1890, Mr. County entered the service of the Pennsylvania Railroad Company as clerk in the secretary's department; in June, 1898, he was appointed chief clerk, and on December 1, 1900, assistant to the secretary.

Between June 1, 1906, and May 7, 1912, he served as assistant to Vice-President Rea under the respective titles of assistant to the third vice-president, assistant to the second vice-president and assistant to the first vice-president.

On May 8, 1912, when the practice of designating the vice-presidents numerically was discontinued, Mr. County was appointed assistant to the vice-president.

Oswald J. DeRousse.

Oswald J. DeRousse was born February 18, 1867. He entered the service of the Pennsylvania Railroad Company on July 18, 1884 as a telegraph operator in the old general offices on Fourth Street. On June 28, 1885, he was transferred to the service of the New York, Philadelphia & Norfolk Railroad Company, in the office of A. J. Cassatt, where he remained until March, 1897, when he was elected secretary of that company.

Upon the election of Mr. Cassatt to the presidency of the Pennsylvania, on June 9, 1899. Mr. DeRousse was transferred to Broad Street Station and appointed chief clerk of the office of the president. He has filled this office up to the time of his present appointment.

Ivy L. Lee.

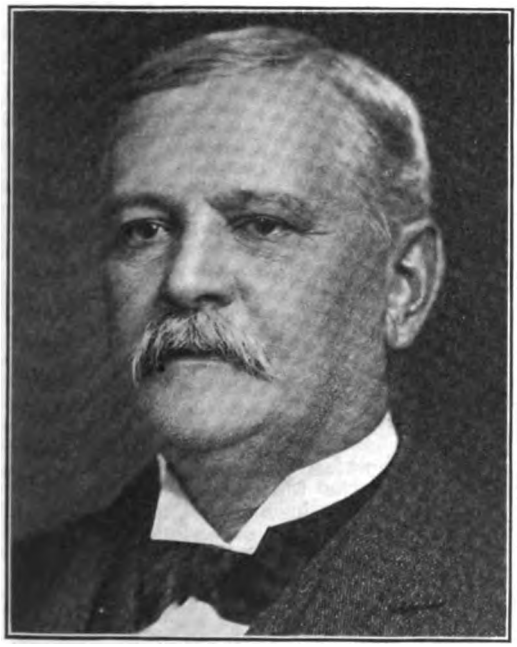
Ivy L. Lee was born at Cedartown, Georgia, July 16, 1877. He is a graduate of Princeton University and has taken post graduate work at Harvard and Columbia Universities.

For several years, Mr. Lee served on the Editorial Staff of a number of New York newspapers. From 1905 to 1907 he was the press representative for the anthracite coal operators and other corporations. In 1906-7 he had charge of the publicity for the Pennsylvania Railroad and in 1908 established the Publicity Bureau of the Company. In 1909, he resigned from the service of the Pennsylvania Railroad and became general European manager for Harris, Winthrop & Co., bankers. He returned to the Company on December 1, 1912, and was appointed executive assistant.

Obituary

Roswell Miller.

ROSWELL MILLER, who died in New York on January 3d, belonged to the older generation of railroad executives. Mr. Miller was president of the Chicago, Milwaukee & St. Paul from 1888 to 1899, and since 1899 to his death, was chairman of the board of directors. Under his management little or no new territory was developed by the St. Paul, but the property was improved, intensively developed and raised to the first rank among the best managed railroads in the west. Under his guidance the road commanded to an unusual extent the loyalty of its shippers and the traveling public. His ideals of organization were of a high character and were reflected in the discipline and service of the road. Mr. Miller was born in Hartford, Pa., on October 28, 1843. His early railroad experience was on the Cairo & Vincennes, of which he was at one time secretary and later general superintendent. In May, 1882, he was made vice-president and treasurer of the Chicago & Western Indiana. He had valuable early financial training, having worked in the office of J. P. Morgan & Co., in New York. In April, 1883, he was made assistant to the general manager of the Chicago, Milwaukee & St. Paul, and in the following year the general manager's health failed and Mr. Miller was made assistant general manager, with much of the duties and responsibilities of the general manager's office on his shoulders. In April, 1885, the general manager died and Mr. Miller succeeded him. Three years later Alexander Mitchell, president of the St. Paul, died, and Mr. Miller was elected president, retaining for two years the general managership. In 1890 a general manager was appointed who took over a part of Mr. Miller's duties; but the development of the St. Paul and the success of its management were due directly to Mr. Miller up to the time of his ill health in 1899.



ROSWELL MILLER.

The extension of the St. Paul to the Pacific Coast was in contrast to Mr. Miller's consistent policy of development of the existing property without extension during the time he was president. This Pacific Coast extension was financed through the issue of stock, and when it became evident in 1910 that the St. Paul was failing to earn the seven per cent. dividend that was being paid on the increased capitalization, Mr. Miller was one of the directors who first recognized and acquiesced in the necessity for reducing the dividend rate.

Financial

Favorable Railway Earnings.

RETURNS for November from 50 representative railroads operating in all sections of the country, with a mileage of approximately 160,000, show an increase in gross earnings of 13.2 per cent., and an increase in net earnings of 16.4 per cent. This compares with an increase in gross of 13.7 per cent., and an increase in net of 17.1 per cent. in October. All sections of the country show increased railroad earnings, the New England group of roads being the only one showing a decline.

A most encouraging return is made by the St. Paul. For the five months ending November 30th, the earnings on the common stock were approximately 6.4 per cent.; for the entire fiscal year, ending June 30th last, only about 2 per cent. was earned. For November the gain in gross earnings of the system was $1,862,063 and for the five months the increase was $7,110 327. Another company which has caused some anxiety is the Missouri Pacific. In only one month of the fiscal year ending June 30th, this company earned as high as $5,000,000 gross. In the current fiscal year there has been no month in which gross earnings did not exceed $5,000,000. The gain in gross earnings for the five months ending November is 14.1 per cent. Of this increase in gross earnings the management was able to save $2,440,000 for net earnings, as the result of more economical operation, made possible by improvements and new equipment.

The Wabash Railroad, although still in the hands of a receiver, is making an excellent showing. For December the gross revenues were $2,684,502, a gain of 10.6 per cent. The half year's gross earnings are at an annual rate of over $33,700,000, and it is reasonably certain that the earnings for the full twelve months will be largest in the history of the company.

Another company showing marked improvement is the Rock Island which begins the second half of its fiscal year with a gain in net earnings after taxes, of over $1,600,000. In view of the rumors which were in circulation nine months ago, of possible difficulty in the finances of this company, this showing is remarkable. It was made, moreover, in the face of $950,000 more spent in maintenance than during the same period of last year.

This general improvement in the condition of railroad companies which have had some difficulty in getting along during the hard times of 1911, clearly indicate the remarkable improvement in the general railroad situation. Investors are also attracted to the stocks of sound railroad companies because of the comparatively high yield which they now show at present prices. Atchison, for example, is showing 5.76 per cent. to the investor; Baltimore & Ohio, 5.71 per cent.; Northern Pacific, 5.93 per cent.; Southern Pacific, 5.71 per cent., and Union Pacific, 6.36 per cent. The dividends of these companies are well secured on the basis of current earnings. This is especially true of Union Pacific which has recently been under a cloud on account of its enforced separation from the Southern Pacific. During the last fiscal year, however, this company earned a surplus exclusive of the dividends earned from its holdings of Southern Pacific stock exceeding the 10 per cent. dividends paid to the common stockholder.

It should not be forgotten, however, that this considerable improvement in the finances of American railroads, is based upon a comparison of this year with a period of the worst operating results American railroads have experienced in ten years. The weather conditions of last winter were so extraordinary as to make serious reductions in the earnings of all railroads in the Northern States.

Large Security Issues Expected.

ACCOMPANYING this improvement in railroad earnings is the announcement of plans for large issues of securities, especially bonds. The railroad bond market has been depressed for three years. Nineteen-nine was the record year with $1,139,000 000 issued. In 1912, $682,000,000 of bonds, most of them secured by railroad property, were put out. On the other hand, the industrial corporations, which mainly rely upon preferred stock issues, have found a ready market. The total issues of stocks last year was $1,037.000,000, most of this consisting of the cumulative preferred stock of industrial corporations. Of railroad bonds, 1911 showed a decrease in issue of $163,000,000. Nineteen-twelve was also distinguished by large issues of short term notes. During the two years, 1911 and 1912, railroad corporations put out $674,000,000 of these deferred obligations, a conclusive indication of the weakness in the market for long term bonds.

According to the announced plans, the next two months will see a large amount of railroad financing. The first of these new quotations will be an issue of $63,250,000 of 4½ per cent. convertible bonds which have been authorized by the Board of Directors of the Baltimore & Ohio and which have been offered to common and preferred stockholders at 95½. The St. Paul directors have offered their stockholders the privilege of subscribing at par for about $14,000,000 of 4½ per cent. convertible bonds, and the Southern Railway has sold $5,000,000 of 5 per cent. notes.

Investing bankers have been greatly encouraged by the reception given these issues, which they are inclined to explain, in part, at least, by the popular distrust of the New York Stock Exchange. At the same time it is conceded that railroads will not soon again be able to borrow money as they have in the past, on a 4 per cent. basis. Instead the method of offering securities on preferential terms to stockholders will probably be followed, so that what the stockholder loses in higher fixed charges, he will gain in preferential subscription if he wishes to invest more capital in his company.

Railway Mergers.

NEW mergers have been announced. The option given to the Missouri Pacific on the stock of the International and Great Northern has expired but it is expected that it will be renewed. There have been reports

Digitized by Google

of a possible sale of the Michigan Central by New York Central owing to the recent decision by the Supreme Court in the Union Pacific case. This has not, however, been confirmed. The Chicago, Milwaukee & St. Paul will soon take over the entire property and assets of the Chicago, Milwaukee & Puget Sound Railroad over which it has exercised control for a number of years. The entire capital stock of the Puget Sound Railroad is owned by the St. Paul. This consolidation is effective from January 1st.

The Southern Pacific has succeeded the Atchison, Topeka & Santa Fe in control of the Northwestern Pacific. Each of these companies has an equal share of the stock of the Northwestern Pacific, and from this time on will alternate annually in its control.

The Stock Market.

THE stock market situation during January has not been satisfactory. Toward the middle of the month quotations generally declined, reaching in some cases the lowest levels of the year. The transactions were small and little outside interest was manifested. The most satisfactory explanation of the decline is found in the political situation. The utterances of the President-elect have been far from reassuring to the financial community. Wide-spread irritation, disgust and astonishment has been expressed over certain public utterances of the President-elect, notably a speech at the dinner of the Chicago Commercial Club. President-elect Wilson, in the words of the Commercial and Financial Chronicle, "thinks he has a mission to perform and that it is his duty to rescue the people of this country from the slavery of an industrial and economic system of whose hideousness and thraldom the poor people themselves in their amazing ignorance, seem to be all unconscious. With a frankness that does him credit, he admits that he knows nothing about business himself; nevertheless, he does not hesitate to stand in judgment upon business men, and he accepts as gospel truth all the false and malicious statements that the politicians have been circulating for their own selfish ends."

Governor Wilson's Corporation Bills.

IN the bills introduced in the New Jersey legislature for the further regulation of business, President-elect Wilson enters the lists against the corporations. Radical changes in the corporation act of New Jersey have been proposed in seven bills which have been sent to the New Jersey legislature at his instigation. These bills are designed to prohibit, hereafter, the formation of holding companies, the issuance of stocks not based on bona fide values, and the formation of combinations for the purpose of restraining trade, and creating monopolies.

The first of these bills defines trusts and expressly prohibits the organization of monopolies. These bills set forth in great detail the limitation of the future activities of New Jersey corporations and the conditions under which new corporations may be formed. Prison penalties are provided which make the directors of corporations ordering or doing any of the prohibited acts guilty as individuals and provides for the revocation of the charter of the offending corporation. The penalty is imprisonment not exceeding three years or a fine not exceeding one thousand dollars or both in the discretion of the court.

Another act provides that when stock is issued by a corporation in payment for property purchased, the purchasing corporation must receive in property or stock what the same is reasonably worth in money at a fair bona fide valuation. This act permits a corporation to extend its business by the purchase of property of other corporations, including the stock of such corporations. Statements of such purchases shall be filed in the office of the Secretary of State and if false in any material respect, all the officials who signed the same, or participated in making it, with knowledge, shall be guilty of a misdemeanor.

Another act provides that no corporation organized under the laws of New Jersey shall purchase, hold, sell or assign a debt created by any other corporation, nor as owner of such stock exercise any of the rights of ownership or vote on any such stock. This act does not apply to corporations already in existence.

All mergers of corporations are made subject to the decision of the Public Utilities Commission. A final amendment to the corporation law makes it a misdemeanor for any corporation, firm or persons, to discriminate between different sections, communities or cities of the State by selling any lower than that at which the same commodity is sold in another section, after due allowance for additional cost of transportation, when the intention is to secure a monopoly or drive a competitor out of business.

These bills, while formidable in appearance, are not believed to seriously threaten the prosperity of any New Jersey corporation, even if they are enacted into law, which is more than doubtful.

It is also noteworthy that the constitution of the present corporations is left unchanged. New Jersey, for a number of years, has enjoyed a monopoly of the easy incorporation of holding companies by which most of the large mergers of industrial and public utility corporations have been brought about. The aggregate capital stock of the companies incorporated in New Jersey, most of which do business with other States, according to the report of the State Board of Assessors in 1911, was nearly $8,000,000,000. The amount of tax paid to the State annually on this capital stock is $2,691,891. Many other States have since followed the example of New Jersey because of the large profits available from the amendment of their incorporation laws and it is now possible to secure substantially the same privileges in many other commonwealths.

We do not believe that the agitation against corporations of which the facts just summarized represent, in our opinion, a culmination, will much longer continue. Railroad investment has been paralyzed by agitation and regulation. It is hardly believable that the same discouraging influence will be extended over the whole field of investments. At present, however, the advocates of regulation are in the saddle and they are riding hard. It is to be hoped, in the interest of the permanent prosperity of the American people, that they are riding for a fall.

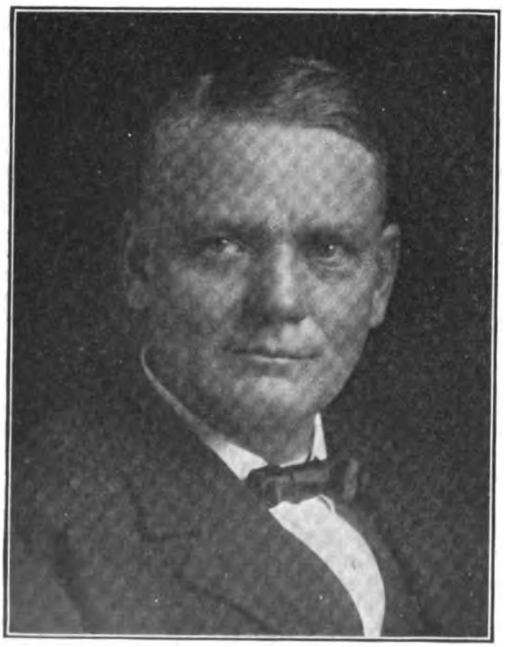
Operation

Accident Prevention.

THE prevention of accidents continues to occupy the center of the stage as the most important contemporary question in railway operation. The great amount of public attention which has of late been given to this subject, the strenuous efforts which are being made by practically every large railway system in the country to secure a reduction in accidents through greater efficiency in the operating staff, and the harsh and frequently unfair attitude of public authorities in connection with the investigation and determination of the responsibility for accidents, has been responsible for the remarkably widespread interest in the subject. The arrest of three of the officials of the New York, New Haven and Hartford for manslaughter, following a wreck on that line, and the indictment of sixteen officials in Indiana on the same ground, has brought the accident question home to railroad managers in a way which is most unpleasant. Evidently public authorities are taking the stand that in every bad accident, the railroad officials will be called upon to prove affirmatively that they have not been negligent.

While all of these movements have served to spur on the railway officials in a crusade against accidents, yet the fact remains that the "safety first" movement was started by the railways before the public had become actively interested in the question, and that to these movements must be assigned in large measure the present popular interest in the accident problem. As the Chicago and North Western remarks in its January Traffic Bulletin, "there is nothing intricate or mysterious about this movement. Officers and men merely confer intimately and informally regarding the means that seemingly might, in their judgment, be the means of protecting life or limb."



RALPH C. RICHARDS,

Who, as Chairman of the Safety Committee of the Chicago and Northwestern, has produced splendid results in the conservation of life.

The Pennsylvania Safety Rallies.

EVERYWHERE throughout the country during the last month "safety rallies" have been held on a large or small scale. One of the largest meetings was that held by the Pennsylvania Railroad on January 15th. Representatives were present from every line with which the Pennsylvania had a physical connection in the East, while the attendance of the Pennsylvania's own employes and officials was very large. Similar meetings have been held or are announced by this company in Philadelphia, Altoona, Trenton, Wilmington, Williamsport, Pittsburg and Washington, while smaller but not less important meetings will be held at the various division points within the next few weeks. The company has prepared, after careful study, a set of stereopticon views with which to illustrate the talks at these rallies, while it has under preparation a booklet which is to be placed in the hands of every one of its 85,000 employes pointing out the methods by which railroad safety can be secured and driving home the truth that the accomplishment of safety depends largely upon the responsibility and carefulness of each individual employe.

One of the most important rallies heretofore held was that conducted at Buffalo. This gathering was composed of officials and employes of the New York Central, the Lake Shore, the Michigan Central, the Pennsylvania, the Lackawanna, Lehigh Valley and the Wabash systems.

Recent Innovations in Safety Work.

THE St. Louis and Chicago Railroad Company has invited its women employes and the widows and daughters of deceased employes to enter a competition in which prizes will be given for the best letter on the "safety first" subject. The Baltimore and Ohio has made arrangements to have its General Claim Agent deliver a lecture at each division point of the system which will be illustrated by stereopticon views showing the actual conditions under which employes work in busy terminals, on trains and in shops; the mistakes which employes constantly make and which lead to accidents; the working of numerous safety devices which have been installed by the company, and some of the methods by which employes can contribute to increased safety for themselves and their fellow workmen. On January 25th, the General Claim Agent of the Baltimore and Ohio delivered a lecture by invitation at Decatur, Illinois, before the employes of the Cincinnati, Hamilton and Dayton, the Vandalia and the Illinois Central railroads within traveling distance of this point.

The Denver and Rio Grande has arranged for a series of monthly meetings over the entire system. For this purpose the system has been divided into four divisions, at each of which, for seven days in each month, lectures and demonstrations will be given, the plan being that the demonstration will be given daily at some point on the division during that week. In addition, the Safety Committee of the company has prepared a book to be used in reporting defects or

Digitized by Google

dangerous practices. A copy of this book is to be given to each committee-man who will report in it such defects as he may discover or as may be brought to his attention, at the same time making entry upon the stub of just what is reported on the page. In this way, the committeeman will have a duplicate of his report and will be able to follow up the outcome of his suggestions. The way in which the book can be of assistance in promoting the work of the committeeman is set forth in a series of rules which are printed in the back for the guidance of the committee-men. In addition, the company has adopted a postal card form, the cards being placed at the various stations. Employes are requested to use them for reporting defects or dangerous practices that may come to their attention. Space is provided on the card for the report of the chairman on the suggestion contained therein.

The Pere Marquette has issued a statement which declares that clumsiness on the part of employes will not be tolerated hereafter, and that men persistently guilty of this fault will be discharged. This summary action is taken because the company is convinced that a large proportion of accidents are due to clumsiness on the part of employes who are not naturally fitted for railway service and who should, in the interest of the public and their fellow workmen, be eliminated as soon as possible.

Growing Public Appreciation of the Slow Speed Train.

ONE of the most significant results of the "safety first" campaign has been the growth in the proportion of railway travelers who desire to travel on trains which will operate at conservative speeds, even though a longer period of time is required for their journey. The Titanic accident resulted in the sudden popularity of the slow speed liner which did not seek to make a record but rather to operate in a cautious manner. One of the Eastern trunk line railroads, in advertising a luxuriously equipped train makes the significant statement that the train "runs at comparatively low speed." This train, which has every modern convenience, would a few years ago have been run on as rapid a schedule as conditions would possibly permit. It is to be hoped that we are developing a class of travelers who prefer safety and comfort to excessive speed.

Official Report on Lackawanna Collision.

THE official report of the New York Public Service Commission for the Second District, on the rear collision which occurred on the Lackawanna line at Corning, New York, on July 4th last, has been made public. The report finds that the accident was due to the failure of the engineer on the second train to observe the signal given him by the flagman of the preceding train. It was found that the flagman had gone back a sufficient distance, but that he had violated the rules by failing to take torpedoes with him, although the testimony indicated that the weather was sufficiently clear to justify him in refraining from the use of the torpedoes under the company's rules that they should not be used in block signal territory except in foggy or stormy weather. The Commission recommends that the rules should be amended so as to give the flagman liberty to use torpedoes in such territory whenever any doubt or special danger appeared to exist. The Commission takes occasion to emphasize the fact that no permanent safety can be expected until railroad employes recognize the importance of their duties and the need of constant care in every detail of their work. The Commission advocated the necessity of stricter discipline and the summary removal of men from the service who fail to meet a reasonable standard of performance of duty in matters involving safety. The report recommends the use of steel cars or of wooden cars with steel underframes, especially on high speed trains.

Report on English Railway Accident.

THE railroad officials of this country are not the only ones who have to deal with investigating commissions looking into the causes of accidents or wrecks. A very elaborate report has recently been submitted to Parliament on the wreck which occurred on the London and South Western on September 17th last. While there is little in this report which would be suggestive to railroad officials as to means of preventing accidents in this country, yet it is interesting as showing the difference in the English and American methods of making such an investigation. Instead of an attempt to make capital out of the accident through extravagantly worded comments on the causes and possible means of preventing the accident, the English report is calm and judicial in its tone, fair to both sides, presenting the testimony as it has found it and leaving the conclusions to be summed up in the portion of the report where they can properly appear, rather than having them interspersed throughout the evidence.

The Month's Accident Record.

IT is a source of gratification to be able to report that the number of accidents resulting in heavy casualties during the month has been quite small. The most serious wreck was that which occurred on the Chesapeake and Ohio on the first day of the new year. An engine of the heaviest type, pulling a freight train westbound, plunged through a temporary bridge spanning the Guyan River at Wyandotte, West Virginia, resulting in the death of seven employes and the injury of five others. The financial loss to the company is estimated at one and a half million dollars, The bridge which proved faulty was, at the time, under repair. The preliminary investigation of the company seemed to indicate that the disaster was caused by the collapse of the piling, through having been undermined by the high water then prevailing.

A most peculiar accident occurred on the Vandalia Railroad on January 8th. While one of its passenger trains was standing in the Union Station at Terre Haute, an eastbound train crashed into the rear end of it, telescoping the day coach of the standing train and the combination smoker and baggage car, resulting in the death of two passengers and the injury of fourteen. The cause of the accident is ascribed to the disregard of signals by the engineer of the second train.

Another accident of a very similar character was that occurring at Hyattsville, Md., on December 28th, when a passenger train of the Chesapeake Beach Railroad Company crashed head-on into a Baltimore and Ohio coal train at a junction point. Five employes were injured.

The final accident of importance occurring dur-

Digitized by Google

ing the month, resulting in loss of life, was the collision of a Washington, Baltimore and Annapolis electric interurban car with a freight train at Annapolis, Md. Two employes were injured.

Interstate Commerce Commission Accident Bulletin.

ACCIDENT BULLETIN No. 44, covering the three months ending June 30, 1912, has been issued by the Interstate Commerce Commission. In addition to the statistics compiled in the customary manner, showing the causes of accidents, the number killed or injured, and the character of the injury, the Commission gives the results of the investigation made by its Chief Inspector of Safety Appliances of a number of accidents occurring during the period under review. A review of the findings of the Commission concerning the causes of fifteen accidents investigated shows that two were caused by broken rails; one by the spreading of the rails on a curve, due to excessive speed; one was due to a faulty switch; one was the result of soft and uneven track, leading to the derailment of the train, while the balance were due to the failure of employes to obey rules or miscellaneous unavoidable failure of mechanical appliances.

In connection with its investigation of the wreck on the New York, Chicago and St. Louis, occurring on June 22, 1912, the Commission condemns the practice of running fast trains only five minutes apart, contending that trains should be spaced far enough apart to give the flagman ample time to protect against the following train whenever a stop is made for any purpose.

Trespassing on Railway Rights of Way.

IN twenty years, 86,733 persons have been killed and 94,646 injured while trespassing on railroad tracks. This astonishing showing is used by the sub-committee on Rules of Railway Operation and Legislation in its report on "Trespassing on Railway Rights of Way," recently issued. The Committee concurs heartily with the conclusion previously expressed by Commissioner McChord of the Interstate Commerce Commission that trespassing on railway property is due largely to inefficient local government. Although over five thousand people are killed every year as a result of this practice, there are very few states in which the legislatures have seen fit to enact statutes forbidding such trespassing, while in many of the states where such laws are in existence, they are practically dead letters. The Committee points out that fourteen people are killed daily as the result of trespassing; that the greatest number of passengers ever killed in a single year from all causes was in 1907, when they equalled 610. In that year the number of trespassers killed was 5,612, or over nine times the number of passengers. In 1911, the last year for which the Committee found complete statistics were available, there were fifteen times as many trespassers as passengers killed. (According to the report of the Interstate Commerce Commission for the year ending June 30, 1912, 53.3 per cent of the total number of persons killed on railways were trespassers.) The Committee closes its bulletin by stating the fact that forty-one legislatures are meeting during the present winter, and advocates strongly that strenuous efforts be made to have each legislature pass a law making it a misdemeanor to trespass on railroad property.

Necessity for Automatic Train Control not Established.

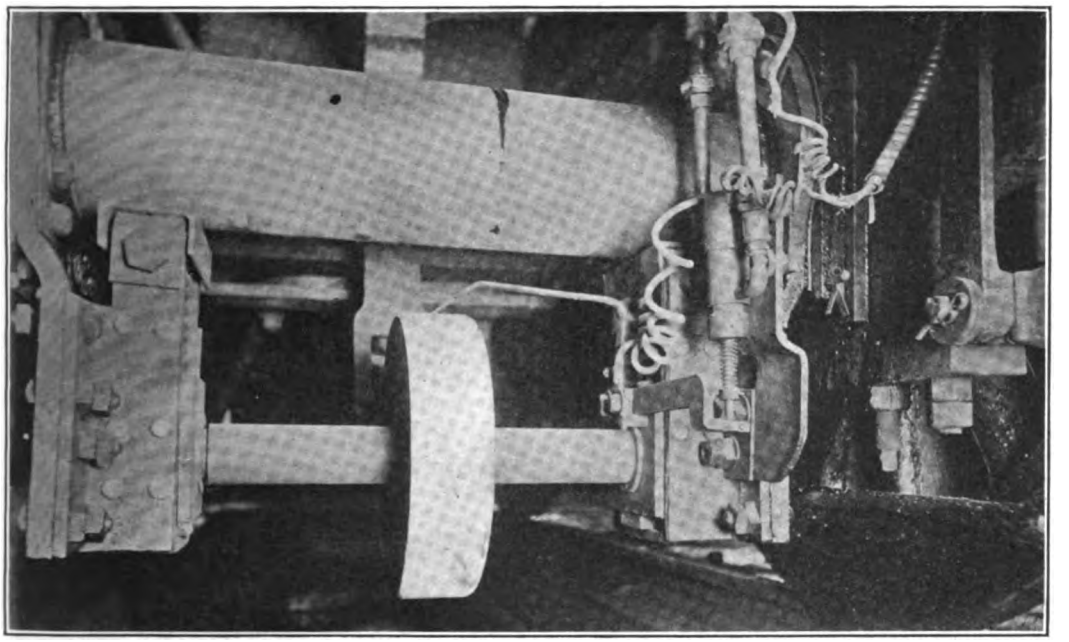
IN connection with the question of accidents, the opinion expressed by Mr. D. F. Jurgenson, Engineer of the Minnesota Railway and Warehouse Commission in a paper submitted as the report on the Committee on Safety Appliances to the National Association of Railway Commissioners, that the necessity for automatic train control has not been established, is interesting. He believes that before such a step is taken it is necessary to exhaust all means of prevention, especially in the direction of eliminating individual errors in train operation. At best, the automatic train control device would be only an auxiliary to, and of secondary importance to the signal system. The device is likely to make the employe careless of the responsibilities which he must assume. Mechanical devices are not error-proof, and failures occur even in the best signal systems. Automatic train control could not be relied upon implicitly, and it is necessary to depend, even with it, upon human responsibility. Mr. Jurgenson further believes that we in this country should follow the example of Germany and other European countries by making railway employes amenable to the State for faithful attendance to the performance of their duties. The responsibilities of employes should be equal to that which the State now enforces upon practitioners of medicine, lawyers and other professional classes, and punishment should be dealt out for carelessness or incompetency.

Interesting Experiments with Automatic Control

ALMOST interesting series of tests was recently made upon the Huntingdon and Broad Top Mountain Railroad and Coal Company, with the automatic system of train control manufactured by the Safety Block Signal Company. The general outlines of this train control device is shown in the accompanying illustrations. In brief, the device consists of an electrically charged rail secured to the track just inside of the block protected by the automatic signal The locomotives are equipped with a wheel which comes in contact with this rail. When

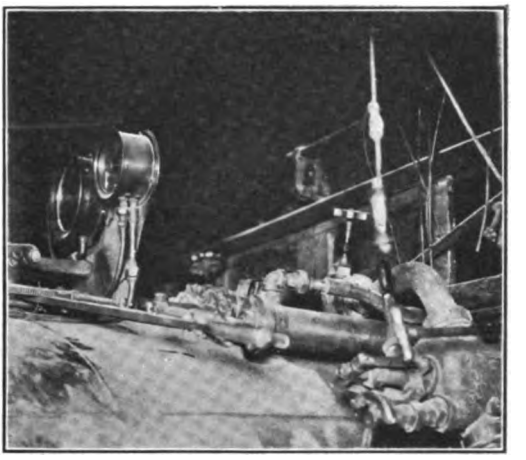
LOCATION OF CONTACT RAIL BACK OF SIGNAL.

Digitized by Google



CONTACT WHEEL, MECHANICALLY ACTUATED VALVE AND CIRCUIT CONTROLLING DEVICE.

the rail is not charged, as is the case when the block signal is at "danger," the rail electrically and mechanically trips a valve which admits air to the cylinder, closing the throttle of the locomotive and applying the air brakes. When the contact rail is electrically charged, the device does not operate, permitting the train to continue into the next block. The first test which was made with this device was to determine its efficacy in preventing rear-end and head-on collisions. A locomotive was stood in a block and another locomotive was run by a danger signal into the block already occupied. The automatic device successfully stopped the oncoming locomotive within a short distance. Following this test, two engines each drawing two cars were started towards each other in separate blocks. As each engine struck the safety rail on entering the intervening block, the throttles were automatically closed and the trains brought to a standstill. The third test consisted in opening a side switch from a main track within a block and then running a train past the danger signal which had thereby been set into the block. Again the automatic train control proved effective and the train was stopped.



THROTTLE CONTROLLING CYLINDER.

Pullman Service on New Haven System.

ANNOUNCEMENT has been made by the New York, New Haven and Hartford of the transfer of its Pullman and sleeping car service to the Pullman Car Company, under a contract dated January 1, 1913, running for twenty years. Under this contract it is understood that the Pullman Company will take over the Pullman sleeping cars owned by the New Haven line, making proper compensation therefor, and will introduce steel cars on through limited trains. All of the employes of the New Haven's Pullman car service will be retained, their pay and relative positions being unchanged. The conversion to steel Pullman equipment is in line with the recent recommendation of the Interstate Commerce Commission to the New Haven road, following the investigation of the disastrous accidents of last year.

Shippers Request Railroads to Furnish Clean Cars.

THE Committee on Transportation Instrumentalities of the National Industrial Traffic League has requested the railroads of the country to inaugurate a system by which shippers will be insured under all conditions that cars placed upon their sidings will be free from de-

Digitized by Google

bris. The Committee recognizes in its recommendation that the fault of which they complain is due to the carelessness or negligence of consignees of a previous shipment in leaving refuse in the cars. The League in its report urges its members and freight shippers generally to clean out cars thoroughly after unloading so that they will be in good condition for subsequent use. The Committee believes that strict attention to this matter would lead to a considerable reduction in damage claims against railroads by shippers for loss of freight in transit by reason of unclean cars.

Handling Claims on the Frisco System.

THE officials of the St. Louis and San Francisco Railroad are enthusiastic over the results secured in the recent change which was made in the method of handling loss and damage claims. Some months ago the handling of loss and damage claims was put entirely in the hands of the operating department. Each station agent was empowered to settle the claims of his own district up to fifty dollars, irrespective of station receipts. Claims up to five hundred dollars could be settled by the station agent by communicating the details to the Assistant General Manager and receiving his endorsement to the proposed adjustment. Station agents were recommended, where differences of opinion existed as to the value of the claim, to have the matter arbitrated on the spot by a disinterested person satisfactory to the claimant and the station agent. This method has been very popular with the shippers who have thereby been able to secure prompt action upon their claims, and the company is very much gratified over the material reduction which has been made in the amount required to settle damage claims.

Increase in the Number of Idle Cars.

AS contrasted with the shortage in the car supply, which was a matter of concern to the railway companies in December, the report of the American Railway Association shows that on December 31, 1912, there were 17,058 idle cars, while the report of January 15th placed the number of idle cars at 28,549. At the date of the last report, there is no shortage of any kinds of cars, even the supply of box cars, in which the greatest deficiency existed, showing now a small surplus. By contrasting the situation of the present time with that of a year ago, the degree to which business has improved is clearly apparent. On January 3, 1912, there were over 135,000 idle cars. The largest increase in the number of idle available cars occurred in the Eastern States and in the Middle West.

Freight Car Tactics.

ARTHUR HALE, in a paper read before the Central Railway Club on January 9th, made some interesting comments upon the subject of freight car tactics and the way in which railroad companies might improve the efficiency of their combined equipment. He strongly condemned the practice of distributing roads of using the cars of their neighbors in their own business, and pointed out the justification which such a practice gives to the injured road to declare an embargo against the offender,—as was done recently by the Illinois Central against the Missouri Pacific. Mr. Hale made some interesting comments upon the current situation. He declared that it was yet too early to say what would be the result of increasing the per diem rate to 45 cents. He declared that the difficulty of such a high rate, if enforced all year round, is that it would hasten the movement of cars much more in periods of car surplus than in periods of car shortage, and there was no real reason why empty cars should move very fast when there was an over-supply of equipment. He believed that the solution of the matter would come through the appointment of a powerful commission, as a part of the American Railway Association, which should have large discretionary powers, including the right to fine roads which had injured others by misusing cars. He commented with approval upon the work of the commission recently appointed by the executive committee of the American Railway Association to handle this matter and urged the further adoption by railroad presidents of the plan agreed to by practically all of the lines entering into Chicago to the effect that empty foreign coal cars shall be handled promptly, even in preference to slow freight.

Northern Pacific Establishes Bureau of Efficiency.

ANNOUNCEMENT was made on January 16th that the Northern Pacific had established a Bureau of Efficiency under the jurisdiction of the Operating Department, in charge of the third vice-president. The Bureau, whose headquarters will be at St. Paul, will be under the direct charge of Mr. Charles T. Banks. The purpose of the Bureau, as announced, is to promote the welfare of patrons and employes of the company, to effect greater economy in operation, to raise the standard of individual and department work, and, through closer co-ordination, to bring about a greater degree of dispatch and safety in the performance of the company's business. The plan provides that the superintendent of each division shall act as the local representative, to whom employes will offer suggestions and report conditions and practices affecting the efficiency of the service. Employes are requested to confer frequently with the Superintendent on all subjects coming within the scope of the Bureau and make suggestions for the improvement of the service or working conditions as they now exist.

Pennsylvania Places Record Car Order.

ANNOUNCEMENT has been made by the Pennsylvania Railroad Company that $16,000,000 will be expended at once in the purchase of freight equipment. This sum is the largest amount which has ever been expended in a single order by an American railroad for such purpose. The action on the part of the Pennsylvania management is based upon "a belief in the continued growth of traffic along this line and to provide for its prompt and efficient handling." The placing of such a large order is concrete evidence of the confidence of the Pennsylvania management in the permanence and further growth of industrial prosperity. Orders are to be placed at once for 10,000 cars, representing additions to the system's equipment and for 2,300 cars representing replacements. In the case of the replacements, the new cars will be of 100,000 pounds capacity, whereas the worn out cars had an average capacity of only 60,000 pounds. The net

Digitized by Google

result will be an increase in the carrying capacity of the company of about 40,000 pounds per car, which, if added to the additions, will amount to a net increase of 546,000 tons in the carrying capacity of the company. The lines east of Pittsburg will receive 500 steel gondola cars, 1,300 wooden side gondola cars and 1,000 refrigerator cars, while the lines west of Pittsburgh will receive 3,000 steel gondolas, 1,000 wooden side gondolas, 500 refrigerator and 500 box cars. It is expected that the gondola cars will cost about $1,200 each, the refrigerator cars $2,000 each, and the box cars $1,300 each. During the four years from 1909 to 1912, inclusive, the Pennsylvania system has added to its freight equipment a net increase of 1,809,300 tons of carrying capacity. When the new equipment is received, the company will have approximately 275,000 freight cars.

Frisco Operating Results.

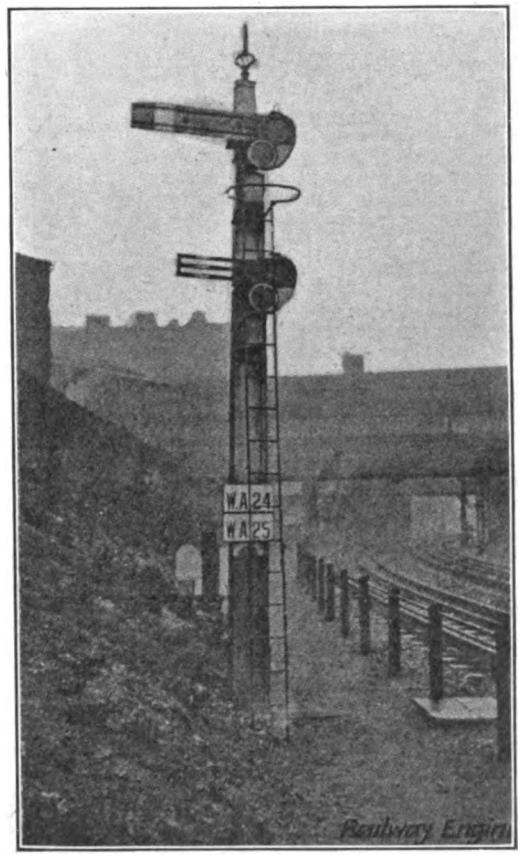
THE St. Louis and San Francisco Railroad has made an interesting comparison of the efficiency of its operating results of the year ending June 30, 1912, with the year ending June 30, 1905. The comparison shows a 30 per cent increase in freight traffic as compared with a decrease of 8 per cent in train mileage; while the earnings per ton per mile increased less than 1 per cent, the gross earnings per freight train mile increased 29½ per cent. The potential tractive effort per locomotive increased 13 per cent in the seven years, while the average train load increased 32 per cent.

Southwestern Roads Changing from Oil to Coal.

THE rapid increase in the price of fuel oil in the Southwest threatens to lead to the abandonment of this fuel by the railroads of this section. The St. Louis and San Francisco, the Rock Island, the Atchison, the Southern Pacific, and the International and the Great Northern have made more or less extensive use of oil in the last few years. These roads were induced to take up oil when the price was around 33 cents a barrel. While a large investment was required to change from coal to oil, yet the economy to be effected with oil at that price was so great as to warrant the alterations. Since that time, the price of oil has advanced to 83 cents a barrel, and it is not certain that the end is yet in sight. At the rate of 3½ barrels of oil as equivalent to one ton of coal, the economy from oil fuel has almost wholly, if not entirely, disappeared. As contrasted with the sharp advance in the price of oil, the tendency of coal prices in Arkansas and Oklahoma has been downward. The reduction in the purchase of coal by the railroads led to a depression in the coal industry in these States, resulting in a decrease in the production of bituminous coal amounting to 25 per cent, as contrasted with an increase of 40 per cent in production in other sections of the country. It is reported that the Atchison has bought a group of mines in Oklahoma, and that other railroads are either negotiating for the purchase of mines or for long term coal purchase contracts with a view of curtailing the number of locomotives using oil fuel.

Interesting Signal Development on English Railways.

THE headway of trains on the Metropolitan District railway is so close that it is very difficult to devise a block signal system with sections sufficiently short as to permit of the expeditious movement of the required number of units. In order to increase the capacity of the railway, "calling-on" arms have been introduced. The general appearance of these arms is shown in the accompanying illustration. By the use of these arms, a train can be permitted to go forward towards an obstruction after it has been brought to a stand, the driver understanding, because the arm is set at danger against him, that he is entering an occupied section. By allowing the train to proceed in this manner, the section which has just been left is rendered free, allowing a second train to enter. Practically, this method permits of the saving of a section and of a considerable delay to the following train. The practical working of this system will be watched with interest by American signal engineers.



CALLING-ON ARM, METROPOLITAN DISTRICT RY.

Rock Island & Illinois Central Campaigns and a Fuel Economy.

THE Illinois Central Railroad has resorted to the use of moving pictures to demonstrate the possibilities of economy in the use of fuel. An instruction car fitted up for this purpose is being taken over the lines of the system, stops being made at every division point,

Digitized by Google

where lectures are given morning, afternoon and evening. Engineers, firemen and other employes in the train service are invited to be present and obtain the benefit of the lectures and pictures. The pictures show samples of the work of competent and incompetent firemen, the lectures consisting of comments upon the difference in the right and wrong method as illustrated by the pictures.

The Superintendent of Locomotive Operation of the Rock Island lines has appointed four supervisors of locomotive operation, to have headquarters at different points on the system, who will have charge of the mechanical operation of all engines in service on their respective divisions and who will be expected to bring about economies in the use of fuel, lubricating material, tools and other supplies. Efforts will also be directed towards reducing the cost of maintenance of locomotives and other operating costs through improvements which may be brought about as a result of better supervision and instruction of enginemen.

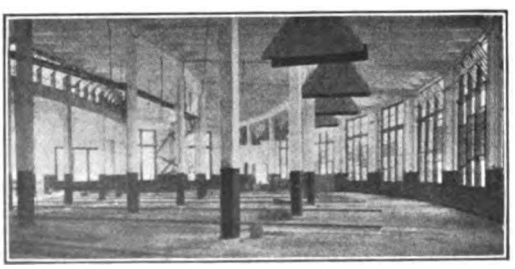
The Financial Problem of Railway Terminals.

A VERY small proportion of railway men realize the tremendous investment which railroads have made in recent years in passenger terminal properties, and the financial problems which incidentally arise. Mr. L. C. Fritch, Chief Engineer of the Chicago Great Western, in a paper on Railway Terminals read before the Canadian Railway Club on January 14th, presents this problem in a most interesting fashion. After pointing out the necessity for good terminals, which to a large degree, influence a road's traffic, Mr. Fritch calls attention to the enormous investment which has been made within recent years. He cited the New York Central's terminal in New York City, which will probably cost $200,000,000; the Pennsylvania's investment of $113,000,000 in the same city; the Chicago and North Western's terminal in Chicago, costing $30,000,000; the joint terminal in Washington representing an investment of $178,000,000; and the Kansas City joint terminal which it is estimated will cost $45,000,000, as recent examples of tremendous expenditures. He pointed out that the New York Central's terminal would represent 2,000 miles of double track road at $100,000 per mile, while the Pennsylvania's terminals in New York, Philadelphia, Baltimore and Washington represent an average of nearly $800,000 per mile of road for the 223 miles from Washington to New York. Mr. Fritch then proceeded to calculate the fixed charges, including the operating cost, of the large terminals which he cited, comparing the result with the volume of business passing through these terminals and showing what proportion the fixed charges bore to the business originating in the terminal. His conclusion was that the fixed charges of the New York Central and the New Haven on the New York terminal were equal to 80 per cent of the gross passenger receipts accruing to these lines on New York City traffic, and that the fixed charges, depreciation and operating expenses of the Pennsylvania's terminal in New York were equal to the entire gross receipts from the passenger traffic on the Pennsylvania's lines originating in and around New York City, while the cost of operating the Chicago and North Western in Chicago equals 65 per cent of the gross passenger revenue originating at that point. Mr. Fritch cited in connection with the cost of terminal service in freight work, the recent statement of a prominent railway executive that the terminal expenses of his line in freight service to Chicago averaged $21 per car. Mr. Fritch advocated a joint terminal and common ownership of railway lines in Chicago.

Increase in Block Signal Mileage.

ACCORDING to the *Railway Age Gazette*, the year 1912 witnessed the installation of automatic block signals on over 1,900 miles of additional roadway. This brings the total of mileage protected in this manner up to 23,236 miles. To this should be added 55,715 miles protected by manual signals. In a sense, the extension of automatic block signals is disappointing, aggregating only a 10 per cent increase for the year. When, however, the condition of the security market is considered and the financial showing of the railroads is taken into consideration, the result is most gratifying. The growth of the mileage of the manually operated signals cannot be definitely foretold at this time. It is certain that the ratio of growth equalled and in all probability exceeded that for automatic signals. The greater proportion of our railways are not in a position which would warrant the enormous expenditure involved in installing an entire automatic system, and with the light traffic on single track lines, the advantages would not warrant such an investment. Thus, the total of block and manual signal mileage increases but slowly. It, however, includes practically all the lines where great density of traffic prevails, and with permanent industrial prosperity and better financial conditions for the railroads, it is reasonable to presume that greater extension in this mileage will occur.

Mechanical



SANTA FE CONCRETE ROUNDHOUSE AT RIVER BANK CAL.

New Construction Methods in Concrete Roundhouses.

THE Santa Fe system has recently completed a roundhouse at River Bank, California, in the construction of which many unique features in the use of concrete by railroads were incorporated. For a number of years, factories, warehouses and grain elevators have been built on the unit plan, by which, instead of pouring the concrete in place upon an expensive system of forms, it is cast into blocks on the ground in a number of moulds. This plan was successfully followed by the Santa Fe in connection with this work. The blocks were elevated from the moulds

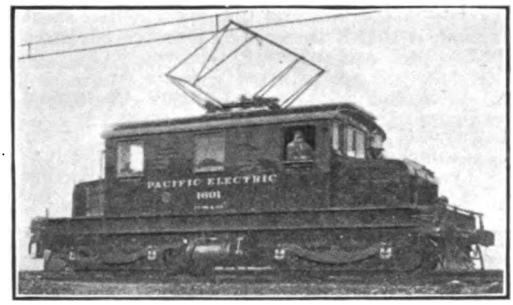
ELECTRIC LOCOMOTIVES FOR THE SOUTHERN PACIFIC.

THE Southern Pacific system recently ordered fifteen 60-ton electric locomotives for use in freight and switch service on their electrified lines in California. The first of these locomotives has just been completed and delivered. The general appearance of the locomotives is shown in the accompanying illustration. The locomotives are capable of a tractive effort of 5,600 pounds with natural ventilation of the motors, and of 11,520 pounds with forced ventilation. The locomotives are equipped in accordance with the trunk line practice, the mechanical parts having been built by the Baldwin Locomotive Works and the electrical apparatus by the Westinghouse Company.



SOUTHERN PACIFIC ELECTRIC LOCOMOTIVE.

CHROME-VANADIUM DRIVING WHEEL TIRES.

MOST encouraging results have been secured in a recent test under actual operating conditions with chrome-vanadium driving wheel tires. These tires were applied to a Pacific type of locomotive of a total weight of 228,500 pounds, of which 150,000 was carried on the drivers. This locomotive was operated on a division having numerous curves ranging from 3 to 15 degrees curvature. The new tires, after an engine mileage of 121,000 miles were found to be in good condition, whereas a sister engine in identical service, equipped with carbon steel tires gave a mileage of only 60,040 before the tires had to be turned. The accompanying illustration shows a chrome-vanadium tire which had been subjected to a drop test in the plant of the Midvale Steel Company. The specifications called for a deflection of 3 11-16 inches, whereas the total deflection obtained was five inches. A microscopic examination of the metal in the new type of tire as contrasted with the carbon steel tire shows that the former has a much closer grain, which explains to a large degree the unusual results secured in operation.

ZINC CHLORIDE vs. CREOSOTE TIE PRESERVATIVES.

ONE of the most interesting papers presented before the convention of the American Wood Preservers' Association held in Chicago on January 21st, was that read by Mr. Weiss, Assistant Director of the Forest Products Laboratory, Madison, Wisconsin, on "A Comparison of Zinc Chloride with Coal Tar Creosote for Preserving Cross Ties." Mr. Weiss points out that the number of zinc chloride treated ties has remained stationary in the last five years, while the number of creosoted ties has more than trebled in this period. This comparison shows the relative popularity of the two methods, and Mr. Weiss finds that from a scientific standpoint, the judgment of the tie users is sound. Judged from almost every point of view, the coal tar creosote is the more desirable preservative. It does not leach from the wood after the tie is put into service as does its competitor; it is less corrosive than zinc chloride; it does not lend itself readily to current leakage, where electric currents are used; it is easy to test the extent of penetration, which cannot be said of zinc chloride, and, finally, gives a much longer life—about five years—than ties treated by the other method. Against these advantages, coal tar creosote has certain disadvantages as compared with zinc chloride. It is more difficult to secure satisfactory penetration into the tie; it is subject to wider variations in composition in use; it is less resistent to the action of fire than zinc treated wood; it is more difficult to handle than zinc chloride, and represents a higher initial cost of about 30 cents per tie than the other method. These disadvantages, however, are more than outweighed by the greater practical importance of the advantages already enumerated. Mr. Weiss' conclusions can be summarized as follows:

(1) That both methods of tie preservation are effective and that there is little choice between them so far as handling charges are concerned.

(2) That creosoted ties cost from two to three times as much for treatment as burnettized ties.

(3) That creosoted ties last on an average longer in the track than burnettized ties, and

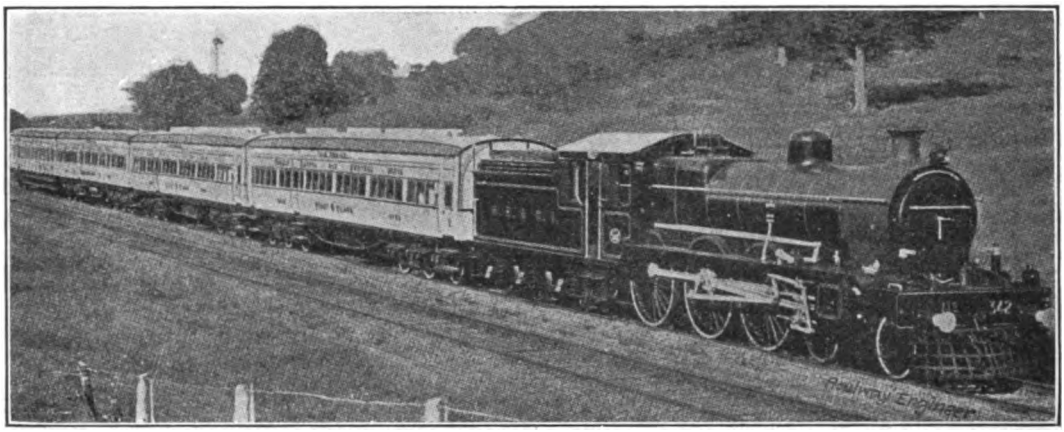
Digitized by Google

hence require less frequent renewals and changes in the roadbed.

(4) His final point, and the one which is most important, is that if the cost of creosote advances appreciably in price it will probably result in stimulating the output in the number of ties treated with zinc chloride, and stunt the production of coal tar creosoted ties.

LUXURY IN INDIAN PASSENGER SERVICE.

RAILWAY men will be interested in the accompanying illustrations showing the luxurious equipment operated in connection with the service between Bombay and Delhi, India, which are herewith produced from the *Railway Engineer*. This train is operated as a weekly boat express in connection with the P. and O. mail steamers. The train, as ordinarily constituted, consists of two first class corridor carriages, one restaurant car and one third class car. As can be judged from the accompaying illustrations, the interior fittings are of the most luxurious character, comparing most favorably with the latest types of car in use in this country.



P. AND O. BOAT EXPRESS, RUNNING BETWEEN BOMBAY AND DELHI, INDIA.

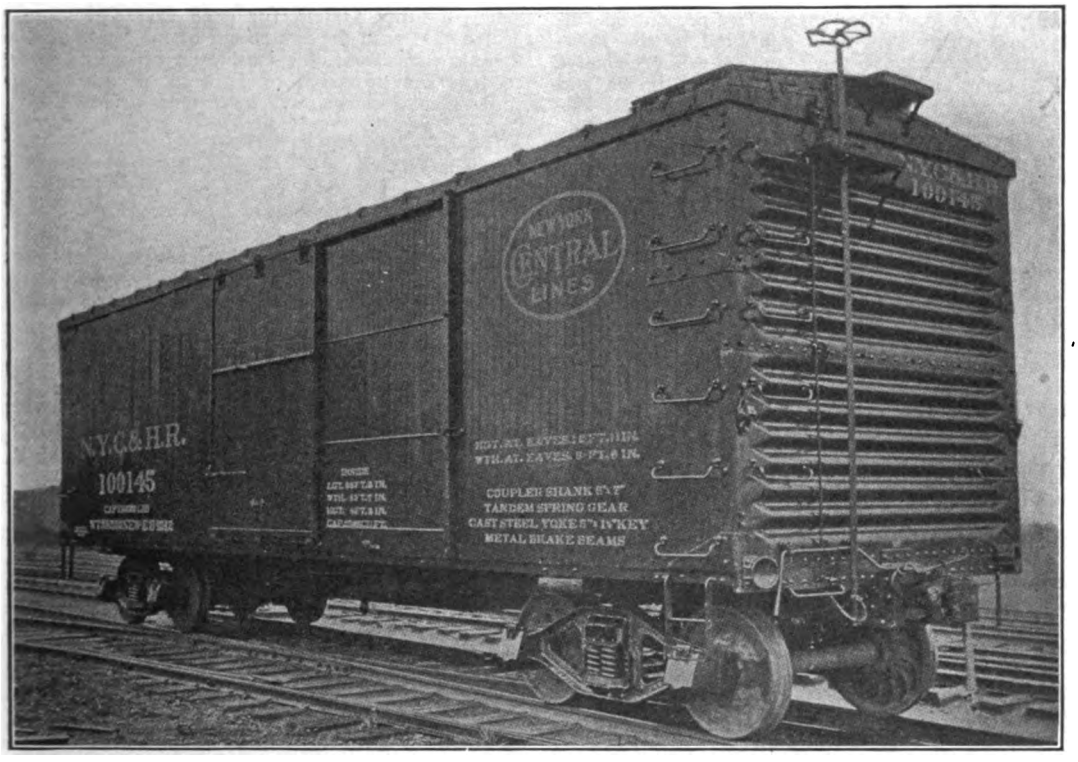
STEEL END FOR BOX CARS.

A NEW type of car end has recently been evolved and is under trial on the New York Central system. The outward appearance of the new type of end is shown in the accompanying illustration. The New York Central system has been endeavoring to eliminate the losses due to weak ends by heavy reinforcement of the wooden ends, but these efforts have not been entirely satisfactory. Accordingly, the steel end was devised and has been placed on several hundred cars. The results thus far secured are most gratifying. Its greater strength as compared with the wooden end prevents damage to the car and its contents because of shifting loads in transit. The steel end construction is lighter than the standard wooden construction by over 250 pounds, while the elimination of end posts increases the inside length of the car by about one foot. As will be seen, the end is made in two parts, facilitating the work of erection where crane facilities are not available and also the repair of the end in case of accident.



STEEL END APPLIED TO A NEW YORK CENTRAL WOODEN BOX CAR.

VALUABLE EXPERIMENTS WITH FREIGHT CAR TRUCKS.

PROFESSOR L. S. ENDSLEY, of Purdue University, has announced the preliminary results of an extensive series of tests to determine the frictional resistance of various types of freight car trucks. The tests were conducted on an arch bar truck and an Andrews side frame truck, both of standard design, the former weighing 22,886 pounds and the latter 20,300 pounds. Thirty-two different wheels were used in such combinations as to make ten sets. New, medium new and old wheels were used so as to make as wide variation in wheel conditions as is met with in practise. One of the purposes of the tests was to determine the effect of the different degrees of curvature upon frictional resistance. The average results were as follows:

Track	Mated Wheels	Non-mated New and Medium New	Non-mated Old	Non-mated Medium Old	Special No Coning
Tangent	6.90	7.53	12.82	9.96	14.25
3 deg. curve ...	8.43	7.99	19.50	14.08	21.27
6 deg. curve ...	10.40	11.43	30.03	20.22	33.79
12 deg. curve ...	20.10	25.20	37.70	28.16	45.97

It will be seen that the condition of the mating of the contours has a very important bearing upon the frictional resistance of a truck. The tests which were made in the first week of November threw some interesting light on the comparative frictional resistance resulting from the use of winter and summer oils. In the 146 tests made, the average resistance from the summer oil was taken at 14.77 pounds per ton as contrasted with 8.41 pounds per ton for the winter oil. The tests further show that the frictional resistance of a truck equipped with wheels of average contour on new rails is from 10 per cent to 25 per cent less than for the same wheels on old rails. Where old wheels with high flanges are used, this tendency is not apparent. A truck equipped with old wheels and high flanges gives a frictional resistance of approximately 100 per cent higher than is given where the truck is equipped with new wheels. Wheels which are exactly mated give a much lower resistance than those which are

Digitized by Google

mis-mated. The coning of wheels is of great value in reducing friction on low degrees of curvature. A truck constructed so that it will not get out of square will give less friction on a great degree of curvature than a truck which does not remain square.

LIGHTING SPECIFICATIONS FOR POSTAL CARS.

THE sub-committee on the Relation of Railway Operation to Legislation has issued its Bulletin No. 44 dealing with the subject of lighting specifications for full postal cars. These specifications are in a sense supplementary to the specifications approved by the Postmaster General on March 28, 1912. The present specifications, which have been approved by the Postmaster General, are the result of comprehensive and scientific tests made by the Baltimore and Ohio under the supervision of its Electrical Engineer, Mr. J. H. Davis. The specifications deal with the matter of the construction of lighting systems, the proper location of light units, the determination of minimum and maximum initial illumination values permissible in the various parts of the car and the proper type of emergency lighting system for such cars. It is expected that with the equipment of mail cars under these specifications, the maximum of efficiency as regards the provision of light at all points for railway mail clerks, will have been attained.

Electrical

Electrification of Steam Roads.

ONE of the most important developments of the month is the announcement by the Chicago, Milwaukee and Puget Sound Railway Company of the immediate electrification of 450 miles of the main line between Harlowton, Montana, and Avery, Idaho, comprising the portion of the mountain division in which the heaviest grades are encountered. This company, it will be remembered, is the subsidiary of the St. Paul system organized to build its line to the Pacific coast. The work of electrification, the contract for which will soon be let, and the definite cost of which has not yet been fully determined, is another step in the direction of more economical operation by the large railway systems, particularly in the district where heavy grades prevail. While plans have not been definitely made, it is probable that a 2,400 volt system of overhead transmission will be used. Regeneration is being seriously considered. It is expected that installation will be begun within eighteen months and the completion rushed.

The plan, as it is outlined by the St. Paul management, provides that a large part of the power for the operation of the St. Paul line is to be purchased under a long term contract from the Great Falls (Mont.) Power Company, which is developing power at Great Falls, where 125,000 horse power energy is available. This power company has for several years been endeavoring to secure from the Government the permanent right to maintain a transmission line across the public domain. The best that it was able to secure was a permit, revocable at any time. The St. Paul was unwilling to invest millions of dollars in electrification work if the supply of power might be shut off at the whim of the Government. After prolonged negotiations, Secretary Fisher, as head of the Department of the Interior, has granted to the power company a fifty-year franchise for the construction of its transmission lines, under the provisions of the Act of March 4, 1911. The Great Falls Power Company is to have three substations along the line at points to be hereafter determined. In addition to the power purchased from the Great Falls Company, two other corporations are to furnish a large amount of energy. The Montana Power Transmission Company is to erect five stations at points to be later selected, while the Thompson Falls Power Company will install one station. This corporation has under contract a 50,000 horsepower hydro-electric station at Thompson Falls, Montana. Energy will be supplied by the power companies at 110,000 volts and 60,000 volts. It is understood that the St. Paul will use an overhead system of power distribution.

Southern Pacific Electrification in Oregon.

IT is announced that unless further and unlooked for delay is encountered, The Portland, Eugene and Eastern Railway Company's electrified line between Corvalis and Portland will be in operation by June 1st. This company is a subsidiary of the Southern Pacific system. The work is in an advanced stage, the line between Monroe and Eugene being practically completed.

The Economic Side of Electrifying Heavy Grades.

MR. A. H. ARMSTRONG, of the Railway Department of the General Electric Company, in an article in the *Electric Railway Journal* of January 4th, outlines in an interesting fashion the economic advantages which are to be attained through electrifying steam railroads, particularly where heavy grades prevail. Without going into the technical information so copiously assembled by Mr. Armstrong, or analyzing the steps by which he reaches his conclusion, it is interesting to note the advantages which he claims for electric traction. In the first place, he shows by a compilation of experience, that it is impossible to operate on a practical basis steam engines on heavy grades with the speed which is possible with electrical equipment. Using the performance of the electric locomotive as a standard, he finds that a simple locomotive on a two per cent grade will haul about 57 per cent of the total tonnage of the electric, while the Mallets will pull about 80 per cent. As against a speed of fourteen miles per hour for the electric locomotive, the simple engine will give a performance of 7.35 miles per hour and the Mallet will attain 6.38 miles per hour. The electric locomotive will show an elapsed time on a mountain division of 220 miles in 13.72 hours as contrasted with the steam engine's performance of 18.65 hours. In addition to these

Digitized by Google

advantages, Mr. Armstrong contends that the electric locomotive is more reliable, more rugged and is more uniform in operation than the steam locomotive; that it can be operated twenty-four hours in the day at a stretch, if necessary; that no time is necessary for coaling or watering, and that the fire risk with such engines is much lower. The aggregate of the savings from the use of electrical equipment will, under most conditions, more than offset the increased capital investment.

TERMINAL IMPROVEMENTS.

Opening of the Grand Central Terminal.

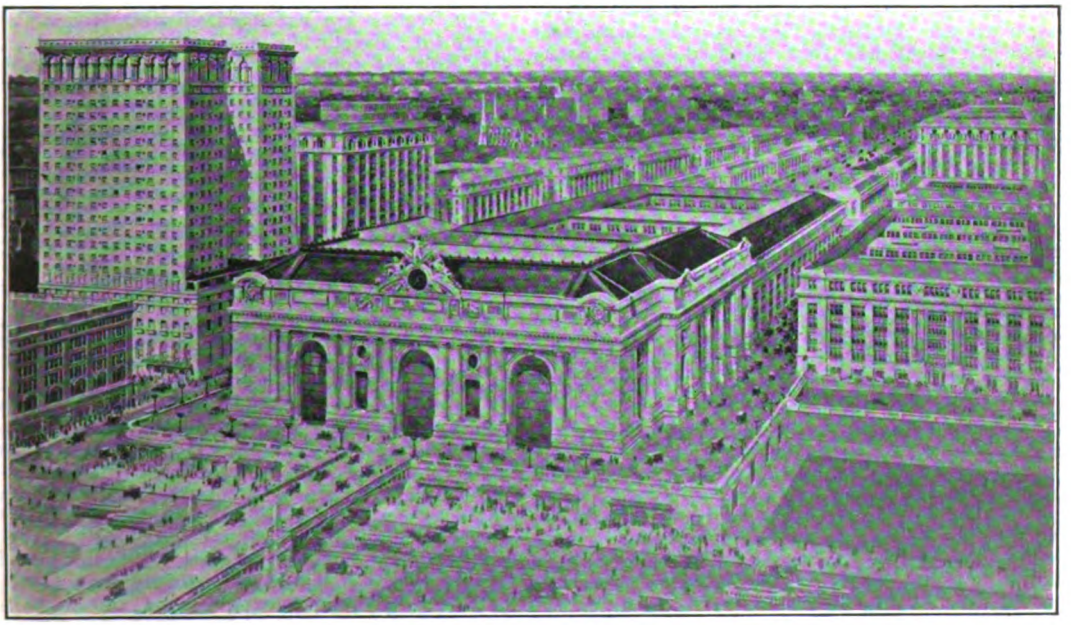
THE New York Central Lines on February 2nd, threw open the doors of its new Grand Central Terminal in New York. This great structure expresses the best thought and highest skill of architect and engineer and is a worthy companion to the Pennsylvania Railroad's terminal located only a few blocks away. In the construction of this monumental gateway, the dominant idea has been to combine beauty and magnitude with convenience and serviceability.

Construction has been conducted under the most difficult conditions. While it is a comparatively easy matter to dig a hole, lay tracks and put up a building, it is an entirely different matter to rebuild a station under traffic, change the entire plant so that no vestige of the old remains and keep 800 trains running and handle from 75,000 to 100,000 passengers a day. This is exactly what the New York Central has accomplished, but not without solving the most intricate engineering and operating problems. A single example will illustrate how well these problems have been worked out. During the eight days from August 30th to September 6th of last year, which included Labor Day, the number of people in and out of the terminal totalled 944,000. There were 4,826 trains handled during this same period, with an average delay of but twenty-one seconds per train.

The employment of electricity instead of steam as motive power has enabled the New York Central in building its beautiful terminal, to start the development, at the same time, of a civic center, of which not only the citizens of New York, but the entire country, may feel proud. The tracks have been depressed below the street level, thus reclaiming about twenty city blocks, and throwing the entire area open for building purposes. On this land will be constructed handsome commercial buildings, office structures, hotels, apartment houses, club houses, etc., instead of a steam and smoke field railroad yard, which would be necessary under steam motive power.

The exterior of the main terminal building is granite and Indiana limestone, and in its construction the architects had in mind an expression of the old terminal idea, which is a gateway to a city. The central part of the facade is in the form of a triumphant arch of monumental proportion, surmounted by the statuary group representing Progress, Mental and Physical force.

One of the unique features of the building is the overhead street. It is by this street that Park Avenue (which is carried over 42nd Street on a viaduct) passes around the station and continues north from 45th Street. Inside the main terminal building are the waiting room, concourses, baggage rooms retiring rooms, information bureaus and other features of a railroad station. The total area of the rooms for the public is six acres and 30,000 people can be accommodated therein at one time without crowding.



GRAND CENTRAL TERMINAL, NEW YORK, WHICH WAS OPENED TO THE PUBLIC ON FEBRUARY 2.

Digitized by Google

The outbound concourse, the principal feature of the main building, is a magnificent room 275 feet long, 120 feet wide and 125 feet high. It is finished in Botticino marble and buff-tinted stone and it contains ticket office, baggage checking booth, parcel room, information bureaus etc. These facilities are so arranged that the movement of the traveler is a progressive one; the ticket window coming first, the Pullman window next, and then the baggage checking office, etc. Another feature is the arrangement of train gates and indicators. Immediately upon entering the concourse the train gates are in full view and the indicators so conspicuous that the desired track and train can be located at once from any part of the room. The same care in planning the concourse has been exercised in making it easy to enter and leave the trains by the adoption of high station platforms, which are on a level with the car platforms.

Underneath the main concourse is the suburban concourse, which has about the same dimensions excepting as to height of ceiling. The most beautiful and striking feature of the suburban level is the main incline walk or ramp from the subway to the concourse. It has a marble corridor, forty feet wide, descending at a gentle slope between the main waiting room and the concourse.

Underneath the lower level of the tracks are two transverse subways. Outgoing baggage is loaded on electric trucks and sent down by huge elevators to the baggage subway. The trucks are then sent from the subway and lifted by elevators to the track level from whence they are transferred to the designated train. By this arrangement the passenger platforms are kept free of baggage trucks.

No description of the terminal would be complete without reference to the all electric signal system. The main signal tower is located at 49th Street. This tower is a four story building, below the street level and houses the interlocking machines by which the signals and switches are operated. The machine from the suburban level has four hundred levers each of which operates a signal. On the floor above is a machine which has three hundred and sixty-two levers operating the signals and switches on the street level. To each forty levers a man is assigned who works under the instruction of a train director, who, in turn, decides upon the track that each train is to be placed. The movement of the train is indicated by little electric lights on a chart which is a fac-simile of the track layout of the yard. As a train passes over the switches the lights on the chart are extinguished and not relighted until the train has passed over the switch on to the next one. The directors in these two towers control the movement of 800 trains in and out of the terminal each day.

Another new feature of the terminal is the system of advising the gatemen on the concourse when to open the gates and admit passengers to the trains. An electric lamp is sunk in the hand rail in front of each gate and when the train is ready to receive passengers the conductor presses a button, illuminating this lamp, thereby notifying the gateman that all is ready. At the moment the train is due to leave, the gateman will close the gate and press a button located on the same hand rail, which will illuminate a lamp on the platform near where the conductor will stand, thereby notifying him that the gate is closed and he may proceed.

An unusual feature of the new terminal is the elimination of stairways, accomplished by the use of ramps, or inclined ways, thus providing for the movement of vast crowds from point to point without confusion. This is an arrangement infinitely better than stairways, which are not only a nuisance, but dangerous, when traversed by large crowds. The grades of the ramps were determined after a number of interesting experiments. Temporary ramps were built and all sorts of people walked up and down—fat men with suit cases, lean women wearing long skirts and arms filled with parcels, school children with bundles of books—and as a result very easy grades were established; in fact, a passenger to or from the express level will hardly be conscious of the fact that there is any grade at all between the street level and the train platform. The ramps to the suburban level are of necessity a little steeper.

All these inclined ways are located in direct lines of traffic so that the immense crowd that moves to and fro will never have to turn any corners or turn around and go back. In other words, to handle the millions that will sweep back and forth through this gateway, everything is arranged to avoid all possible friction or confusion. It will not be necessary to teach people where they should go, they will naturally move in the right direction. That is the main thing to be considered in handling a big crowd day after day.

Another feature is the complete segregation of through and local inbound and outbound traffic. This is accomplished by having separate waiting rooms and concourses for the local and through business and a separate station for the incoming traffic, and eliminates at once all counter currents of travel and the confusion resulting therefrom.

The tracks are arranged on two levels, the upper for through business, the lower for local, and both are connected with loops which circle around under the main building. After the passengers are unloaded the trains are taken around the loop, the baggage cars shunted to special baggage tracks for unloading, the train proceeding to the storage yard, or, if a local train scheduled to leave within a short time, it is placed adjacent to one of the outgoing train platforms, ready to receive passengers.

New Office Building for the Burlington.

THE headquarter offices of the Chicago, Burlington & Quincy R. R. in Chicago are being moved into a new general office building, at the corner of Jackson boulevard and Clinton Street. The building fronts 151 feet on the boulevard and 175 feet on Clinton Street, and it is 15 stories high. It is of the Gothic style of architecture, built of steel framing, enclosed and protected on the outer walls with enameled terra cotta. There are eight passenger elevators and one freight elevator and a complete system of tubes, operated by compressed air, for the transmission of telegrams, mail, etc., between the various departments, and a well-equipped mail room located on the ground floor. The indirect system of lighting is used. A com-

Digitized by Google

NEW OFFICE BUILDING OF THE BURLINGTON AT CHICAGO.

plete power plant, including a large battery of automatically stoked safety boilers, is located in the basement.

The building houses approximately, 2,000 employes, and the cost of the ground and structure was about $2,000,000.

Large Ore Dock at Duluth.—What it is said will be the most costly iron ore shipping dock in the world will be constructed by the Duluth, Missabe & Northern Railway Co., at Duluth, Minn. The dock will be of concrete and steel and will cost about $2,750,000. It will have 384 pockets of a storage capacity of 300 tons each. The dock will be 2,300 feet long, 56 feet wide and 80 feet high. There will be an independent approach half a mile in length, connecting with the main line of the Missabe road. The Duluth & Iron Range Railroad is planning a number of improvements on its ore docks at Two Harbors. Sixteen pockets will be added to one of its docks, adding a storage capacity of 4,000 tons and giving the railroad a total capacity of 200 000 tons storage at Two Harbors.

St. Paul Station at Tacoma.—The St. Paul expects to have one of the finest passenger stations and office buildings west of Chicago and St. Louis. It will be built at Tacoma, 280 feet square, will cost $500,000. It is to be used by the Tacoma Eastern, the St. Paul and possibly the Northern Pacific.

Santa Fe Terminals at Denver.—The Atchison, Topeka and Santa Fe has purchased land in Denver, Colorado, at an estimated cost of $500,000 for the purpose of building into the heart of the city and establishing its own terminal. It proposes to spend an additional $2,000 000 during 1913 in constructing tracks and freight houses in the business section of the city and in South Denver and Englewood, and in improving tracks between Denver and Pueblo.

More Land for Freight Terminals at Chicago.—It is announced that the Central Terminal Railway at Chicago, a subsidiary of the Canadian Pacific, has acquired 13 additional parcels of property for $525,000, to be used in connection with its freight terminal to be erected at Canal and 15th Streets.

Proposed Relief for Freight Congestion at Chicago.—A comprehensive plan for the interchange of transportation of freight, one that will relieve congestion in the downtown terminals through the use of facilities afforded at the yards at Clearing, Ill., has been evolved by W. H. Lyford, general counsel for the Chicago & Eastern Illinois Railroad.

Expenditure of a large sum of money is involved in completing the scheme. It is proposed that warehouses be erected where less than carload freight will be assembled and loaded. Instead of freight being trucked about from one loading platform to another, it is proposed by Mr. Lyford that moving sidewalks be used to carry consignments from the loading platform of one railroad to that of another.

In discussing the plan Mr. Lyford said: "It is proposed to remove from these downtown terminals all the freight handled by subways, lighters and lake boats, and all of that which is now handled by wagon for a distance of more than one mile from each terminal station, and to concentrate all this freight at the common transfer facilities just outside of the city limits, between Sixty-third and Seventy-first Streets. The freight subway will extend trunk lines from the transfer stations and deliver there all the freight which it now sends to the downtown terminals.

"Lighterage freight will be transferred to freight cars at some convenient point and thence moved to the transfer station. Lake freight will be transferred to railroad cars or lighters at the new harbor about to be constructed at the mouth of the Chicago River, and thence moved to the transfer station. Joint receiving stations for all roads will be established on the tracks of each company in every industrial centre throughout the city. At these stations freight will be received for all companies, loaded into large trap cars and moved promptly to the transfer yard.

"By the co-operation of all the railroads in the use of common transfer facilities pressure upon downtown freight terminals will be removed, and the present terminals will be adequate to handle all of the freight which can be delivered there with more economy than to the common transfer yard."

Big Railroad Shops for Canadian Pacific.—The second largest railroad repair shops in the world, those of the Canadian Pacific Railway, near Calgary, Alta., are being built, with a speed which breaks all records. They will cost $2,500,000, and will be completed within twelve months of the day when the prairie was broken and work begun. The shops when completed, as expected, will employ 2.500 men, and a town is growing up around the shops named Ogden in honor of Vice-President Ogden, of the Cana-

Digitized by Google

dian Pacific Railroad. The electric power for the plant will be purchased from the city of Galgary.

River Front Railway for New York.—Secretary of War Stimson has been informed by port officials of New York that in connection with the construction of the proposed 1,000-foot piers to the north of the present center of congestion in the Hudson River, it is proposed to construct a marginal railway along the shore ends of the piers. This railway it was stated, will be capable of giving an express service. Secretary Stimson let it be known that he was much opposed to any extension of the piers in the Hudson River on either side that would further encroach upon the channel, and that the most he would be willing to allow would be such a lengthening of the existing piers or the construction of such new piers as would not extend beyond a straight line connecting the most prominent points on shore.

The Lehigh Valley Railroad is anticipating terminal developments about to take place in New York Harbor, and also the impetus to be given to handling the grain trade once more in this part of the country, by its improvements in the Greenville section of Jersey City. The Lehigh Valley has for years been improving its facilities for handling this grain traffic, in the matter of cars, service and terminals. The latest addition to equipping for this, is the grain elevator at the National or Lehigh docks on the west shore of New York Harbor. This is in addition to the transfer elevator already at the National docks, which will remain in operation with existing barge storage facilities. The capacity of the new elevator will be 443,000 bushels which can be increased as demand for enlargement arises. The cost of the elevator will be $2,000,000 and it is expected to be completed about May 1st.

At a meeting of the representatives of the eastern trunk line railways, called by President Ralph Peters of the Long Island Railroad, to consider plans for operating the South Brooklyn water front terminals after same have been acquired by the city, on a basis of cost and in the interest of the trunk lines, the following committee was appointed to make a complete investigation of the proposed development and to prepare plans and scope of a union company to handle the property on a co-operative basis: Chairman, Ralph Peters, for Long Island and Pennsylvania Railroads; J. C. Stuart, Erie; W. G. Besler, for Jersey Central; A. H. Smith, for New York Central, and J. A. Middleton, for Lehigh Valley.

The above representatives also adopted resolutions endorsing the action of the city by the Board of Estimate, and of the Chamber of Commerce in approving a plan to develop a city-owned railroad along the South Brooklyn water front, connecting the piers, warehouses and terminals of the Bush Terminal and the New York Dock companies. The railroads represented at the meeting testified in favor of the plan submitted by the city representatives with the condition that details can be developed to the mutual interest of all concerned.

Switching Yards for the Northwestern.—Owing to the congested condition in the freight yards of Racine and Kenosha, the Chicago & Northwestern Railway Company will expend $400,000 in the purchase of 260 acres of land and the building of switching yards midway between the two cities.

Connection of Boston Railroad Stations Planned.—Press reports state that plans for the construction of a four-track line from the South Station to the North Station, making a direct connection between the New Haven and the Boston & Maine roads, and abolishing the North Station, have been practically completed. This means that the New Haven and the Boston & Maine in Boston will probably be electrified. The project involves an expenditure of at least $50,000,000.

The Interstate Commerce Commission

Commission Elects New Chairman.

FOLLOWING the resignation of Chairman Knapp from the Interstate Commerce Commission in 1910, the Commission have adopted the practice of electing one of their members as chairman for a period of one year, and, in accordance therewith, Commissioner Franklin K. Lane was elected on January 7, 1913, effective January 13, 1913, to be chairman for the ensuing year.

The several chairmen since the organization of the Commission have been as follows:

Hon. T. M. Cooley from April 1, 1887, to January 12, 1892;

Col. W. R. Morrison from March 19, 1892, to December 31, 1897;

Hon. Martin A. Knapp from January 11, 1898, and annually re-elected for each successive year until January 13, 1903, when re-elected to continue until otherwise ordered. Mr. Knapp resigned from the Commission some time in 1910.

Hon. Judson C. Clements was chairman for the year 1911.

Hon. Charles A. Prouty was chairman for the year 1912.

The date of exipration of the terms of the several Commissioners is as follows:

Judson C. Clements, December 31, 1913.
Charles A. Prouty, December 31, 1914.
Charles C. McChord, December 31, 1915.
Franklin K. Lane, December 31, 1916.
Balthasar H. Meyer, December 31, 1917.
James S. Harlan, December 31, 1918.
Edgar E. Clark, December 31, 1919.

Commissioner McChord was appointed to fill the vacancy of the unexpired term of Judge Knapp.

Commissioner Meyer was appointed from January 1, 1911, for the full term of seven years and

Digitized by Google

FRANKLIN K. LANE,
ELECTED CHAIRMAN OF THE COMMISSION FOR 1913.

succeeded Commissioner Francis M. Cockrell, whose term had expired.

Commissioner Clark's term expired December 31, 1912, but he has been reappointed by the President and it is fully anticipated that his appointment will be confirmed by the Senate.

The Western Classification Decision.

IN many respects one of the most important matters that the Interstate Commerce Commission has yet decided, was made public on December 31st in its opinion 2110, "In the matter of the suspension of Western Classification No. 51."

The importance of the case consists in the many issues and the consequences involved rather than in the Commission's orders, for it must be admitted that the larger questions are discussed but not determined; probably it was the part of wisdom at this time to counsel with and not judge between the contestants.

Western Classification No. 51 was to have become effective February 15th, 1912; it was suspended by the Commission the full statutory period of ten months and was voluntarily postponed by the carriers for two months, so that it may come into effect one year after the date intended. Nowhere in the history of freight classifications can there be found a parallel for the storm and stress of this period. The Commission's record of the case is a story of conflict; at times between carriers and commercial interests, or among the commercial interests divided on territorial lines; at other times between carriers and state railroad commissions, or among the commissions of the several Western states divided as the influence of commerce interests came into play.

Aside from the rules there were estimated to be between 1,500 and 2,000 changes, of which less than half represented advances.

The greater part of these changes was the result of the movement to effect uniformity of freight classifications throughout the country and this case has served to bring into prominence many of the results that must follow the adoption of uniform classification provisions.

The Commission's report of 160 pages divides naturally into four parts, a discussion of classification history, theory and practice; the consideration of new classification rules; the determination of complaints respecting individual descriptions of articles in the classification; and the suggestions for the guidance of the carriers in the future with respect to classification matters.

Logically following its declaration that "classification is an art or science in itself," the Commission holds that "a compilation of classification units" (intended to express the relation of various classified articles with respect to weight, space and value) "just as far as practicable for every item in the classification would doubtless be of substantial value"; and that "a body of experts in classification should hear and know everything and then form their conclusions. The conclusions thus formed should not be lightly set aside."

The introductory statement that "The two really momentous questions involved in this proceeding are the questions of minimum weights and of mixtures" seems to refer to the gravamen of the complaints and not to the relative importance of the issues involved in the matter of classification uniformity. The Commission's expression is evidently based upon the popular conception, for as might have been expected, the effects rather than the causes came prominently into the discussion, as evidenced by the burden of complaint. The questions "where carload ratings are necessary" and the "relation between carload and less than carload rates" are fundamental and of greater importance, because these set up and establish the measure of discrimination against the small shipper and in favor of the large shipper, based upon a quantity consideration, while the carload minimums and mixtures are "accessories after the fact" if there be such a thing in other than the legal sense.

The Commission has heretofore consistently opposed any theory of inherent right to carload rates but at this time the possibility of a change of view seems to be foreshadowed in the statement "that a carload rating should be established for a commodity when that commodity can be offered for shipment in carload quantities, unless public interests or other valid considerations require the contrary." What the "public interests or other valid considerations" may be is left to conjecture, but the question is again referred to "assuming a proper relation between carload and less than carload rates, the establishment of carload ratings whenever carload quantities are offered will, we believe, meet the needs of new and growing lines of industry without discrimination."

The view that "an excessive difference between the carload and less carload rates on the same commodity results in undue preference to the carload shipper" leads to suggestions respecting "the establishment of just relations between carload and less than carload quantities in accordance with some consistent principle throughout the classification." These suggestions respecting the establishment of carload rates and their relation to less carload rates, mark the opening of a new field.

Digitized by Google

While the conclusions respecting carload mixtures do not by any means dispose of this time-honored problem, the Commission has displayed wisdom in the reasoning upon which it maintains the "status quo," which is summed up in the ninth paragraph of the syllabus:

> "Liberal provisions should be made for mixtures. Artificial restrictions upon mixtures are restrictions upon the freedom of trade and commerce, with a tendency to militate against the small man. Mixtures result in a better utilization of car space; they lessen the demands upon terminal properties, they decrease the expense of operation, and facilitate the movement of freight. A brief statement is made of the arguments for and against the incorporation in Western Classification of rule 10 of Official Classification."

Carload minimum weights should be based upon the commercial as well as physical conditions, and after all, this is the course the carriers have generally followed. In the several decisions respecting descriptions of articles, the Commission supports the efforts to effect economical transportation, as represented in heavy minimums, and approves increased ratings where substantial reductions in the minimums have been necessary because of physical or commercial conditions brought to light.

The rules of a freight classification have a much broader application than the classification proper, in that they furnish a body of regulations that apply to commodity tariffs as well as class rate tariffs.

The trivial objections made to the proposed rules, in view of their broad scope, make it evident either that the complainants' study of them was superficial or that the rules represent to an unusual degree the best thought respecting traffic regulations. On the part of the Commission there is manifest a desire to aid the carriers in making effective the practices and regulations that make for fair dealing and safe transportation, and many of the suggestions will be of value as making for proper classification construction and reasonable interpretation.

In any complicated matter such as this body of rules there is ample opportunity for a misunderstanding of conditions and intent. It would not be surprising if some of the suggested betterments would fail of their purpose, especially where they have been based on objections made by some of the state representatives whose knowledge was limited to what had been gathered in the effort to destroy what they possibly could not comprehend. That such a possibility has been foreseen is indicated by this expression:

> "Where the number of changes, however, is as great as is involved in this one proceeding it is apparent that no body of men can, in a relatively short time, give such consideration to each item as will enable them to express their conclusions with reference to each with that degree of confidence as to their correctness as would be desirable. While the record is full, and apparently complete, in regard to many items, there are numerous others with reference to which there is no direct testimony nor other evidence; and we wish to state at the outset that we shall hold ourselves in readiness to modify any of the conclusions or suggestions herein expressed just as soon as sufficient reliable information making such modifications just and proper may become available."

The compass of this review will not admit any detailed consideration of the rules, but these features may be noted:

Rule 6 (B) deals with the sliding scale of minimums for light and bulky freight and in its consideration the Commission reaffirms the principles of its Rule 66 and of its several opinions that culminated in Noble versus Baltimore and Ohio Railroad Company, 22 Interstate Commerce Commission 432.

Rule 7 (C) makes detailed provision for marking freight, a question on which there has been much difference of opinion in the past, but the conclusion (except as to Section 2 (e) which is really a part of Rule 24) is summed up in the disapproval of the requirements for metal eyelets in tags.

Rule 8 provides a set of elaborate specifications for packages which have been strongly objected to because they are thought to be too technical for universal use, but here the Commission's record is surprising in that it finds them too indefinite. "Both sections are new. Objections came from many quarters, chiefly on the ground that the provisions are too general and indefinite, and consequently too much is left to the personal judgment of the individual agent. We think there is much force in this contention." It is probably true that if the carriers had made strict and definite rules, they would have been attacked as being too technical and severe.

In respect of dunnage the Commission is controlled by the principles announced in several lumber cases, and it is held that the liberal practices of the past respecting weight allowances should continue.

Where the description of articles is reached, the consideration, having specific complaints to proceed upon, becomes more definite. At the outset the Commission marks and disapproves a tendency "to apply a higher rating on commodities in packages in barrels or boxes than on commodities in bulk in barrels or boxes." The carriers' side is that the goods in the small packages are usually shelf goods of the higher values, while those shipped in bulk are not only generally the cheaper, but that bulk packing is frequently the raw material for subsequent manufacture or repacking. The Commission's view is that the commodity in the smaller package represents more security than when in bulk and that if the values are close, the packages should be rated alike.

In upsetting a practice of the carriers of long standing the Commission is apparently controlled by "the cost of service" considerations and perhaps attaches too little importance to "the value of service." However, there is compensation for the carriers in the Commission's view that "the carrier may be justified in prescribing a higher rating on articles packed in a less than in a more secure package" and again:

> "Packing Requirements.—The propriety of increasing the rating upon an article when it is offered loose or in bundles with practically no protection as compared with the rating of the same commodity when boxed or otherwise fully protected, can not be questioned. A package which is less desirable from a trans-

Digitized by Google

portation standpoint deserves to be given a higher rating than one which is more desirable. The approval of this rule, however, does not sanction disproportionate and arbitrary increases in the rating of an article when offered in a less desirable package. There should be some relation between the increased rating and the increase in the risk, difficulty of handling, and other proper considerations."

Perhaps the most important of the decisions respecting descriptions were those: Affecting the agricultural implement minimum, where the carriers proposed 24,000 pounds subject to the increased minimums for larger than standard cars as provided in Rule 6 (B), the Commission holding that the 20,000 pound minimum, which is generally operative by exceptions to the classification in the West, should be applied with Rule 6 (B). The Commission also brought about an understanding that binders' twine should be continued in the agricultural implement mixtures.

The carriers' attempt to remove the rating for candy based on low value, by reducing high priced candy from first to second class and advancing cheap candy from third to second, was approved.

On machinery there was a strong protest against an attempt to restrict the mixtures currently permitted and this change is not approved, but the Commission does approve the application of Rule 6 (B) where cars larger than standard are used.

Canned goods had been the subject of a revision that proposed a separation of fruits from vegetables, while including with canned fruit the heavier preserves, jams, jellies and the like which have not been in the mixture. The shippers' protest results in a voluntary restoration of the mixture including the preserves, etc.

Paper is one of the most difficult commodities for which provisions have to be made, and the specifications proposed in this case were the source of much contention. The Commission does not support an attempt to draw a line between mill sizes and the smaller sizes cut for commercial forms or letter paper.

These are referred to as among the more important of the 195 decisions respecting descriptions, that are separately discussed in the Commission's opinion, but it is evidently expected that the principles laid down here and there, will be applied throughout the classification, presumably in cases concerning which there has been no complaint.

The declarations of the Commission in the opinion should do much to secure recognition of the growing importance of the work of the classification committees and to dignify their proceedings. It is within the bounds of reason that such work, proceeding more and more under the guidance of the Interstate Commerce Commission will come to occupy a middle ground between the carriers and the Commission, hearing the public, and reporting recommendations to the carriers on the one hand and reporting conclusions (and reasons, if necessary) to the Commission. Indeed the Commission points very directly to such a possibility:

> "The making of a freight classification is a great public function. In the past the hearings before the classification committees have been semi-public rather than public, and in a certain sense they have been private, although in later years the tendency has been toward greater publicity."

> "Procedure in the Future.—The formal hearings of classification committees hereafter should be made public, after due notice to the interested parties, including state commissions and the Interstate Commerce Commission. A record of the facts and arguments for and against a certain classification should be kept. As rapidly as items, or groups of items, have been disposed of by the classification committee they should be published in accordance with law. In case of a protest to this Commission, the record made up before the committee should be properly transmitted to the Commission. On the basis of this record, supplemented when necessary by additional inquiries, the Commission will be able to decide whether or not to suspend a proposed change in the classification. We believe that this manner of procedure will obviate nearly all formal proceedings in the future and will confine investigations on the part of this Commission to the relatively few and large matters decisive of principles and possibly also affecting great material interests.
>
> "While in this report there are suggestions and conclusions which probably would be equally applicable to classifications other than the one under consideration, in the territories to which they apply, these suggestions and conclusions are specifically applicable only to the classification herein considered and the territory in which it applies, since the others are not before us in this proceeding."

These outlines for the guidance of classification committees, that really amount to a forecast of classification practice, in our opinion, completely overshadow every other result of this case.

Therefore, it is the prophecy rather than the judgment that marks this as one of the most important opinions that has yet proceeded from the Interstate Commerce Commission.

Private Wire Contract Investigation.—The Commission has issued a notice that it intends to investigate the private wire contracts of the Western Union and the Postal Telegraph Companies. It has been alleged that persons other than the parties to the contracts frequently use private wires for transmission of personal messages, which is in violation of the Interstate Commerce act.

New Haven Not Responsible for Greens Farms Wreck.—No blame can be attached to the New Haven Railroad for the accident at Greens Farms, Conn., on November 6th, in which 27 passengers were injured, according to a report made to the Interstate Commerce Commission by Chief Inspector of Safety Appliances Belnap. The derailment, the report finds, was caused by the breaking of an equalizer bar on the forward truck of the dining car. There was a defect in the bar but so slight that Mr. Belnap asserts no blame can be laid through improper inspection. The track where the accident occurred is straight and the report does not blame the engineer for speeding up.

Uniform System of Accounts for Telephone Companies.

The Commission has promulgated its uniform system of accounts for telephone compan-

Digitized by Google

ies. The act to regulate commerce invests the commission with authority to prescribe the forms of accounts to be kept by telephone companies.

Investigation of Hard Coal Rates.

The Commission has sent to all coal companies in the anthracite field, a pamphlet of questions to be answered by March 1st. next. They deal with every phase of the business and are for the purpose of an exhaustive inquiry into rates, practices, rules and regulations governing the transportation of anthracite coal.

High Demurrage Rates in California.

By a decision handed down by the Commission, the California roads were permitted to put into effect on January 6th, the increased demurrage charges in the State, applicable to interstate shipments. It is held that the roads have proven the reasonableness of these increases, and further that the advances are not discriminatory against the shippers in California in favor of the shippers in other States.

Iron Ore Rate Investigation.

A special investigation into iron ore rates in Minnesota has been announced by the Commission and will begin soon. This investigation will involve the rates and practices of the roads owned by the United States Steel Corporation and the rates granted that corporation by other roads.

ORGANIZATION.

January Meeting of St. Louis Railway Club.—The first meeting of the New Year of the St. Louis Railway Club was held on the evening of January 10th. President Finley, of the Southern Railway delivered an address on "Transportation and Business."

Car Efficiency Discussed before Chicago Traffic Club.—At a special monthly luncheon, given by the Traffic Club of Chicago, on the 8th of January, J. M. Daly, General Superintendent of Transportation, Illinois Central Railroad, gave an interesting talk on car efficiency. In the course of his remarks, Mr. Daly suggested some possible remedies for car shortage and congestion, principal among which were the pooling of all freight cars by the various lines, also a suggestion for co-operation of shippers at time of heavy tonnage movement, by working their forces longer hours for the loading and unloading of shipments.

Chicago's Freight Association Appeals to Shippers.—Appeal to shippers to use more care in packing freight has been issued by the Local Freight Agents' Association of Chicago. It is pointed out by the association that there have been an unusually large number of infractions of what might be considered ordinary precautions to insure the arrival of freight at destinations in proper condition. Officials of the organization recently made an investigation of the proper packing and marking of freight with a view of submitting suggestions for improvement.

Annual Convention of Commission Merchants.—At the last annual convention of the National League of Commission Merchants of the United States held in Cincinnati, on January 10th, resolutions were adopted to the effect that all members of the National League of Commission Merchants, and the trade in general, support all claims with affidavits as to the essential facts, supporting such claims, thereby insuring the carriers a square deal in the filing of claims by forcing the claimant to state facts or perjure himself. This, it is stated, will eliminate the necessity of the carriers' exhaustive investigation which not only delays settlement but frequently causes the carrier more expense than the amount of claim.

New Lumber Organization.—The Southern Hardwood Traffic Bureau, with headquarters at Memphis, Tenn., has applied for a State charter in order to effect an organization for the purpose of contesting advances proposed by the railroads operating through the Memphis gateway and other principal traffic centers in the Southern Hardwood territory. The new organization, in effect, succeeds the Lumberman's Traffic Bureau at Memphis.

Annual Meeting of Civic Federation.—At the thirtieth annual meeting of the National Civic Federation held in New York on January 28th and 29th, the following questions were considered:

How far is it possible by law to prevent industrial disputes? Is the recommendation for Federal and State mediation boards with compulsory powers, made by the arbitrators in the recent controversy between the engineers and the eastern railroads, practicable or desirable?

During the past two years, the Federation has devoted much time and energy to the matter of

Digitized by Google

uniformity in State legislation, and it is planning an active campaign along a number of important lines through its State committees in the thirty-eight States where the legislatures meet this winter. There has been a great demand for the Federation's bills from members of the various legislatures having in charge the subjects which the Federation has been considering. It is believed that the material furnished them, having been drafted by experts, will be of substantial value.

The subjects upon which the Federation will propose legislation are:

"Workmen's Compensation,"
"Accident Prevention,"
"Pensions for Federal, State and Municipal Employes,"
"Reform in Legal Procedure,"
"Regulation of Public Utilities,"
"Mediation in Industrial Disputes."
"Regulation of Industrial Corporations."
"Regulation of the Manufacture and Sale of Drugs and Food Products," and
"The Commercial Measures of the Commissioners on Uniform State Laws."

A discussion of the proceedings of the Convention will appear in the March number of the "Railway World."

Southern Pacific Safety Committee.—The Safety Committees on the Southern Pacific were organized last June and since that time every accident of any description has been investigated by the committees and a remedy suggested to prevent a repetition.

Each of the ten divisions of the Southern Pacific has a safety committee that meets once a month to discuss the accidents of the past thirty days. A majority of these accidents are minor, such as smashed fingers and bruised limbs. "Safety First" is the watchword and the particular object of the meetings is to discuss methods of preventing such accidents.

Keeping the slogan "Safety First" uppermost in every employe's mind is a big part of the work of these committees. In the seven months that the safety committees have been in existence on the Southern Pacific hundreds of remedies for accidents have been proposed and accepted. Railings have been placed around machinery parts where there had been danger of the clothing of a workman being caught, and the different shops of the company are now equipped with safety devices and such accidents are rare occurrences.

Monthly Meeting of New York Traffic Club.—At the last monthly meeting of the New York Traffic Club resolutions were adopted favoring the appointment of a new committee to be known as the "Public Affairs Committee," with the following duties:

"This committee shall be watchful of the trend of public opinion, legislation, etc., affecting the interests of carriers and shippers, and which may in any manner affect the maintenance of the commercial and manufacturing supremacy of New York and such other related questions as the committee may deem proper or advisable to place before the club for formal action."

The following members were appointed to the new committee:

Chairman, B. D. Caldwell, president of Wells, Fargo & Co.; D. W. Cooke, general traffic manager Erie Railroad; George T. Smith, president First National Bank of Jersey City, N. J.; C. S. Keene, traffic manager American Tobacco Company; E. G. Warfield, vice-president and general manager Seaboard & Gulf Steamship Company, and Judge C. F. Moore.

Railway Business Association Elects Officers.—The Railway Business Association, at its annual meeting, elected the following officers for 1913:

President George A. Post, New York; vice-presidents, A. M. Kittredre, Dayton, Ohio; W. E. Clow, Chicago; C. W. Simmons, St. Louis; B. P. Bush, Columbus, O.; Alba B. Johnson, Columbus, Ohio; H. G. Prout, Pittsburgh; W. G. Pearce, New York; treasurer, Charles A. Moore, New York; and assistant treasurer, M. S. Clayton, New York.

Announcement of the personnels of the appointive members of the general executive committee will be made later.

In its annual report, the general executive committee makes the statement that the association begins its fifth year in an atmosphere notable for apprehension, less the railways may prove unable to provide adequate facilities. The report continues:

"We undertook a sort of census of shippers to ascertain definitely to what extent the fundamental facts of the situation had become known to business men. The result is herewith made public in 4,000 signatures of shippers and receivers, located in almost every State, declaring for a policy which will permit the railways 'adequate revenue to meet existing obligations and to attract capital for necessary improvements and extensions.'

"The increase in Eastern engineers' wages, followed by petitions from other employes, is an additional reason for anxiety that railway credit be conserved.

"It is, the arbitrators declare, 'imperative that some other way be found to settle differences between railroads and their employes than by strikes,' and what has been described by the labor representative on the board as compulsory arbitration is recommended. It is equally imperative to prevent stoppage due to insufficient facilities. But when it comes to applying the remedy the public faces a different situation. It might be possible under our form of government to prevent by law a number of employes from banding together to stop trains. Under private ownership the government cannot by law compel a railroad company to enlarge a terminal or buy locomotives and cars if it has not got the money, and it cannot compel investors to arbitrate whether they shall furnish the money.

"Statistics for the fiscal year ended June 30, 1912, compared with 1910—both bumper years—show a decrease of net operating income (after taxes are paid) of $462 per mile of line, or 12 per cent.

"That is, while enjoying larger receipts these roads had left per mile of road 12 per cent. less in 1912 than in 1910 available for interest on debt, for improvements out of earnings, and for dividends and surplus upon which to base credit in selling securities.

"The commission has said that it will act for the strengthening of railway credit if expenses should so increase as to convince them that the time has come. These shippers' signatures may

Digitized by Google

well suggest to the commission that the hour has struck for formulating such a policy and giving it public enunciation."

Report of American Railway Association on Car Location.—In accordance with a request of the Interstate Commerce Commission, the American Railway Association has completed a report showing the location of freight car equipment, whether on or off the home lines; also the total number of cars owned, home cars on home roads, home cars on foreign roads, and the surplus and shortage of freight equipment in relation to the demands of traffic. The report was compiled from data furnished by three hundred and eleven railroads and gives the information desired as of November 30, 1912.

The report shows that by all roads reporting there is a total of 2,251,541 freight cars owned, of which only 1,071,014 or 47.57 per cent. were home cars on home roads. Home cars on foreign roads were 1,176,673, while foreign cars on home roads were 1,210,740. The total number of cars on lines reported was 2,281,754, an excess over those owned of 84,068 cars. At the same time there was a surplus of freight equipment reported of 26,135 cars, and shortage of 62,536, a net shortage of 36,401. As to cars in shops, there were 97,240 home cars in home shops, or 4.53 per cent., and 32,436 foreign cars in home shops, or 1.51 per cent., making a total of 129,676 cars in shops, or 6.04 per cent.

Annual Dinner of Central Railway Club.—At the annual dinner of the Central Railway Club held in Buffalo on the evening of January 10th, addresses were delivered by the following men: Riley Williams, vice-president of the Schuylkill & Canastoga Valley Railroad; George M. Basford, assistant to the president, American Locomotive Co.; A. J. Grymes, manager marine department of the Erie R. R.; William McClellan, electrical engineer of the Public Service Commission, Second District, and chairman of the Electrification Committee of the New York Railroad Club; Hon. Devoe P. Hudson, Buffalo, N. Y.

At the annual meeting preceding the dinner, Arthur Hale delivered an interesting talk on "Freight Car Tactics." Mr. Hale's address was listened to with close attention, and is referred to more fully in another section of this issue.

The annual election was held by letter, and it is understood that most of the officers of the club were re-elected.

LEGISLATION.

National.—Legislative developments at the National Capitol during January, contained little of importance to the railways. The Pujo Committee continued its investigation during most of the month, and it is understood that it will shortly make recommendations to Congress in an effort to curb further concentration of financial power as indicated by the statement of the various witnesses. The "Shipping Trust" investigation has brought out information of considerable interest, and has apparently established the fact that the control of trans-Atlantic shipping is of a decidedly monopolistic character. How Congress, however, will be able to regulate commerce and conditions over which it has largely no control, is a problem, the solution of which is awaited with interest. This investigation is reported and discussed in greater detail in another section of this issue.

The opinion in Washington seems to be, that a physical valuation bill will be placed on the statute books at the present session of Congress. The sub-committee of the Senate Committee on interstate commerce, of which Senator LaFollette is chairman, has begun to hold hearings on this question. It is reported that certain interests which opposed the bill in the House are now willing to have a physical valuation placed upon the railroads for the reason that such valuation can be made a basis for rate making and would prove an effective argument in favor of rate advances for which the carriers have been strongly contending during the past two years.

Among the resolutions presented during the month which affect the railroads, was one by Congressman Linthicum, of Baltimore, which directs the House of Representatives to institute a sweeping investigation of the wrecks and accidents on American railroads and their causes, with a view of getting information for legislation which will place more safeguards around the traveling public. The resolution has been referred to the Committee on Rules. It directs an investigation not only on the causes of wrecks but as to the regulations for the selection of employes who handle the trains and the operating methods of railroads.

Regarding the New Haven situation, and the proposed investigation of railway conditions in New England, it has been officially announced that there will be no congressional investigation of this character which was to include the supposed traffic agreement between President Mellen, of the New Haven and President Chamberlin, of the Grand Trunk. In view of the Grand Jury proceedings in New York, the House Rules Committee has decided to drop the resolution presented by Representative O'Shaughnessy, of Rhode Island, which calls for such an investigation.

Among the developments in the Senate was a bill introduced by Senator Bristow, of Kansas, which is referred to at greater length in another section and which has for its object the creation of an industrial commission having much the same power over industrial concerns that the Interstate Commerce Commission exercises over the transportation service and the Controller of the Currency over the national banks. The bill combines the power and authority of these two governmental offices into one commission and gives it supervision over industrial enterprises that engage in interstate commerce.

In the House of Representatives, a bill has been introduced by Congressman Towner, of Iowa, requiring the railroads to carry packages of any weight above eleven pounds subject to rules and regulations by the Interstate Commerce Commission.

The House Committee on Commerce, held the following hearings during the month: January 24th, on the extension of pier heads in the Hudson River; January 28th, on classification of freight rates, and January 31st, on questions affecting transportation of baggage, mileage books, etc. On February 4th, this Committee

Digitized by Google

is to consider bills affecting safety of travelers and employes; on February 7th, legislation pertaining to the long and short haul clause; on February 11th, transportation of farm products; on February 14th, rates of transportation and on February 28th, handling and marketing of cotton.

Canada.—The Quebec Parliament has granted remarkable subsidies to the projected James Bay Railway. The bill incorporating the North Railway Company as the company is known, was passed by the Quebec Parliament last year and it provided for a land grant to the company of 4,000 acres of land per mile for that portion of the road south and 5,000 acres per mile for that portion of the line north of the National Transcontinental. A more recent action of the Quebec Parliament has doubled this last subsidy but provides that the actual construction of the road be commenced within six months and that the line north of the National Transcontinental be completed within three years.

The company is also to become the absolute owner of the mines and minerals on one-fifth of the lands granted by way of subsidy, but the company is to pay 25 per cent. of the net proceeds of the operation of all such mines. The Quebec government also undertakes to grant to the railway such water powers in the territory traversed by the road as may be needed for development for the purpose of operating the road at a nominal rental of 50 cents per horse power a year. The opposition leader objected strongly to such generous grants being made on the last day of the session, but the bill was put through promptly.

Connecticut.—In his annual message to the General Assembly, Governor Baldwin, of Connecticut, recommends the legislature to urge Senators to keep faith with Great Britain on the Panama Canal treaty and to ratify the amendment for the popular election of Senators.

The governor refers at length to the Hague tribunal and the obligations of the Hay-Pauncefote treaty bearing upon the use of the Panama Canal. He says:

"We have solemnly agreed as a nation, that disputes as to the true construction of any treaty between us and Great Britain, which diplomacy cannot settle, shall be settled by arbitration, unless they affect the vital interests, the independence, or the honor of the two countries, or the interests of third parties. Diplomacy has thus far failed to settle the present dispute. To break our agreement, made to meet just such a condition of things, would, it seems to me, be a plain breach of public faith."

Missouri.—Reports from Missouri indicate that the Legislature of that State will attempt this winter to enact a law creating a Public Utilities Commission, and another providing for the compensation of injured workmen. While it is not known whether the railroads of Missouri will oppose the creation of a Public Utilities Commission, it is generally believed that they will not providing the measure which creates it, is of a conservative and well-digested character.

Massachusetts.—An order has been introduced into the State Legislature requiring the Railroad Commission to investigate contract between New Haven and the Pullman Company, providing for operation of Pullman parlor cars on the New Haven system with a view to determining whether it involves a loss to the New Haven.

Two bills have also been filed with the House, one of which has for its object the repeal of so much of the railroad act of last year as gives the Southern New England corporation authority to extend its line in Massachusetts, and the other requiring the Boston and Albany Railroad to abandon its storage yards adjacent to Boylston Street, Boston and to electrify its line between Boston and South Framingham. According to the bill the first change has to be completed within the coming year, while five years is allowed for the electrification.

New York.—A Workmen's Compensation Bill has been introduced in both Houses of the Legislature and represents the result of an expert study of the subject by the State Insurance Department.

The act was made elective in form in order to meet the objections raised by the Court of Appeals to the compulsory compensation act. Every employer and employe is brought presumptively within the operation of the act unless they have given notice to the Insurance Department of their intention to reject its provisions. Experience has shown that this method brings in a number of people who are in doubt and cannot reach a decision in the matter. Employers who decide to come within the act are required to either insure their liability for compensation with stock of mutual insurance companies or give satisfactory proof to the Insurance Department that they are financially solvent and will be able to meet their obligations.

The compensation schedule contemplates payments, in cases of total and permanent disability, during the entire lifetime of the employe. In fatal cases the schedule of compensation is graded according to the number of dependents. Non-resident aliens are also covered by the act. The act gives the Superintendent of Insurance the authority to establish a bureau within the department, consisting of a board of examiners for the purpose of passing upon and approving each settlement. In disputed claims the litigants have the alternative of either submitting their cases to courts of law or having them decided by the board of examiners in the Insurance Department. Employers who refuse to come under the act are deprived of the three common law defenses.

Another bill has been introduced in the Assembly with the object of inserting in the railroad law a new section providing that no demurrage charges shall be imposed by any railroad corporation for delay in unloading freight cars, except by uniform rules and regulations previously adopted, an abstract of which shall be printed on each bill or account for such charges presented to any assignee. When a car is desired and the time and place specified, it must be furnished at any station on the road, and a failure of the company to furnish the car or cars ordered for a period of time equal to or exceeding the time allowed by the rules of the company for unloading by a consignee before the accrual of demurrage charges, shall

Digitized by Google

subject the company to damages in favor of the intended shipper equal to the demurrage charges, as fixed by the railroad company, during the time the furnishing of such car or cars is delayed beyond the time specified in the order therefor.

Rhode Island.—Recent abandonment of construction work on the Southern New England Railway of the Grand Trunk System in Rhode Island is responsible for the introduction in the General Assembly of that State of a bill providing a remedy for any property damage resulting from the road's action. A resolution was also presented asking Congress to enact a law to give the people an interest in the management of all interstate railroads. Senator Edwin C. Pierce, of Cranston, proposed both measures.

The Railway bill provides that when a railroad shall abandon work as in the recent instance of the Grand Trunk, the Superior Court shall, at the request of the Attorney-General, appoint receivers for the railroad corporation. Receivers so appointed may either complete the road or sell it to some other corporation formed for the purpose.

Texas.—It is reported that at the next session of the Texas Legislature, the Missouri, Kansas & Texas will ask for authority to lease the Texas Central, the Wichita Falls Route in the State, and the Beaumont & Great Northern, of which it already has acquired stock control.

Although the legality of the proposition is not questioned, because these are not competing for parallel lines, there is doubt as to what the attitude of Governor Colquitt will be in view of his stand on the proposed merging of the International & Great Northern with the Missouri Pacific.

LABOR.

The Firemen's Wage Controversy.—Interest in labor developments during January, centered around the wage controversy which is being carried on between Eastern roads and their firemen. Early in the month the firemen agreed with the railroad managers to ask Martin A. Knapp, Judge of the Commerce Court and Charles P. Neill, United States Commissioner of Labor to act as mediators under the Erdman Act. After an effort of several days, however, the announcement was made that the mediation conferences would be discontinued on account of the inability of the conflicting interests to get together.

The railway managers then offered to submit the questions involved to a Board of Arbitration, but this proposal was rejected by the firemen. The managers also offered a compromise which included increases in wages affecting nearly all roads and a proposal to submit to a committee the question of two firemen on certain types of locomotives, but this was also rejected by the firemen, and a strike vote for January 31st ordered.

In the meantime, the railroads have issued several statements calling the public's attention to the efforts which have been made to avoid serious difficulty and the refusal of the firemen to agree to either a compromise or arbitration. In one of these statements the railways clearly define their position by declaring that they are prepared to apply to the firemen the conclusions embodied in the award of the Board which recently arbitrated the differences between the locomotive engineers and the railroads. They have also signified their willingness to grant certain increases in wages or are prepared to arbitrate the present case independently by a board of five or seven men appointed by some such disinterested authorities as Chief Justice White, of the United States Supreme Court; Martin A. Knapp, presiding Judge of the United States Commerce Court, and Dr. C. P. Neill, United States Commissioner of Labor, as was done in the engineers' case. It is of interest to note in this connection that under the recent award in the engineers' arbitration case, the engineers received a total annual increase in pay of about $2,000,000 or approximately five per cent.

In a published statement, President Carter, of the firemen objects to the railroad's plan of an Arbitration Board on a plea that there was a great delay in settling the engineers' case and that it was over six months from the time arbitration was agreed on before the decision was rendered. The railroads point out, however, that this statement is misleading as the engineers' increase in wages was retroactive and applied to the whole period of the delay. Though the reward was not made public until November 26th, it was made effective as to May 1st, and the men received back pay amounting to about $1,000,000.

If the firemen decide to strike they will be supported by little public sympathy and subject themselves to the sharpest censure in view of the extraordinary efforts which the railroad officials have made for a peaceful settlement. Eastern managers are frank in their admission that there should be some adjustment in the pay of the firemen, who, as a body, are faithful and hard working. They believe, however, that the firemen are ill-advised both in demanding wages disproportionate to the other obligations of the companies and in declining to accept arbitration by a board sufficiently large to look at the controversy from all points of view and appointed by some disinterested body or committee of citizens.

In their public statement of January 31st, the day on which the strike vote was taken, the railroads called the public's particular attention to the following utterance contained in the award of the engineers' case:

"From the viewpoint of the public it is an intolerable situation when any group of men, whether employes or employers, whether large or small, have the power to decide that a great section of the country as populous as all of France shall undergo great loss of life, unspeakable suffering, and loss of property beyond the power of description, through the stoppage of a necessary public service. This, however, is the situation which confronts us as a nation."

United States Steel Wages Advance.—The United States Steel Corporation has made public its wage increase plan which provides for an increase of a million dollars per month or $12,000,000 a year.

The statement issued by Chairman Elbert H. Gary follows:

"In accordance with the recent announcement

Digitized by Google

made by the chairman respecting an advance in wages, many of the subsidiary companies of the United States Steel Corporation have made up their schedules, which together aggregate an increase in wages of about $1,000,000 per month, commencing about February 1st. These benefits largely apply to the workmen receiving the lowest daily wages. Some of the mining companies are not included, for the reason that wages have been heretofore adjusted by those companies and are now above the average."

Mexican Railway Strike Settled.—The railway machinists' strike, which began December 26th, has been settled. The men are granted a ten per cent. increase in wages, but no reduction in the ten-hour day. The railway management has refused to dismiss the American master mechanic, Schneider, against whom the men had a grievance.

TRAFFIC.

Traffic Developments During January.—Traffic developments continued heavy during January, and while the car situation showed, in the main, satisfactory conditions, the railroads both East and West had all the freight which they could handle. Complete figures are not available at the present time, but indications are that January will make even a better tonnage record than did December. Cold weather during the middle of the month in the Western States caused operating delays but lasted only for a few days. In the Northwest, the movement of merchandise and miscellaneous freight was on so large a scale as to hold back large amounts of grain which would otherwise have moved. The movement of coal was also heavy during the month and lumber shipments were greatly in excess of those for 1912. A heavy grain movement is expected for February.

One of the unfortunate developments of the month was the freezing weather in California, which began about January 6th and extended over a period of about three days, and which has caused a great loss in the citrus fruit section, estimated in some quarters as high as 50 per cent. This will, of course, greatly effect the volume of citrus fruit moved by the transcontinental lines during 1913 and for some years to come.

Reports from Chicago show the grain movement for 1912 to have been the greatest at that port for nine years. The railroads handled approximately 34,500,000 bushels more than in 1911 and 11 000,000 bushels more than in 1909 which heretofore held the record. Lake shipments of coal, both anthracite and bituminous, were also the largest on record, shipments of bituminous reaching 23,335,000 tons, an increase of over 1,500,000 tons as compared with 1911. Shipments of anthracite reached a total of 4,204,741 tons compared with 3,917,419 tons in 1911. The Lake movement of bituminous coal has increased more than 100 per cent. in the past ten years.

The railroads also report an exceptionally heavy travel to various winter resorts, and within recent weeks those catering to the tourists bound for Florida points and Panama have been attaching extra coaches to through trains almost nightly and it is reported that additional equipment is constantly needed on trains going to California and Gulf of Mexico resorts. The situation is unusual in view of the mild northern winter.

Reports from the New York Barge Office show that during 1912, the total number of vessels arriving at that port numbered 9,519 representing practically every civilized nation of the world. Reports from the Pacific Coast states that the Tacoma and Seattle oriental warehouses are piled high with manufactured goods, cotton, wheat and flour, waiting shipment to the Orient. Regular lines are unable to handle all the freight offered.

One of the significant developments of our export trade during 1912 has been the rapid disappearance of meat and breadstuffs from such exports. They show for example, the exportation of but 33,000 cattle in the calendar year against 164,000 in 1911; 277,000 in 1908; 494,000 in 1906; and 599,000 in 1904. The exportation of meat also shows a marked falling off, being but 9,000,000 pounds for the year against 29,000,000 in 1911; 156,000,000 in 1908; 270,000,000 in 1906; and 354,000,000 in 1901. The fresh beef exports of 1912 were less than 3 per cent. of those for 1901. The value of breadstuff exports for 1912 was approximately $277,000,000 as against $965,000,000 in 1901.

The latest figures of commerce between the Atlantic and Pacific Coasts of the United States, via the Isthmuses of Panama and Tehauntepec, indicate a rapid growth in the traffic between the Eastern and Western Coasts of this country. The principal articles in the Western movement include iron and steel manufactures, cotton cloths, paper and manufactures of wool. The eastbound movement includes canned salmon, dried and preserved fruits, wines, wool and sugar.

The Parcels Post.—The Parcels Post continues to be a matter of general public interest. According to official returns six million packages were handled in this manner during the first seven days of the operation of the system. Postmaster General Hitchcock, goes so far as to suggest that the adoption of this system will eventually lead to the absorption of the express companies. These companies have undoubtedly received a hard blow, but that they will tamely submit to being eliminated from the field is another question, and steps have already been taken to vigorously compete with the Government's system.

The attitude of Wells Fargo & Co. is indicated in a letter sent to each employe of the company by President Caldwell. The letter says in part: "The new year has brought to the express company a competitor worthy of its mettle, the new parcel post. It becomes a competitor not only of the company, but of every man in the service, hence the newcomer as an important factor in small parcel transportation is neither to be belittled nor overestimated, but calls most for renewed efforts on the part of Wells Fargo men to maintain the company's standard of service as the basis of public favor and patronage."

Adams Express Company also defines its position in the following statement:

"The company appreciates that the Parcel Post has been established in response to a widespread and persistent demand, and anticipates it has come to stay. The company's policy will

Digitized by Google

be to devote its energies to rendering a service even more efficient and satisfactory than in the past, and all officers and employes are directed to exert every effort to that end. The company does not wish any of its employes to adopt a policy of fault-finding toward the Parcel Post, but expects them by their efficiency to demonstrate to its patrons the necessity for the express company's distinctive service."

Reports from Canada state that the postmaster-general of that country after having sent several officials of the department to the United States to observe the workings of the Parcel Post, has prepared a zone map for Canada, dividing the country into five zones and is about ready to promulgate an order establishing a Parcel Post system for Canada.

Harriman Lines to Dissolve Joint Agencies.—One of the results of the dissolution of the Union Pacific-Southern Pacific system will be the division of traffic departments heretofore maintained as one, as well as the various joint agencies in New York, Chicago, Cleveland, Cincinnati, Pittsburgh and New Orleans.

Britain's Trade Establishes New Records.—Statistics issued by the British Board of Trade show that the imports of the United Kingdom for the year were valued at considerably over $3.500,000,000, an increase of more than $300,000,000 as compared with 1911. Exports were of a value of nearly $2,500,000,000 an increase of nearly $170,000,000. These results exceed all records.

New Record for Trans-Atlantic Travel.—The year 1912 established a new high record in trans-Atlantic travel, with 2,131,929 passengers going over the ocean highway. The total number sailing for Europe was 691,890, while arrivals in the United States were 1,440,038. The largest travel in any previous year was in 1910, with a total of 2,020,276 passengers. Of this number 596,004 sailed for Europe, and 1,424,272 landed in the United States. The 1911 total was 879,481 passengers, of whom 727,115 were emigrants and 1.152,366 immigrants.

Anthracite Shipments During 1912.—Anthracite shipments for December amounted to 5,944,502 tons, a decrease of 170,925 from December of 1911. The shipments for the year 1912 amounted to 63,610,578 tons. a decrease of 6,343,721 tons.

The production for 1912 is high, when it is considered that during six weeks the mines were closed on account of negotiations for a new contract with the miners.

STATE COMMISSIONS.

Canada.—The Board of Railway Commissioners devoted a full week during January to the western freight rate inquiry, and it is felt that a long step has been taken towards the completion of the most important rate case in the history of Canadian Railways. A vast amount of evidence was introduced by the complainants, among whom are numbered the Dominion Government and Provincial Government of Saskatchewan, Alberta and British Columbia, and practically all of the western boards of trade. The case is now over a year old.

California.—The State Railroad Commission has recently issued an order which covers the minimum clearances and character of construction for crossing of railroads, street railroads, telegraphs, telephone, signal, trolley and power lines, with each other, and with street and public highways, and also other overhead and side clearances of railroads, street railroads and wire lines. The commission states that this order shall be observed in California unless otherwise authorized or directed.

The commission has suspended indefinitely its general order No. 20, which relates to the matter of reporting revenue of intrastate steam railroads together with instructions for segregating operating expenses as between freight and passenger.

Indiana.—Inspectors for the State Railroad Commission have been ordered to investigate the work of installing block signals on the Cincinnati, Hamilton & Dayton Railroad between Glenwood and the Ohio line. This action follows the return by the Marion County Grand Jury of indictments charging involuntary manslaughter against sixteen officials and directors of the road and two trainmen, whom the Grand Jury contends were responsible for the collision between a freight and a passenger train in Irvington, a suburb, November 13th, when sixteen lives were lost.

Illinois.—On January 9th, the Railroad Commission held a hearing at which it considered the advance in charge for switching cars loaded with coal within what is known as the Chicago District, proposed by the Chicago, Milwaukee and St. Paul.

Among the complainants in the case are a number of Chicago coal firms. For a number of years the St. Paul company charged Eastern and Southern carriers a rate of $4 a car, with an excess toll of 10 cents a ton when the consignment exceeded 60,000 pounds per car, for coal car switching service.

Announcement was made last November that the company would change its switching charges and assess connecting carriers $6 a car for all cars loaded with coal which were handled by it within its Chicago switching territory. It was contended that the former rate was not sufficiently remunerative. Connecting lines operating in Eastern and Southern territory soon afterward filed tariffs setting forth that they would absorb the old switching rate and that the increase would be assessed against shippers. These tariffs were suspended by both the Interstate Commerce Commission and the Illinois Railroad Commission.

The Illinois Commission ruled in 1908 that $4.50 was a reasonable amount for switching a car loaded with coal within the Chicago District and was enjoined from enforcing this order by the Federal Court.

Louisiana.—The Railroad Commission has issued a ruling to the effect that all railroads operating in Louisiana, upon the receipt of any live stock for transportation, shall without delay transport the same on the first train passing in the direction of the destination, unless the said live stock can be delivered in shorter time than by a direct shipment. The said shipment shall not be delayed for any purpose unless for feed

Digitized by Google

and water, and any railroad handling live stock over its lines shall feed, rest and water said live stock every twenty-eight hours, unless the shipper or his agent shall consent, in writing, to a release to thirty-six hours for feed and water.

Massachusetts.—In its annual report the railroad Commission states that: "It is the consensus of intelligent opinion at the present time that the New York, New Haven and Hartford Railroad system has already exceeded the proper limits of combination, and that unless it proceeds voluntarily to divest itself of some of the properties now held by it there is little doubt that some other effectual means will be found for accomplishing that result."

The Commission says that the road already has taken steps in this direction, in connection with the recent act of Congress relating to the Panama Canal, by arranging for the disposal of its steamship lines. It continues: "The management is apparently doing everything in its power to meet the demands for better service. Nevertheless, it seems imperative that some action be taken by the public authorities to assert a more effective control over the system and to secure from it the proper performance of the obligation it has voluntarily assumed of supplying the transportation requirements of the commonwealth."

It also states that:

"The present attitude of the public toward the New Haven interferes seriously with the efficient operation of the railroad, and is prejudicial to the company and to the public alike. What is most needed is some settlement that will lead to a constructive programme of railroad development through the co-operation of the New Haven with the public authorities. This settlement, however, must be made in a manner to meet the reasonable requirements of the public, and in conformity with the general policies of the Commonwealth.

"We are hopeful that the New Haven, insofar as it may be held responsible for present conditions, will be ready to make such concessions as may be reasonable and proper, in order to establish a more friendly relationship with the people. Any failure on the part of the company to adopt this course will force the public to give serious consideration, at whatever cost, to the adoption of a policy for the control of railroad transportation more radical than any heretofore in this Commonwealth."

Michigan.—The Grand Trunk has applied to the Railroad Commission for permission to double track portions of the outer belt line, known as the Detroit Terminal Railway, of which the Grand Trunk owns half, the Michigan Central one quarter, and the Lake Shore one quarter. The belt is operated jointly. Improvements will cost upward of $1,000,000.

The Commission has authorized the Chicago & Northwestern Railway Company to issue $10,000,000 of bonds for the purchase of new equipment. Application was made and a hearing given by the commission in the matter some time ago. The company is ordered to issue the bonds in ten yearly installments.

New Jersey.—According to a recent report of the Board of Public Utility Commissioners made to Governor Wilson the plan to compel the railroads of the State annually to eliminate a certain number of grade crossings might bankrupt several of the smaller companies. It is held by the board that the only satisfactory solution of the great problem will be through a recognition of the justice of distributing the cost between the carriers and the public, as represented by the State and municipalities. The board says that the State will be fortunate if by the end of two decades it sees the removal of all grade crossings.

The report of the commission is interesting in that it expresses the ideas entertained by Governor Wilson on the grade crossing question. At the last session of the legislature he vetoed a grade crossing bill because he feared it would do just what the commission suggests, bankrupt many of the smaller companies.

New York.—The annual report of the Public Service Commission second district, compares the results of the operation of steam railroads within the State for the fiscal years ending June 30, 1907 and June 30, 1912. This comparison shows that the total operating revenues have increased 14.60 per cent.; operating expenses have increased 14.20 per cent.; net revenues from operation have increased 15.60 per cent.; tons of revenue freight carried have increased 8.10 per cent; ton-miles of freight carried have increased 11.90 per cent.; passengers carried have increased 20.30 per cent.; the total revenue passenger-miles have increased 20.60 per cent.

Dividends declared in 1907 amounted to $75,178,807, and in 1912 to $96,956,844. The per cent. of increase in business in 1912 over that of 1911 was as follows: Operating revenues, 2.57; operating expenses, 2.45; net revenues from railroad operations, 2.84; tons of revenue freight carried, 2.99; ton-miles of freight carried, 2.84; passengers carried, 2.57; total revenue passenger-miles, 2.49; while dividends have increased from $79,768,181 to $96,956,844. The total operating revenues for 1907 were $566,744,845; for 1912 they were $649,522,995. The net revenues from railroad operations for 1907 were $168,382,602; for 1912 they were $194,632,783. The tons of revenue freight carried in 1907 were 414,302,051; in 1912, 447,974,051. The number of passengers carried in 1907 was 322,238,260; in 1912 there were 387,744,001 passengers carried.

In discussing car shortage conditions and their remedies the commission states that a thorough investigation was made of this matter during the past shipping season and it was found that a considerable number of shippers seem to think that they had the right to use cars as warehouses for any length of time they might see fit, with the result that the railroad was deprived of the use of cars which should be kept moving, and they find themselves unable to supply cars to other shippers by reason of the excessive time taken by the shipper in loading and billing out after the car is received by him. The commission points out that this conduct on the part of the shippers is not only a wrong to the railroad, but a greater wrong to other shippers, who are thereby deprived to some extent of cars which are needed in their business. The commission has frequently remonstrated with shippers upon this practice, which

Digitized by Google

has never been defended nor even excused; but still the practice continues.

During the month of November, the commission found 122 cases where cars were held for periods of from 5 to 25 days idle upon sidetracks, and gives a list of these in full in its report. In its investigation, it has also discovered nine cases in September, 23 in October and 30 in December. The commission believes that this situation is one of sufficient importance to be made public, and that it may have the effect of wiping out in succeeding years the practices to which attention is called.

During the year 1912 the commission authorized the issuance of stocks to the amount of $30,602,055, and bonds to the amount of $96,817,446.19; a total of $127,419 505.19. The total capitalization authorized by the commission from July 1, 1907, to December 31, 1912, amounted to $693,889,009.05.

Recommendation is made to the Legislature for the "re-passage of the law vetoed by the Governor last year without stated and specific reasons therefor, empowering the commission to suspend increases in railroad rates pending investigation as to the reasonableness of such advances."

Recommendation is also made that the Public Service Commissions Law be amended, authorizing the commission to protect shippers in cases where the agent of a railroad quotes an erroneous rate and the shipment has moved on an under-rate quotation resulting in damage to the shipper and without collusion on his part.

The Commission has authorized the New York Central Railroad Company to issue $12,547,000 of trustees' certificates under its equipment trust of 1913. The proceeds are to be used for the purchase of various apparatus in this and other States.

The record of passenger train performances on the steam railroads in this State for November, shows that 62,184 trains were run during the month and of this number, 82 per cent. were on time. The average delay for each late train was 25.9 minutes, and the average delay for each train run was 4.6 minutes.

Ohio.—The Public Utilities Commission has given official sanction to a bond issue of the New York Central Railroad to the amount of $13,500,000 to be used for new equipment. The approval given concerns only Ohio. Permission has also been granted to the Ohio River and Northern Railroad to issue $1,000,000 in capital stock and $2,500,000 in bonds. The money thus to be derived is to be used in constructing the extension of the Erie Railroad System from Youngstown, Ohio to Pittsburgh. This appears to be a direct invasion of the territory of the Pennsylvania lines which thoroughly covers and controls all the territory between Youngstown and Pittsburgh. The new Ohio River & Northern road will connect at Lisbon with a branch of the Erie that at present extends to that place from the Erie's main line at Youngstown.

Pennsylvania.—The annual report of the State Railroad Commission recently submitted to the governor, recommends that the powers conferred upon it be so increased that it could make recommendations and give directions with respect to safety appliances and regulate the crossing at grade of railroads and trolley lines with roads.

The report refers to the multiplicity of telephone systems as a source of needless annoyance and expense and recommends legislation compelling the interchange of messages.

The commission furnishes statistics showing that in the five years of its existence 420 persons were killed on grade crossings within the State. Last year the total fatalities from all causes on steam railroads were 1,179 and non-fatal accidents 11,034. There was an increase in the killed of 65 and in the injured of 2,858.

On the street railways 177 people were killed and 4,052 injured, a decrease of 16 in the number killed, but an increase of 300 in the injured. The fatalities embraced 14 employes, 18 passengers, 26 trespassers and 119 others.

The fatalities embraced 452 employes, 28 passengers, 583 trespassers and 116 others. There were 101 grade crossing fatalities, 21 more than during 1911, while 257 persons were injured.

The commission recommends that railroads enclose their rights of way to exclude trespassers and also suggests that railroads should put out all forest or country fires occurring within 100 feet of their tracks. During the year the commission held 114 meetings and considered 201 complaints.

The commission has recommended that the freight rate on bituminous coal from the Clearfield region to Lancaster be reduced from $1.50 to $1.40 per ton. The commission holds that the present rates of $1.30 to Harrisburg, $1.50 to Lancaster and $1.60 to Philadelphia are inequitable and discriminatory against Lancaster, since the rate to the city involves a charge of 20 cents for 36 miles between Harrisburg and Lancaster, while the Philadelphia rate includes only 10 cents for the 69-mile continuation of the haul from Lancaster.

Texas.—The State Railroad Commission has blocked the plans of the Missouri Pacific to take over and consolidate the International & Great Northern with that system.

Chairman Allison Mayfield has publicly announced that if the pending merger plans are carried out the Railroad Commission would instruct the attorney-general to file suit to forfeit the charter of the International & Great Northern for alleged violation of the laws and constitution of the State.

The Railroad Commission has instructed the attorney-general to file suit against the Southern Pacific and the Santa Fe for penalties for violation of the order requiring the running of passenger trains on time. The Southern Pacific is to be sued for $30,000 and the Santa Fe for $250,000.

It is claimed by the Railroad Commission that the operating expenses of the International & Great Northern for the fiscal year ended June 30, 1912, were abnormally large. In order to ascertain the details of these expenditures an investigation of the books of that railroad will be made by the auditing department of the railroad commission. The report shows that the operating revenues of the road for the last fiscal year aggregated $10,358,773 and the operating expenses $7,548,774. It is planned by the Railroad Commission to make a careful study of the items that are charged to operating expenses.

LEGAL.

Railroad's Right to a Hearing.

The Interstate Commerce Commission met with a decided defeat at the hands of the Supreme Court on January 20th, in its attempt to establish a right to make rates without substantial evidence being presented at a hearing to show an unresonableness of rates about to be replaced.

In discussing the Court's decision, the "New York Journal of Commerce" has the following editorially, to say:

"It appears that the Interstate Commerce Commission had issued an order reducing certain class rates in the South without giving the railroad affected a chance to be heard in defense of the reasonableness of the rates it had established. The law empowers the Commission to require rates to be reduced if it finds them to be unreasonable after a 'hearing.' In this case at such hearing as was given only the complaining shippers were heard, or representatives of the localities affected. It seems to have been assumed that this was within the discretion of the Commission and that no court was entitled to review its exercise of such discretion.

"The Supreme Court holds that the Commission has no authority to prescribe rates based upon investigations of its own and upon its own judgment as to what they ought to be. They must be based upon evidence obtained at a hearing where the railroads have an opportunity of presenting their own side of the case. Whether substantial evidence has been given which supports the conclusion of the Commission is a question of law for the courts to review. The government had contended to the contrary in the suit, but the Supreme Court sustains the right of the railroad to be heard and to appeal to the courts if an opportunity is refused.

"In reply to the government's contention in the suit that as Congress required the Commission to obtain information to enable it to perform its duties, it was to be presumed when it issued an order that it had obtained such information to support its finding, Justice Lamar, handing down the opinion of the Court, says: 'Such a construction would nullify the right to a hearing, for manifestly there is no hearing when the party does not know what evidence is offered or considered, or is not given an opportunity to test, to explain or to repudiate it.' Information gathered by the Commission in its own way may be used as a basis for prosecutions for violation of the law and for 'many other purposes,' but it will not serve in 'cases where the parties are entitled to a hearing.' This seems reasonable. There would be little safety to rights in allowing the contrary, and even railroads have rights."

"Corners" Illegal.—As stated more fully in another section of this issue, the Supreme Court of the United States on January 6th, declared "corners" in commodities on the market illegal under the Sherman Anti-Trust Law, and held for trial in the New York Federal Courts, James A. Patten, a Chicago grain operator and his associates for alleged "corners" of the cotton market in 1910.

Minnesota Demurrage Law Illegal.—The Supreme Court of the United States has declared the Minnesota reciprocal demurrage law of 1907 to be invalid, in its decisions in the case of the Rock Island Railroad against the Hardwick Farmers' Elevator Co. The law prescribed a penalty on railroads of $1 a day for failure to supply freight cars to shippers.

The decision of the Minnesota Supreme Court upholding this law was reversed. Several States have similar laws.

Union Pacific's Stock Plan Denied.—The plan proposed by Union Pacific Railroad attorneys "for dissolving" the Union Pacific-Southern Pacific Railroad by allowing the Union Pacific stockholders to have the exclusive privilege of buying the Southern Pacific stock now owned by the Union Pacific Railroad corporation has been rejected by the Supreme Court of the United States.

Reargument of "Full Crew" Suit Ordered.—The Pennsylvania Supreme Court has ordered a reargument of the case of the Pennsylvania Railroad Co. vs. the State Railroad Commission, on the sole question of jurisdiction. This is the case to determine the constitutionality of the "Full Crew" act.

Vermont's Demurrage Law Declared Void.—The State Supreme Court of Vermont has declared the four-day railroad demurrage law illegal on the ground that it conflicts with the Interstate Commerce Law.

Injunction Sought in Tap Line Case.—Tap line railroads have filed a petition with the Commerce Court asking for injunctions in the lumber tap line case.

The petitioners ask to be protected from the order of the commission in which they are held not to be common carriers, or in the case in which the lumber companies are petitioners with their tap lines, they ask that the commission be required to consider their complaints that the trunk lines discriminate against the complaining shippers and the tap lines in refusing to establish and maintain through routes and joint rates.

Grade Crossing Ruling in Missouri.—The Supreme Court of Missouri recently held that cities have the power not only to abolish grade crossings but also to require by city ordinance, the depression of tracks.

Louisville and Nashville Enjoined.—The Federal Court at Louisville has granted an application for an injunction by the Western Union Telegraph Company, to prevent the Louisville and Nashville Railroad from removing the Telegraph Company's equipment from the road.

Express Company Liability.—The Supreme Court of the United States has limited the liability of express companies for loss of packages at full value upon which the sender places a lower value to obtain a lower rate. The Court holds that the Carmack Amendment of the Interstate Commerce Law, indicates that Congress did not intend to make the carrier responsible for the absolute loss, but only such loss as may be due to its own negligence. The carrier, it was held, had the right to protect

Digitized by Google

itself against fraud by reasonable rules and regulations and the fixing of two rates according to the value of the article was declared reasonable.

Decision in Soft Coal Suit.—The United States Court at Columbus has ordered that the equity of the Lake Shore and Chesapeake and Ohio in the capital stock of the Sunday Creek Coal Company, shall be disposed of by absolute sale. It also orders that the joint ownership and control of the Kanawha and Michigan shall be terminated.

LAND AND INDUSTRIAL.

'Frisco Lines Organize Department of Development.—The 'Frisco Lines began the New Year with a thoroughly organized Department of Development, covering all the territory along its lines.

The industrial, agricultural and immigration work, heretofore carried on through several departments, will after January 1st, be consolidated into one department known as the "Department of Development," one of the 'Frisco's principal objects being to carry to the farmer through its staff of thoroughly equipped agricultural specialists the latest improved and scientific methods of planting, cultivating and harvesting as the same have been determined by the National and State agricultural authorities.

For this purpose, picked agricultural specialists will be located at different points throughout the 'Frisco's territory, whose sole duty it will be to co-operate direct with the farmers. These agriculturalists will have defined territories within which demonstration farms will be established and conducted under the supervision of the railroad company's agricultural representatives, together with the representatives of the National and State Agricultural Departments.

Included in this work will be every branch of farming, dairying, horticulture, poultry raising and stock farming. Such a plan as this will not only materially aid the farmers in increasing their production, but by producing a better article and properly preparing it for market, they will necessarily increase the price of their products.

Such work as this not only benefits the farmer already located, but will be invaluable to the new settler who will at once be informed of the country's resources and possibilities. For this purpose the railroad's agricultural representatives will keep in constant touch with the new settler and aid him in every practical way that will insure his success.

In brief, all branches of the Department of Development will work closely together, and deal with both the old and new settler personally, and encourage in every proper way the development of all the country tributary to 'Frisco rails.

The plan adopted by the 'Frisco is an entirely new one—determined upon after months of investigation in both the United States and abroad, and is the embodiment of the best and most practical methods that could be found.

Demonstration Farms on the Missouri-Pacific.—The Missouri-Pacific Iron System, under the direction of its Agricultural Department is establishing an extensive system of demonstration farms to co-operate with the farmers along its lines.

The company has already established five large demonstration farms and expects to soon have a sixth in operation. These farms range in size from twenty-five to forty acres which makes the undertaking the most pretentious yet inaugurated. Work will be conducted along the same lines as the Government demonstration farm work, but will be on a much larger scale which will make it relatively more valuable.

The United States Department of Agriculture will co-operate directly in conducting these farms and have field agents representing them and the State Agricultural Colleges of Arkansas and Louisiana and the State agents are giving unreserved co-operation in directing the experiments. Each farm is to have a resident manager, and each is to be located along the tracks of the Company's lines in close proximity to a town. The railroad will continue to experiment for at least three years regardless of results, and if at the expiration of that time the work has proved as successful as anticipated, it will be continued indefinitely and both the size and the number of the demonstration farms will be increased. Seed will be sold at reasonable prices to farmers in the surrounding country, and lessons in actual field selection of seed will be given on the ground by expert agriculturalists.

Illinois Central Establishes Additional Experimental Farms.—Twenty-six experimental farms are to be established along the lines of the Illinois Central. Fifteen will be located at various points on the Central of Georgia Railroad and eleven on the lines of the Illinois Central proper. Most of the new farms along the latter line will be in Mississippi.

According to a plan adopted some time ago agreements are made with farmers to direct the cultivation of certain parts of their farms and a guarantee is given to protect each farmer from loss on account of crop failure. A number of farmers have entered into competition with the experimental farms and in several instances, it is said, have achieved more successful results.

Success of the New Haven's Industrial Bureau.—The industrial bureau of the New England lines, which is conducted by the New York, New Haven & Hartford and the Boston & Maine roads, reports that during the first eighteen months of its activities 68 new manufacturing concerns were established in New England.

NEW ROADS.

Illinois.—The Central Illinois Public Service Company have been purchasing power and lighting plants in numerous cities and towns of central Illinois with the expectation of building a net work of interurban lines in that section of the State. It is understood that a large corporation will be formed to acquire new plants, extend the interurban railroads now owned by the Company and build new lines. It already owns a traction line extending from Mattoon

Digitized by Google

to Charleston. Extension of its line to Pana and thence to Harrisburg has begun. Branch lines from Pana to Taylorville and Nokomis and a possible extension to Springfield are contemplated.

A company known as the Alton, St. Louis and Cairo Railway Company has been organized with the chief office in St. Louis. The road is to be built between Alton and Cairo, somewhere near the route of the Iron Mountain road. The promoters are: Col. Thos. N. Chase, president; W. R. Borders, vice-president; Adam Hoffman, Sr., secretary and treasurer; W. R. Journey, financial representative; Baxter Brown, consulting engineer and ex-Lieutenant Gov., Chas. P. Johnson and Alexander Young, counsel.

Col. Chase, the president, has been identified with railroad projects for many years. The St. Louis offices are located in the Navarre Building, St. Louis.

Iowa.—A new railroad company has been organized by a group of Burlington, Iowa, business men in combination with outside capital to build a railroad from Burlington to Beardstown, Ill., where a connection will be made with the Baltimore and Ohio Railroad. The road will be known as the Burlington Belt Line.

Kansas.—Contracts have been let for the building of a St. Louis-Kansas City Electric line, and it is reported that work will proceed in the immediate future.

Kentucky.—Articles of incorporation for the Caney Railroad Company of Prestonburg, have been filed with the Kentucky Secretary of State and State Railroad Commission. It will be a standard guage railroad and will branch off from the Chesapeake & Ohio Railroad in Floyd County and follow the middle branch of the Big Sandy River to Beaver Creek, where it will tap the coal fields in Eastern Kentucky. The incorporators are James Salisbury, B. F. Combs, M. Flannigan. W. T. Hite, W. P. McVay, W. W. Brown and A. Flannigan.

Missouri.—The Cape Girardeau Northern Railroad Company, capitalized at $2,500,000, has been chartered by the Secretary of State.. This concern proposes to build a line ten miles in length, connecting Flat River and Farmington. The incorporators are: J. H. Byrd, A. R. Byrd, Geo. W. Simmons, G. H. Walker and Albert T. West.

Nebraska.—Active work started January 1st on the Dakota & Gulf Railroad, projected between Kearney and Beloit, Kansas, a distance of 125 miles. It is reported that the line is financed by English capital, assisted by bond issues of the different towns and counties through which it passes.

Nevada.—Press reports state the former United States Senator W. A. Clark, who owns the United Verde copper mine, is preparing to construct a railroad from Clarksville to Phoenix. The distance by the route that will be followed by the new line will be more than 100 miles. The survey for the proposed road is now being made.

New York.—The Liberty & Callicoon Railroad Company has been authorized by the Public Service Commission to build a railroad to connect Liberty and Jeffersonville in Sullivan County, a distance of 14 miles. The road will pass through Loomis, White Sulphur Springs, Youngsville and Callicoon.

Ohio.—The Lake Erie & Youghiogheny Railroad has been incorporated with a capital of $3,000,000 to connect Youngstown and Conneaut, Ohio. Bonds will be issued and construction work will be started as soon as the weather permits. Although the road was chartered as a steam railroad, it will be operated by either gasoline or electricity. Incorporators are: A. W. Jones, former Lieutenant Governor of Ohio; John H. Ruhlman, William H. Ruhlman, George J. Chapman, and George M. Brown.

Texas.—It is reported that plans are on foot for the construction of a line of independent railway to run from Beeville to Laredo, about 150 miles. It is claimed that a state banking institution has agreed to finance the project. A line such as proposed would give a large section of South Texas a new and short route to the Mexican border. It would connect also with the San Antonio & Aransas Pass at Beeville and with the International & Great Northern, the National Railways of Mexico and the Rio Grande Railroad at Laredo.

The San Antonio and Austin Interurban Railroad Company has just been organized and its charter filed in the secretary's office. Its purpose is to construct an interurban electric railway between Austin and San Antonio, about eighty-five miles. The list of incorporators includes a large number of bankers and other business men in Texas.

The route of the proposed line will be through the towns of Davenport, New Braunfels, Hunter, San Marcos, Kyle, Buda, Manchaco and several smaller places. It is roughly estimated that the construction and equipment will cost approximately $3,000,000. The present corporation has a capital stock of $25,000 and it will be succeeded by a larger corporation, which will be organized later to finance the actual construction. The directors of the company for the first year are: Vories P. Brown, W. B. Tuttle, Jesse O. Oppenheimer and Sam C. Bell of San Antonio; H. G. Henne, New Braunfels; C. L. Hopkins, San Marcos, and A. J. Eilers, Austin.

CONSTRUCTION.

Railroad Construction in the South.—In an elaborate summary of railroad construction in the South, the "Manufacturers' Record" shows that 2,026 miles of new road was built in 1912 exceeding the 1911 record by 200 miles. Plans for the coming year according to this statement look to the construction of nearly 3,000 miles of railroad in the South. Texas led in the year's construction with 348 miles to her credit; Oklahoma came second with 211, and South Carolina third with 171.

Work on the Columbia River Line.—Construction work on the Great Northern's Columbia River line is more than half finished between

Digitized by Google

Wenatchee and Pateros. Work on the long tunnels is progressing rapidly.

Extension Plan of the Santa Fe.—The Atchison, Topeka & Santa Fe is planning to build an extension this year from Englewood, Kan., to connect with the Golmar cut-off, somewhere near the corner of Oklahoma, Kansas and Colorado.

Missouri Pacific Cut-Off.—The Missouri Pacific-Iron Mountain system has just completed the cut-off between Memphis and Mariana, Ark., and begun operation of trains over the new line.

Improvements on the M. K. & T.—It is the plan of the management of the Missouri, Kansas and Texas to make improvements in the roadbed and in operation of the line in Texas during the year. Approximately more than $2,000,000 will be expended.

The road also expects to extend its lines both in Texas and Oklahoma during the year.

Southern Pacific to Build New Line.—After three years' effort the Southern Pacific has succeeded in acquiring the last section of right-of-way for a low grade line over the Tehachapi Mountains between Mojave and Kern City to cost $10,000 000. The late decision of the court of last resort ordering a dissolution of the merger with the Union Pacific is responsible for the building of this road.

Double Tracking on the Southern Railway.—The Southern Railway is soon to let contracts for the construction of double track north from Monroe, Va., the southern terminus of the Washington Division of the Southern Railway, to Amherst, Va. This improvement, when completed, will be materially helpful in the movement of trains on the Washington Division into and out of the Monroe terminal.

Extensive improvements have also been begun on its line between Richmond, Va., and West Point, Va. The entire line will be relaid with heavy section rail, and the track reballasted.

Three New Tunnels for the Pennsylvania.—President Rea, of the Pennsylvania Railroad has authorized the construction of three double-track tunnels ranging from 2,500 to 3,500 feet in length and costing approximately $1,500,000, on the Allegheny Valley Railroad between Kiskiminetas Junction and Oil City. The tunnels will shorten the line between Pittsburgh and Oil City by 14 miles.

Double Tracking the Northern Pacific.—The Northern Pacific is to double-track its railroad for twenty-four miles across the summit of the Cascade Mountains at a cost of $750,000.

Double-tracking will extend from Lester, on the Western slope, to Easton, on the east side. The purpose is to enable both passenger and freight trains to make better time across the mountains.

To Shorten the St. Paul.—A surveying party of the St. Paul is now in the vicinity of Great Falls, Montana, for the purpose of establishing the easiest grade possible for a new line for the St. Paul which will cut off over 100 miles from the present line. The new line will be from Lewistown to Great Falls and directly over the Continental Divide, and will connect with the present main line at Bonner.

Soo Line to Cross the Rockies.—President Pennington, of the Soo Line, has announced two extensions from North Dakota into Montana. The Ambrose Line will be extended across Divide County, North Dakota, and eighty-one miles of new road laid which will carry it across the Montana boundary and about fifty miles into Valley County.

President Pennington said that with the plans for this extension and for another extension from Plaza to the Missouri River, about 140 miles of new road in all have been approved. No other extension work is definitely determined upon.

EQUIPMENT.

The Equipment Outlook.—Developments during the first month of 1913 were entirely satisfactory so far as equipment companies were concerned. Not only have all the companies a large aggregate of orders on their books but the demand during January was unusually strong and there is at the present time no indication of a let up. Rail mills in the Pittsburgh district are running at full capacity and heavy orders are constantly being placed. It is estimated that the mills of the country have on their books for 1913 rolling, close to 2,200,000 tons of standard and heavy girder rails, which is the largest January showing in the history of the rail trade. Car and locomotive purchases also continue heavy in spite of the fact that November and December were probably the heaviest two consecutive months in four years.

The consensus of opinion among officials of leading equipment houses is that 1913 will be one of the most prosperous periods in the history of the industry. When it is considered that these companies are at present operating at their full capacity and that orders are booked sufficient to maintain plants at such capacity into the second quarter of the year and that prices are from 15 per cent. to 20 per cent. higher than they were last June, there appears good reason for their hopeful attitude. A recent report from the Baldwin Locomotive Works, states that the company has now enough orders booked for 1913 to keep it running at capacity for at least eight months.

Recent Equipment Orders.—Among the important equipment developments for the month, was the request for bids made by the Pennsylvania Railroad with the view to the purchase of 12,300 new freight cars involving an expenditure of approximately $16,000,000. This is reported in greater detail in another section of this issue. A recent order placed by the Northern Pacific involves an expenditure of $10,000,000 and includes the purchase of fifty Mikado, ten switch and ten Mallet locomotives, besides four thousand box cars, 2,625 refrigerator cars, 250 stock cars, 1,000 Gondola, 200 ore cars, 500 flat cars, 300 automobile cars and 60 oil tank cars. The Harriman line's recent orders also involve an expenditure of some $20,000,000 for the purchase of 246 engines and 12,500 cars.

Digitized by Google

A new order of the Illinois Central includes 3,500 Gondola coal cars. Another Western road, the Santa Fe, has recently placed orders to the amount of $5,000,000 which cover a large consignment of both freight and passenger cars, the latter being of all steel construction.

Automatic Train Stop.—Among the automatic train stop devices which have recently been tested by the train control board of the Interstate Commerce Commission on the working tracks of several railroads, is one manufactured under patents owned by the Railway Automatic Safety Appliance Co., of Du Bois, Pa. The operation of this device is mechanical, as distinguished from those using electric devices in the engine. It consists of an arm supported on a standard beside the track, controlled either by or independent of block signals. When a block or a switch is closed against an approaching train the arm is in a position to trip a small catch located on the breast beam of the locomotive, opening the train air line and setting the brakes. This appliance is made in types for both manual and automatic operation, the latter using either electric control of the track stand or electric-pneumatic. It is asserted to be a fully developed and dependable apparatus, of few parts and simple in operation.

NEW PUBLICATIONS.

The Story of Panama.—The new Route to India. By Frank A. Gause and Charles Carl Carr. Boston: Silver, Burdett & Co.

Columbus, if he happens to be in a state to observe the progress of the world, doubtless rejoices to note that the route to India, which he sought more than four centuries ago, is about to be completed. An account of the Panama Canal is necessarily much like a news story—a narrative of progress that cannot be completed until the great waterway is opened; but this little volume contains an excellent summary of the work to date. The authors are officials of the school department of the Canal Zone, and their work obviously is authentic and unprejudiced, and it is written in the vivid, direct style characteristic of the newspaper writer.

Half of the volume is devoted to the canal, its inception, its construction and the administration of the Zone; and the remainder covers briefly the history of the Isthmus. As a short history of Panama and the Canal the volume may be strongly recommended, and it is especially well adapted for schools as supplementary reading for classes in history and civics.

An Invitation to American Farmers.—"An Invitation to American Farmers" is the title of a handsomely illustrated folder just issued by the Southern Railway, calling attention to the Fifth National Corn Exposition, to be held at Columbia, January 27 to February 8, 1913. A large number of these folders will be circulated among northern and western farmers and they will also be placed in the hands of farmers throughout the south.

The folder not only sets out the attractions of the National Corn Exposition but gives interesting facts concerning the agricultural possibilities of the South which should appeal especially to farmers in other sections of the United States.

In getting out this folder the Southern Railway is aiming to co-operate for the success of the National Corn Exposition at Columbia and at the same time to call attention to the South as a corn country in the hope of attracting desirable farm settlers to this section.

TRADE NOTES.

Motor Truck Development.—Fifty thousand motor trucks and delivery wagons is believed to be a conservative estimate of the number now in use in the United States. Carefully compiled reports made at the beginning of the year showed that there were then, in round figures, close to 30,000, and State and city registrations of motor vehicles compared with those of a year before proved that the number of these vehicles is doubling annually.

Estimates of the probable production for the coming year vary widely, because many motor car manufacturers can regulate their output to c rrespond with demand. Based on the rate of increase in the past, the output should reach about 50,000.

Rapid as has been the yearly increase in the number of pleasure automobiles, the percentage of increase in trucks and delivery wagons has been almost twice as great. There are more makers of commercial cars in America now than there are manufacturers of pleasure vehicles, the list comprising more than 300 names.

Motor vehicles are used for industrial, commercial, municipal and federal purposes by more than 250 distinct lines of business. More than 4 000 are operated in New York City and more than 2,000 are registered in Chicago.

The total average cost of operation and maintenance of gasoline machines ranges from about $8.50 per day for a one-ton truck, to $18.50 a day for a ten-ton truck. The average for electric vehicles is approximately two-thirds of these figures, but their mileage is proportionately less. It costs a little more than $5.50 a day to keep and use a one-horse outfit and $8.50 a day for a two-horse team, but a horse or team cannot average more than fifteen miles a day against from fifty miles for a five-ton motor truck to 100 or more for a one-ton truck.

The recent motor truck exhibition at Madison Square Garden, New York, was a pronounced success and was visited by representatives of thousands of companies located in the New England, Middle Atlantic and Southern States. Much interest was manifested in the various trucks exhibited and a pronounced stimulation in this trade is predicted for the present year.

At Chicago from February 10th to 15th, will be held an exhibition of commercial motor vehicles similar to that held in New York, and it is stated that the display will be larger and more diversified than ever. Sixty-five motor truck and delivery wagon companies have contracted for space and there is a waiting list of belated applicants. In all there will be on exhibition about two hundred and fifty different models of motor vehicles suitable to every kind of industrial, commercial, municipal and federal purposes.

VOL. LVII. MARCH, 1913 No. 3

Important Developments in the Transportation Field

NOTEWORTHY ADDRESSES BY PROMINENT MEN

Among the points of superiority which the Englishman claims over the American, is the finer quality of English post-prandial and political oratory. When an Englishman, prominent in the business or political world, rises to speak he is expected to say something worth listening to, and usually does not disappoint his audience. Some of the most important deliverances of British Cabinet policy have been made at public meetings, and many of them at banquets and other celebrations. In the United States, until quite recently, little could be said in praise of the public speakers. Political speeches were, with a few shining exceptions, pure bunkum, often written by secretaries or other subordinates, and sometimes prepared by bureaus. Addresses by men not in politics were usually composed of colorless and, therefore, innocuous platitude, often garnished by ancient anecdotes, and usually tiresome and tedious in the extreme. Our political speeches have not greatly improved. The last few years have, however, seen a revolution in the style and substance of business men's utterances. The higher officials of corporations, unable to place their side of the various controversies, to which they were parties, fairly before the public in any other way, have resorted to the method of public address. Their speeches, as a result, so far from being calculated to conceal anything of interest or importance, have grown amazingly frank and correspondingly interesting.

The past month has been noteworthy for several important utterances by the leaders of American industry. Perhaps the most interesting deliverance of this character was the address of Howard Elliott, president of the Northern Pacific Railway Company, before the Rotary Club of Superior, Wis. Mr. Elliott discussed an old subject in a new way. His theme was the familiar one of fair treatment for the railroads. In support of his position, however, he brought forward some facts which, while of peculiar interest to his auditors, are also of national

HOWARD ELLIOTT,
President Northern Pacific Railway.

importance. From 1896 to 1912, President Elliott said, the Northern Pacific had expended for permanent improvements and betterments on its property, all of which were properly chargeable to capital account, $220,000,000. This vast sum, however, must be largely increased in the next few years if the Northern Pacific is to perform the service which it is capable of and which is demanded of it. For example:

"Superior has right at its door about 1,000 square miles, or about 700,000 acres of land that is practically not used. The soil is known as 'Superior clay.' It is productive when properly treated, and experiments made on the State experimental farms show that excellent crops of cereal grains, food vegetables, including potatoes, corn and berries, can be produced, as well as clover, timothy and other forage crops. This great area is well situated and adapted for dairy and hog raising—with a ready market close by and far off through rail and water transportation now in existence. Have not Superior and the State neglected an opportunity here while they have either actually or passively permitted the time and energy of their law makers to be taken up with matters not really so important to them?"

In spite of this clearly perceived need for railroad expansion, and in spite of the admitted impossibility of securing large amounts of capital for the construction of

Digitized by Google

these new facilities, the people of the Northwest persist in their agitation against the railroad. In the seven States in which the Northern Pacific operates, the various legislatures in 1911 considered 230 bills concerning railroads, most of them conceived in a spirit of antagonism to railroad interests; and yet, so far from deserving this hostile treatment, and laying aside all claims to favorable consideration because of their service in building up the country, the railroads of this section are performing their routine public service of transportation with extraordinary efficiency. On the Northern Pacific, for example, there are about 10,000,000 separate consignments of freight that must be handled each year, receipted for, waybilled, and handled at destination. Last year the company received 126,176 claims for over, short or damaged freight, only 1.25 per cent of error. The company handled 1,825,000 pieces of baggage and there was one claimed error for every 4,138 pieces handled. "There were 8,661,645 revenue passengers carried. Of these one was killed because he jumped off a moving train, and one infant died because its mother fell down on the child on the station platform. There were 250 cases of injury to passengers, or one casualty to every 34,500 people carried."

This record, as President Elliott claims, should entitle the Northern Pacific to the most favorable regard of the communities which it serves.

In a final word as to how the present position of the railroads can be greatly helped, Mr. Elliott said:

"Each of you have a vote and a voice and help to make public opinion in your town, county and State. If the legislatures in many Western States which are now in session consider more carefully than they ever have before the wisdom or necessity of not putting new burdens and restrictions on the railroads, the position of the latter would be greatly benefited. Many of the things that cause ill-feeling are gone—the pass, the rebate, unjust discrimination. The railway men have learned much in the last fifteen years, as well as the commissioners and the people. Now the things which cause irritation are mostly lack of facilities and failure to provide promptly more modern and superior facilities, all of which cost money, often without return, and that money the railroad man has hard work to get. It will be still harder if you who elect your public servants do not investigate and tell them that while you would like very cheap transportation you do not want a price put so low that you have not enough transportation and what you do have is of a poor quality."

In a more pessimistic vein, Colonel James Hamilton Lewis, candidate for United States Senator from Illinois, discussed the problem of corporation regulation before the Chicago Traffic Club. Colonel Lewis claimed that under the designation of agents there are "46,000 individuals who serve as spies, watchers, decoys, betrayers, silent accusers, and secret slanderers of everything which pertains to the citizen of America. In a free government, by permission of things called law and regulation, these individuals like imps surround the cup from which the citizen drinks, shadow the table at which he eats, darken the threshold over which he lives, and sit like a thing of evil over every department of his undertaking." Colonel Lewis claims that $5,000,000 a year was spent by the Government in various departments of espionage and investigation. And he concluded with this forcible utterance:

"There is no man engaged in any large undertaking who can escape the Government presumption that he is dishonest and his business a fraud. No small business man can aspire to equality of competition except as the Government shall permit him to do so. This is allowed only under the prescribed restraint of the citizen's ambition and the governmental limitation on his capacity.

"Big business stands in fear, little business in despair.

"Business men tremble in terror of the uncertainty of the national law, and business in the different States is clutched with national regulation paralysis."

On the other hand, the advocates of regulation are by no means silenced. Concerning the railroad transportation problem, for example, Governor Herbert S. Hadley, speaking before the New Haven Chamber of Commerce, said: "The people have a right to insist that the (railroad) charges be so fixed as to yield only a reasonable rate on the value of the investment, and that the funds derived from railroad operation should not be used for the purpose of stock speculation, or the purchase of controlling interests in competing lines."

We may remark, in passing comment upon this deliverance of a Missouri statesman, that there are no cases on record in recent years where the profits from railroad operation have been used for either of the purposes which Governor Hadley so roundly condemns. The last great speculative deal in American railway history was the Alton reorganization in 1899, and the last great consolidation which arose out of a speculative situation was the purchase by the Atlantic Coast Line of the controlling interest in the stock of the Louisville and Nashville in 1902.

Digitized by Google

GOVERNOR H. S. HADLEY, OF MISSOURI.

Attorney General Wickersham is also an ardent advocate of stringent measures designed to control corporate activities. Speaking on "Equal Opportunities" at the Merchants and Manufacturers banquet in Baltimore, he said, "After all, the underlying philosophy of the so-called economic legislation of which the Sherman anti-trust law is a conspicuous example, is very simple. It is merely to prevent a particular group of people from compelling others by force, violence, fraud, or unfair means, from exercising their rights as free men, to pursue their vocation in such lawful manner as they think best. It is in recognition of these principles that Congress has enacted, and the national administration has sought to enforce, the laws against illegal discrimination and transportation, and undue restraints on trade. The effort has been to save the initiative energy and enterprise of the country from the deadening influence of governmental conduct of private business. If this prove ineffective, control of business by national commission will be inevitable, with control of prices of staple commodities, since price control is the aim of monopoly and the concern of the public."

Going much deeper than the superficial facts of everyday observation, Mr. Walker D. Hines, of New York, chairman of the Executive Committee, and general counsel of the Atchison, Topeka and Santa Fe, in the annual address which he delivered before the Kansas Bar Association at Topeka, contrasted favorably with what he termed the "general inefficiency" of our government, characterized, as it is, in nearly all departments by a lack of definite individual responsibility, the regulation of the railroads. This, he said, "is the most rigid and effective regulation we have in this country, and we find that in that matter the States have had to depart very widely from the principle applied to governmental matters in general. This is true because the railroads are regulated through commissions which are small enough to avoid widely scattered responsibility which combine executive functions with functions which are practically legislative, and which have a central responsibility for the enforcement of the law throughout the State. The ordinary methods of State government would never have succeeded in regulating the railroads effectively, and those methods cannot be expected to succeed with respect to the numerous other complex subjects which must be successfully regulated in order to meet the legitimate requirements of the people."

In a survey of the present trend of business regulation, Mr. Charles M. Schwab, president of the Bethlehem Steel Company, speaking at the annual dinner of the Engineers' Society of Western Engineers at Pittsburgh, sounded a conservative note of optimism. "It is my true belief," he said, "that however bad, no legislation nor agitation will stand that will strike off the fundamental roots of economical manufacture. Many of you engineers and manufacturers thought that when the Interstate Commerce Commission was formed business in the country would be ruined; but you have found otherwise. So it is with other business and manufacturing agitation." This conclusion is one to which every intelligent and observant citizen can heartily subscribe. Nothing con stop the steady development of American business. In so far as the numerous regulations, restrictions and ordinances which have been imposed for its guidance upon the business man for his direction and guidance, conform to the permanent development of American industry, they will stand and be incorporated into the habits of thought of the American people. In so far, however, as these regulations are impediments to the stream of progress, it will first flow around them, and then entirely submerge them.

Digitized by Google

There can be no doubt that out of the anti-corporation movement of the last decade, harmful to honest business men and legitimate business interests as this agitation has often been, has arisen a new corporate conscience and a recognition on the part of men of large affairs that they are in the fullest sense trustees for the welfare of the American people, charged with the duty of administering their great enterprises not alone with a view to private profit but with the primary object of furthering the public welfare.

TO ARBITRATE FIREMEN'S WAGE CONTROVERSY

After several weeks of discussion, accompanied by the usual display of force and menace of a general strike, the Conference Committee of Railway Managers, representing fifty-four Eastern roads, on February 18th, agreed to the demands of the Brotherhood of Locomotive Firemen and Enginemen, that the dispute over wages be arbitrated by a board of three arbitrators under the Erdman Act. The railroads strongly objected to the method of arbitration insisted upon by the firemen, and in a letter sent by Elisha Lee, chairman of the Conference Committee of Managers, addressed to Judge Martin A. Knapp, of the United States Commerce Court, and acting Commissioner of Labor G. W. W. Hargar, through whose efforts the parties have been brought together, they state their objection as follows:

W. W. ATTERBURY.

Vice-President of the Pennsylvania Railroad, who has been appointed to represent the Eastern carriers in the arbitration of the Firemen's Wage Controversy under the Erdman Act.

"The responsibility which ultimately would rest upon a third member of an Erdman arbitration board was too great to impose on any one man. The operation of the Act is to settle a dispute rather than to adjudicate a controversy.

"The arbitrators are three in number. Each side is represented by one arbitrator. It rests, therefore, upon the third arbitrator to bring the other two arbitrators as nearly as possible together, and if he cannot do so he must decide between them. This is accomplished by splitting differences, and the case may be adjusted without adequate investigation of the facts involved, and the award may not rest upon a basis of equity.

"But the most fundamental defect of the Erdman Act is that the interests of the public are not guarded by it.

"The managers feel that the public will not tolerate a strike, and realizing their threefold responsibility to the public, their men and their shareholders, they only agreed to arbitration under the Erdman Act when it seemed the only way to avert the calamity of a strike. The Firemen's Brotherhood has no responsibility except to its members."

The proposition of the railroads was that the controversy should be arbitrated by a board similar in composition to that which settled the difficulties with the engineers. The Conference Committee thought there should be an increase in the wages of firemen. The only difference between the parties concerned was the amount of the increase. This difference, it was proposed to leave to an impartial board. The board, as constituted under the Erdman Act, cannot be impartial. It is a decision of a question of immense public importance, practically by a single man. This decision must be announced within thirty days, a time altogether too short for investigation of the numerous and complicated questions involved, and finally, as Mr. Lee points out, arbitration of this character always results in a compromise. The umpire will naturally refuse to accept the responsibility of deciding unqualifiedly, in favor of either side. The result will be a substantial gain for the firemen. This process can be resorted to indefinitely and there is no end short of the limits imposed by insolvency, to which organized labor is not apparently determined to go in its efforts to increase wages. The machinery established by the Erdman Act is admirably calculated to secure for them, on the occasion of each demand, the substantial portion of what they asked for, and they have only to make their demands large enough to gain everything that they really want.

Organized labor in the railway field is "holding up" the railroads and through the railroads, the public, to pay them higher wages under the threat of inflicting num-

Digitized by Google

erous damages upon the business interests of the country by means of a strike. The strike vote is the invariable threat of these negotiations. The representatives of the various brotherhoods, when they come into conference with the Conference Committee of Railway Managers, flaunt the threat of a general tie-up of the railroads, in case their demands are not granted. If it were a question of considering the admittedly excessive demands of the firemen *in toto* or precipitating a strike, the Conference Committee probably would not have assisted, since without the support of public opinion, (and it is inconceivable that the firemen could have gained this support under the assumed conditions) the strike would have been a failure. The men are, however, offered a form of arbitration, and poor and inadequate as this form may be, it was a wise and public-spirited act on the part of the railroads to accept it, in the hope that the public will soon take the same position toward this method of settling dispute, as they now assume toward the method of a strike. As Chairman Lee said:

"The question the public should seriously consider is whether, in compelling the railroads to arbitrate under a defective and inadequate law and in this securing temporary convenience and accommodation, they are not sacrificing their permanent welfare.

"The Managers' Committee wishes to warn the public at this time of another and similar demand for increased wages made by the conductors and trainmen. We desire to put the public on notice as to the crisis that will confront them when these demands are considered by the railroads.

"We also desire to call attention to the serious public danger of these recurring demands, backed up by repeated demands that the railroads arbitrate 'under the law.'

"The whole situation is now in the hands of the Government and the people. They have taken it out of the hands of the managers at a time when the latter hoped to make a stand for the public good."

The public will await with interest the result of the findings of this arbitration committee. For the first time, the attempt has been tried to arbitrate a large controversy under the Erdman Act. As for the railroad managers, they are convinced that the result of the experiment will show the imperative necessity for providing some permanent method of settling these disputes which should especially concern the public welfare.

FRANK HITCHCOCK,
Postmaster-General.

MEASURING THE EFFECT OF THE PARCEL POST

Railway men and express company officials are observing with keen interest the development of the Government's experiment with the Parcel post. The annual report of Postmaster General Hitchcock contains certain important suggestions looking to the extension of the system. The Postmaster General intimates that a considerable reduction may be made in certain of the rates, and furthermore, which is of the most serious moment, that the eleven pound limit on the weight of parcels mailed should be regarded as "merely tentative." "After the system is thoroughly organized on that basis," he says, "the scope of the service in its usefulness to the public should be still further enlarged by increasing the weight limit." In connection with the establishment of the parcel post, the Postmaster General recommends that legislation be enacted looking to the readjustment of the payments to the railroads for the transportation of mails. "Many of the roads," he says, "will be entitled to increased compensation," and he renews his recommendation that payments to the railroads carrying the mails shall be made on a car-space basis, and upon a basis of the cost to the roads of the mail transportation.

While the loss to the railroads from the extension of the parcel post is conceded, it is not equally certain that the express companies have seriously suffered. One of the

Digitized by Google

large express companies, which has been keeping a close watch on its business and receipts from different classes of service, finds that on parcels under eleven pounds into which parcel post competition enters, it has sustained a gross loss of 25 per cent since January 1st. On the other hand, the increase in packages over eleven pounds has been sufficient to result in a fair gain in revenues over January, 1912.

That the new system has been a success on the basis of the volume of business handled, is seen from the statement authorized by the Postmaster General that 40,000,000 packages have been handled during the first month, and that the volume of traffic had been so greatly increased that $750,000 was needed at once to meet the new conditions. A large expenditure will be needed, among other things, to provide additional space for handling the new business.

While the express companies are not indifferent to the possibilities of loss resulting from the introduction of Government competition into their business, they are, nevertheless confident that even for the immediate future, they can hold their own. In this connection it is pointed out that only 40 per cent of their profits comes from the business of transportation, the balance is derived from income on investments and from service, such as the transportation of money, and the sale of domestic and foreign exchange which they perform.

The total business to be handled by mail and express is rapidly increasing, and it is fair to assume that it will increase the more rapidly because of the efforts which both the Government and private agencies, interested in the extension of the parcel post, will make to educate the rural population in the advantages of extending their direct relations with the consumer. While the result of this campaign of education will undoubtedly be to increase the business of the Postoffice Department, it is equally certain that the express companies will gain largely in the shipment of heavier packages. The situation is analogous to that presented twenty years ago by the rapid development of the electric railway as the competitor of the steam lines. At that time, it was freely predicted that the railroads would suffer so severely that they would have to abandon their short distance passenger traffic. So far from this having been the result, however, it is now recognized by passenger officials that the rapid extension of the interurban electric railway, because it has at the same time stimulated the habit of travel, and also brought a large population into direct contact with the steam lines, has been responsible for a considerable portion of the large increase in passenger business which the railroads have enjoyed in recent years. There is no reason to doubt that the extension of the parcel post will have a similar effect upon the business of the express companies.

CONFLICTING VIEWS ON THE "SHIPPING TRUST"

As a result of the testimony which has been taken by the House Shipping Trust Investigating Committee, it is clearly evident that any attempt to break up the methods which are now in vogue will be to inflict serious damage upon the shipper. Two features under which the present system is conducted, which the testimony has revealed, have been the existence of "pools, rings and conferences among the shipping companies and the rebates and discounts to shippers."

The shipping conference is the application of the co-operative principle to the business of ocean transportation by arrangement between the members of the Conference. The individual owners place their boats in the United States service, covering the regular ports on schedule time and giving the shipper regular and continuous sailings on which he can depend. Excess tonnage is kept in reserve and diverted to those ports where it is needed. The result is a regular supply of transportation service and reasonable and stable rates which can be counted upon and corporated in business plans instead of the extraordinary fluctuations, ranging from an unprofitable rate to the shipping company to a prohibitive rate to the shipper, which were formerly in vogue.

These agreements demand for their successful working, some such guarantee as is secured by pooling their earnings, and a necessary feature of it is also the system of discounts and rebates to shippers who patronize the line. The public does not realize that the business of ocean transportation is conducted under conditions fundamentally different from those which surround the railroads. On land each railroad owns its own land; competitors can come upon its rails only by agreement and by paying for the privilege. The ocean routes, however, are free to all without charge. If a tramp steamer calls at a port which is served by regular lines of steamers and in order to in-

Digitized by Google

crease its profit on the entire round trip voyage, offers transportation at a cut rate only justified by the fact of an empty hold on a return voyage, the inducement is sure to attract some exporter, anxious to gain an advantage over his competitor. By taking the space in the tramp steamer he gains a temporary advantage over these competitors, and to that extent, inflicts damage upon them.

The regular line is now called upon by its patrons to protect them against this competition. Two methods are open to furnish this protection: first, to meet the cut rates, which means that the regular line must do business at a loss, and second, offer some substantial inducement to its patrons to use its line to the exclusion of the tramp steamer which is in no position to give them regular service. The working of this inducement was explained by Mr. Lorenzo Daniels, of the firm of Busk and Daniels, general agents of the Lamport and Holt Line, in an interview in the New York *Journal of Commerce,* as follows:

"In other words, the idea of the discount or contract between the shipper and the regular line is one of continuous service on the one part and continuous support on the other; and, unless this agreement takes substantial form in the shape of a five per cent or ten per cent cash discount, human nature is such that there is always some merchant willing to sacrifice broad principles for the present opportunity of beating out some of his rivals. The larger merchants, the trade as a whole, and every merchant that is conscientious will admit that on broad lines regularity of service and stability of rates, provided always, of course, that there is no unreasonableness or excessive charge, are the backbone and structure on which healthy, progressive commerce is developed; and the discount, commission or bonus system is the outward or visible sign, so to speak, that causes the selfish man who would beat his rivals out to stop and think whether it is worth while; and he generally discovers that his little discount coming from the regular lines more than counterbalance any value the bargain or bargains that he may be offered during the year. In other words, the discount or rebate system is a 'quid pro quo' that the regular line can afford to pay to secure stability in the steady flow of traffic and rates and is an equivalent that pays the merchant at the end of the year a better value than occasional bargains, in addition to the fact that it enables the transportation service in the trade to be steady, regular and efficient.

"I might further add indirectly that one merchant putting through a business transaction at a cut rate, based, we will say, on picking up a bargain that did not pay the owner on its own merits, disorganizes and entails a loss on ten other transactions of equal magnitude that the regular merchants in the trade must bear."

That the result of the investigation will be some extension of Government control over the ocean transportation business seems certain. Such a control, however, must recognize, just as the Interstate Commerce Commission recognizes, that agreements of some nature are necessary to insure stability of rates, and furthermore, that the peculiar conditions under which ocean commerce is conducted imperatively demand the continuation of those special arrangements which have done so much to bring regularity and order into a business, where before their introduction all was confusion, uncertainty and disorder.

PANAMA CANAL DEVELOPMENTS

In sharp contrast with the declaration of Senator Root in his noteworthy speech in the Senate, that the United States Government was wrong in granting free passage through the Panama Canal to coastwise commerce unless the same concession was made to foreign ships, is the reply of Sec-

IRVING T. BUSH, President of the Bush Terminal Company, who discusses the probable future influence of the Panama Canal.

U. S. SENATOR ROOT, of New York, who opposes the granting of free passage through the Panama Canal to coastwise vessels.

SEC'Y. OF STATE KNOX, whose able reply to England in the Panama Canal controversy has caused nation-wide interest.

COL. G. W. GOETHALS, whose recent visit to the United States developed into a series of ovations and receptions.

Digitized by Google

retary Knox to the British protest against this exemption. This reply takes issue with the claim on which Senator Root's argument was based, namely, that the exemption of domestic commerce from tolls through the canal will result in an increase in those tolls to be paid by foreign ships. Without admitting that the burden of proof rests upon the United States to show that the entire traffic passing through the canal has not been reckoned with in fixing upon the tolls and that consequently they are equitable, Secretary Knox informs the British Government that such is the case, and that in adopting the rate of $1.25 per ton, Prof. Emery R. Johnson included American coastwise shipping in his calculation. The exemption of the coastwise traffic from the canal tolls is, therefore, a form of subsidy. Nearly all nations subsidize shipping directly. This is an indirect form of subsidy which will cost Great Britain nothing, since it does not help any vessels competing with British boats, because all foreign vessels are excluded from coastwise trade. It is by no means certain that Sir Edward Grey would have made such a strong protest, had he known of this point made by the American Secretary of State, before he wrote his communication.

Secretary Knox has an alternative to the immediate exchange of ratification of the as yet unratified Knox-Bryce general arbitration treaty, which President Taft has so far declined to consummate because it limits the power of the special commission provided for in the treaty, to mere investigation and report, refusing to permit the Commission to bind either country. It consists of a commission to be created for the special purpose of ascertaining the facts in reference to the effect upon British shipping of the Panama Canal toll act and the present proclamation fixing the toll.

Of greater interest than this exchange of diplomatic opinion, is the effect of the Panama Canal upon American commerce. Mr. Irving T. Bush, president of the Bush Terminal Company, in a communication to *Financial America*, calls attention to the danger that New York may fail to gain the expected increase in commerce because of lack of preparation for additional business which may come to that port because of the opening of the canal. Mr. Bush is of the opinion that when the canal is first opened there will be but little change in the commercial importance of the different American seaports.

After the canal is in full operation, however, he sees a gradual rearrangement of the terminal ports, based upon operating costs. The North Atlantic ports will stand or fall together in their gains or losses in the opening of the canal. They are all threatened, however, according to Mr. Bush, by the competition from New Orleans which is more than 1,000 miles nearer the mouth of the Panama Canal than is New York, and which will have a marked geographical advantage as a port of entry for the distribution of merchandise brought from the Orient throughout the Mississippi Valley. The present ocean commerce from the East comes mainly through the Suez Canal to New York, and the opening of the canal may have the effect of diverting most of this commerce to New Orleans.

As for the Pacific Coast, so far from subscribing to the opinion that one of the effects of the opening of the canal will be to stimulate the locating of manufacturing industries in that section, Mr. Bush is of the opinion that the first effect will be to retard Western manufacturing, because it will reduce the transportation cost of Eastern manufactured products to the West coast.

The importance of properly defending the canal continues to engage attention. The canal was primarily designed as a means of strengthening the naval position of the United States, and its fortification is engaging the constant attention of the War and Navy Departments. The sites of the coast artillery fortifications have already been decided upon and the work upon the forts has already begun. A force of about 8,000 soldiers will be sent to the Isthmus as soon as the fortifications are completed.

Speaking before the House Naval Committee, Colonel Goethals, in charge of constructing the canal, assumed as settled that no foreign fleet would run the risk of engaging the land battery in making a demonstration against the canal. Their efforts would be to first defeat the naval force and then to land troops to attempt to capture or destroy the locks. He did not believe that 8,000 men would be sufficient for the defense of the canal, but admitted that this is about the proportion of our present military force which could be spared. With 25,000 men Colonel Goethals said the canal could be held against a siege. Of the 8,000 men sent to the canal, 2,200 would man the coast defenses and the remaining 5,800 would consist of infantry, cavalry and field artillery available for the defense of the locks. This force will be sufficient to protect the canal against a landing force of not to exceed 6,000 men.

HENRY P. DAVISON,
of J. P. Morgan & Company.

END OF THE "MONEY TRUST" INVESTIGATION

The Money Trust inquiry, for the present at least, has come to an end. The most notable testimony in the closing sessions of the Committee was undoubtedly that of Henry P. Davison, of J. P. Morgan and Company. Mr. Davison was extremely frank and outspoken in his defense of the existing financial order. The question of further concentration, he said, depended entirely on the business of the country. He declared that he favored "combination and control of industries under Government regulation as opposed to free, unrestricted competition."

"Do you believe," said Mr. Untermeyer, "three or four or half a dozen men should be allowed to monopolize any industry so long as they do not operate through a holding company?"

"I don't know how you could prevent it, if they had the financial backing and the ability to do it," asserted Mr. Davison. "I have no objection to it. If it was wrong it couldn't live. I see no necessity for a law to prevent it. It would fall of itself in the making."

"Are you opposed to trusts?" asked Mr. Untermeyer.

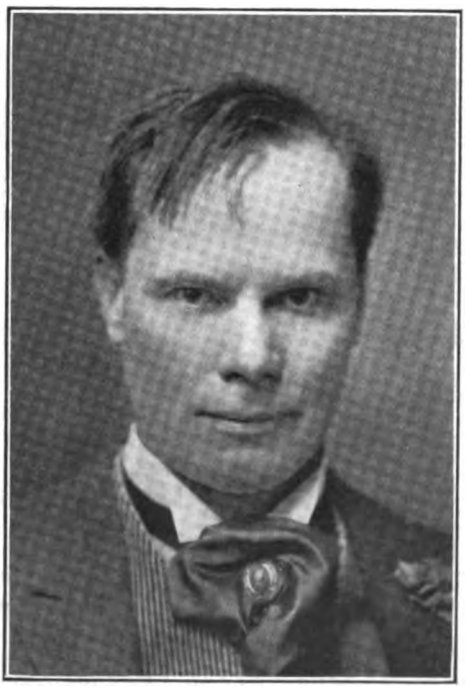
"I would not say that I was wholly in favor of them in the making, but I was not opposed to them after they were made. I think they were a great blessing to the country."

Mr. Davison further said that he thought it was "unfortunate for the people of the entire world" that the courts interfered with the trusts "as they have done."

"Do you think it was wrong for the courts to interfere?" Mr. Untermeyer asked.

"No," he replied, "but I think it could have been approached better from the other direction, by regulation, not disintegration. You cannot any more dissolve those trusts, in effect, than you can move this continent across the Atlantic Ocean."

There is a conviction among those who have closely followed the inquiry, that it will not be resumed by the House of Representatives or any of the committees. The only fact brought out by the investigation has been the concentration of financial power. This was well known long before the Pujo Committee was thought of. Indeed, the same facts which were elicited from the various witnesses by Mr. Untermeyer, were brought out by Senator LaFollette in a speech in the Senate five years ago. There is hardly a new fact which has been brought out by the investigation, which is one of the most expensive ever conducted. The recommendations for new legislation, which the committee submitted to Congress on February 28, will be discussed in the March issue.



GOVERNOR WILLIAM SULZER,
of New York.

Digitized by Google

GOVERNOR FOSS, of Massachusetts.

GOVERNOR BALDWIN, of Connecticut.

GOVERNOR POTHIER, of Rhode Island.

Three of the New England Governors who recently attended the meeting called by Governor Foss, of Massachusetts, to consider the New England transportation situation.

Active efforts in the direction of financial reform have shifted from Washington to Albany. Governor William Sulzer, in a special message to the State Legislature, dealt with the subject of remedial legislation regarding stock exchanges. Although recognizing the necessity of the exchange he claimed that, as present constituted, they contained serious evils demanding immediate remedy. These evils, briefly summarized, are manipulation,—including short selling, more stringent rules preventing the "bucketing" of customers' orders, legislation prohibiting brokers from doing business after their known insolvency, prohibition on the issuing of false statements, and discrimination against other exchanges. On the basis of these recommendations ten bills have been introduced into the Legislature which are, in substance, and in the order of their introduction, as follows:

First. Establishment of a maximum rate of 15 per cent for call loans.

Second. Making it a felony to purchase or sell stock in which there is actually no change of ownership.

Third. Making it a felony to issue or publish any false statements of any facts affecting the price of stock.

Fourth. Making it a felony to inflate or depress the price of stock by means of fictitious purchases, sales or other transactions, or to conspire for such purposes.

Fifth. Prohibiting a broker from purchasing or selling stock and trading in them against his customers' orders.

The object of this measure is to prevent a broker from taking advantage of the confidential relations with his customer for his own profit.

The sixth measure makes it a felony for the broker to receive from a customer, ignorant of the broker's insolvency, moneys or securities except in liquidation of a debt due to the broker, if the customer loses as a result of such transaction.

The object of the seventh measure is to more effectively enforce the law against "bucket shops" by providing that a witness shall not be excused from testifying on the ground that his testimony may tend to convict him of a crime, with the proviso that he shall not be prosecuted for any incriminating matter or thing concerning which he may testify.

Eighth. A bill providing for the incorporation of exchanges.

Ninth. To prevent a broker from "shading" in any way an order of a customer.

Tenth. A bill which will prevent discrimination against other exchanges, particularly the Consolidated Stock Exchange of New York.

THE NEW ENGLAND GOVERNORS AND THE RAILROADS

The meeting of the New England governors called by Governor Foss of Massachusetts, to consider the transportation situation, was attended by every governor except Haines of Maine, who excused himself on account of illness. In the letter calling the meeting, Governor Foss indicated that the substance of the resolution

Digitized by Google

which he would offer looked toward the establishment of a railroad commission for the whole New England, to be called the New England Transportation Commission. The letter concluded:

"My idea is that the scope of the work of this New England Transportation Commission should be broad. The Commission should call upon the railroads to provide such facilities for the service of New England as they may decide to be requisite; they should also determine whether New England rates are upon a proper basis and use their influence to make the rates in and out of New England favorable to the development of this region.

"It may be said that the orders of this Commission cannot be given the force of law; but this Commission would prove to be a formidable board to deal with. No corporation would dare to disregard instructions from a body made up of the executive heads of the State commissions, and the recommendations of such a board ought to insure identical legislation in the various legislatures. It would have behind its decisions the virtual authority of the six commissions, to say nothing of the united opinion of the six States.

"I am inclined to believe that we must insist upon having a voice in the management by the appointment of a certain number of directors, in order to feel secure of our future. Directors appointed by the States would have authority in determining the policies of railroads which could be obtained in no other way, and they would have also opportunities for inquiring into transactions and opposing their consummation at an earlier stage than any regulating body could take action. With both a share in the management of the company by State directors and a control of that management by a special commission, I think that we could face the future with confidence that we had full control of our destinies."

While little has been made known concerning the results of the conference, it is supposed that an agreement was reached to put into effect some plan of co-operative action along the lines suggested.

It is plain, moreover, that the people of New England are recovering from the acute attack of hysteria which recently afflicted them, and are taking a saner view of the situation presented by the abandonment of the Grand Trunk extension project. In the answers of Presidents Charles S. Mellen and Edson J. Chamberlain to indictments charging violation of the Sherman Act, the following reasons were advanced for the appointment of a commission to go to London and take testimony of all the directors of the Grand Trunk Railway who reside there. The enumeration tends to show that current explanations of the abandonment of the Providence and Boston extensions of the Grand Trnnk are incorrect:

"(1) That the suspension work on the Palmer-Providence branch was ordered from London in November last, on orders from Alfred W. Smithers, chairman of the board of directors, as a result of a resolution adopted by the directors, because of the impossibility of obtaining money in London, where the Grand Trunk and all its projects have always been financed.

"(2) That the cause of the inability of the Grand Trunk to get money was due to the financial stringency and state of semi-panic resulting from the Balkan war, and the panic conditions prevailing on the Continent.

"(3) That there was no cause for the suspension of the Palmer-Providence project except the conditions resulting from the Balkan War, and the inability of the Grand Trunk to get money.

"(4) That at the same time as the suspension of work on the Palmer-Providence extension, orders were received from London to suspend work throughout the Grand Trunk system, and at that time the Grand Trunk had immediate commitments for improvements in various parts of the system outside New England aggregating $30,000.

"(5) That the spending of money on all these improvements was stopped at the same time and for the same reason.

"(6) That the board of directors did not intend to abandon work on the Palmer-Providence extension, but expected that it would be resumed as soon as the financial conditions made it possible.

"(7) That the provisional New Hampshire Corporation, the formation of which was alleged to have been contemplated by the Grand Trunk Railway Company, to construct a line from White River Junction to Boston, was never considered by the Grand Trunk directors, and that if any act was done by the late President Hayes, looking to the organization of such a corporation, it was done without authority from the board of directors and not ratified by them."

It is well known that the difficulty of obtaining money was the primary reason for the abandonment of construction work. Of the two extensions proposed, the one at Boston is unlikely to be resumed because of the immense cost and doubtful returns of this project. The extension of the Central Vermont to Providence is viewed with favor in London, since this branch, traversing the rich manufacturing district of Southern New England, would bring a great deal of traffic to the Grand Trunk, and Grand Trunk officials claim that as soon as the financial situation improves, construction work on this extension will again be actively prosecuted.

THE INFLUENCE OF THE STEEL TRUST

The first important gain made by the Government in its suit for the dissolution of the United States Steel Corporation was secured in the testimony of former President W. E. Corey of the United States Steel Corporation. Mr. Corey testified to the existence of the steel rail pool among

Digitized by Google

E. H. GARY,
President of the United States Steel Corporation.

CONGRESSMAN A. O. STANLEY,
of Kentucky.

Congressman Stanley is the author of the bill designed to deny the right of ownership of railroads to industrial corporations.

American manufacturers as late as 1904, at which prices of rails were kept on an even keel and business was divided. As late as 1910, an understanding had existed with foreign steel manufacturers under which the United States Steel Corporation agreed not to compete with them in their own countries, and foreign manufacturers, in turn, agreed not to seek business in the United States. It was understood, he said, that competition could be restricted through neutral markets to countries which did not produce steel rails. He also testified that a similar international agreement divided up the business of neutral markets in armor plate. Interesting testimony for the purpose of the Government's record, related to the purpose of the famous Gary dinners:

"Following the first Gary dinner were sub-committees appointed?" asked Mr. Dickinson.

"Yes. They were supposed to represent various branches of the steel industry," replied Mr. Corey.

"State whether or not it was the purpose of these sub-committees to reach a general understanding as to steel prices and to bring about the maintenance of them."

"Yes, it was."

"Did it bring about the maintenance of prices?"

"For a temporary period only."

Asked whether prior to the open market of February, 1909, he and the other officers of the company were in favor of meeting market conditions and cutting prices, Mr. Corey said: "Personally I was."

"Did your views prevail?" asked the Government attorney.

"Prices were maintained for a longer period than I thought was advisable," responded the witness. It was with considerable reluctance that Mr. Corey admitted that "prices were maintained as a result of understandings" reached by members of the sub-committee.

Mr. Corey further testified that the Tennessee Coal and Iron Company was, before its absorption by the United States Steel Corporation in 1907, a competitor with the Steel Corporation in steel rails in the South and Southwest.

Although the officers and directors of the United States Steel Corporation will not concede the possibility of dissolution, standing by their declaration made at the time the Government suit was begun, that the corporation was organized for lawful purposes and has been conducted in a lawful manner, the general opinion in the steel trade inclines toward the belief that the Supreme Court will eventually order a disintegration of the corporation. The Union Pacific-Southern Pacific decision has foreshadowed such a result. That there has been a restriction of competition among the constituent companies of the United States Steel Corporation is not to be doubted, and this, of itself, in the light of the recent railroad decision, seems to be sufficient ground to anticipate a dissolution order. It is known, moreover, that some of the United States Steel Corporation directors have gone so far as to anticipate at least a segregation of the transportation properties from the manufacturing interests of the company.

In this connection the bill introduced by Representative A. O. Stanley, of Kentucky, in the House of Representatives, designed to deny the right of ownership of railroads to an industrial corporation is of interest. Speaking in advocacy of his bill before a House committee, Mr. Stanley said:

"The commodities clause of the interstate commerce law is a joke and a sham; it is open at both ends; it is not worth the paper it is written on.

"What use is there in saying that railroads shall not own coal mines or manufacturing concerns and then letting the mining companies or the manufacturing concerns own the railroads?" he demanded.

Mr. Stanley declared the Interstate Commerce Commission was powerless to prevent rebates from the railroads to the United States Steel Corporation. Members of the committee questioned the statement and asked if the Elkins law did not give full authority to prevent rebating. Mr. Stanley said it did not prevent the devices used by the Steel Corporation, through terminal charges and the like, whereby it made immense profits out of what amounted to railroad rebates. He declared that his bill was designed to back up the commodities clause.

HARRIMAN LINES DISSOLUTION PLAN APPROVED

The dissolution plan for carrying into effect the orders of the Supreme Court, in reference to the separation of the Union from the Southern Pacific, as set forth in an official statement, is as follows:

"The boards of directors of the Union Pacific Railroad Company and Southern Pacific Company at meetings held to-day approved plans which have been under consideration by special committees for several weeks and which have been worked out with the Attorney General, subject to the approval of the Court, as follows:

"The purchase by the Union Pacific of the entire capital stock of the Central Pacific, consisting of $67,275,500 par value of common and $17,400,000 par value preferred for the sum of $104,189,941—the cost at which it stands upon the books of the Southern Pacific Company; $84,675,500 of this amount was to have been paid in stock of the Southern Pacific Company held by Union Pacific at par, but legal difficulties having been found in the way, the plan has been changed so that payment is to be made as follows, viz.:

"The $126,650,000 par value, being the entire amount of stock of Southern Pacific Company held by the Union Pacific (the entire outstanding issue being $272,672,405—Ed.) is to be offered to the stockholders, common and preferred, of the Union Pacific and stockholders of the Southern Pacific Company other than the Union Pacific and Oregon Short Line, for subscription at 98⅝ per cent and accrued dividend. This offer is to be underwritten and subscribers are to receive the dividend payable April 1, 1913.

"The proceeds of $84,675,500 of this stock less the underwriting commission and expenses is to be paid over to Southern Pacific Company, together with $5,449,000 of the Southern Pacific Company's 4 per cent gold bonds and $14,065,441 in cash.

"The Attorney General of the United States has assented to the essential features of this plan, but it is of course subject to the approval of the District Court in which the Government litigation is pending and also dependent upon the approval by the California Railroad Commission of agreements for certain trackage and running rights in that State. The plan and agreements will be presented to the Court and Commission with the least possible delay."

The $126,650,000 of Southern Pacific stock offered for sale to the stockholders of the two companies, will be underwritten by a syndicate headed by Kuhn, Loeb and Company. The ratio of subscription of the Southern Pacific stock is one share for every four shares of Union common or Union preferred held, and one share for every three shares of Southern. The object of this preference to Southern Pacific stockholders is to further conform to the spirit of the Court's decree to lessen the influence of Union Pacific stockholders in Southern Pacific affairs. It is also a feature of the reorganization plan, that the Union Pacific leased to the Southern Pacific a portion of the Central Pacific line, running from San Francisco northerly to Tehana in Northern California. The Union Pacific has a line paralleling this branch. The plan is not only fair to the stockholders of both companies, but it protects various bondholders of the Union Pacific and its subsidiaries. Of the $126,500,000 Southern Pacific stock, $108,000,000 is deposited as a part of the security for the Oregon Short Line refunding 4's. Of these bonds, however, the Union Pacific has $55,000,000 in its treasury and can secure the release of about $65,000,000 of the pledged Southern Pacific stock by cancelling these bonds. The remainder of the Southern Pacific stock will be released from the mortgage by the substitution of other collateral. The Union Pacific has unpledged in its treasury, $22,000,000 of Baltimore and Ohio stock, $4,000,000 of Chicago and North Western, $22,500,000 of Illinois Central, $9,850,000 of New York Central, and $1,845,000 of St. Paul preferred. The Central Pacific stock, which the Union Pacific is to purchase, is pledged to secure an issue of Southern Pacific bonds, of which $34,218,000 are outstanding. The Union Pacific own $5,449,000 of these bonds and will turn them over to the Southern Pacific in part payment for the Central Pacific stock. The remainder of the bonds will be left outstanding, since the earnings of the Southern Pacific are more than sufficient to pay the interest charges. Attorney General Wickersham issued a statement approving the plan, in the following words:

"The result of the whole transaction will be to create ideal competitive conditions between the Union Pacific and the Southern Pacific for transcontinental business between Eastern points and Portland and San Francisco and to relieve the States of California and Oregon of the monopoly of railroad control which has been the occasion of such widespread public dissatisfaction in the past. The Attorney General feels that the approval and the carrying out of this plan will accomplish results of inestimable benefit to the public, and results far more satisfactory than there was any reason to anticipate could have been secured."

While the financial results of the plan are generally considered to be promising from the standpoint of Union Pacific stockholders, there has been some fear lest the Southern Pacific might suffer. This phase of the dissolution is fully considered in our financial section.

PROF. E. R. JOHNSON, of the University of Pennsylvania.

J. T. JOHNSTON, President, The Traffic Club of Pittsburgh.

GEORGE A. POST, President, Railway Business Association.

ARTHUR BRISBANE, Editor-in-Chief of the Hearst Newspapers.

Four men prominently identified with the recent annual banquet of The Pittsburgh Traffic Club. Mr. Post was toastmaster, Professor Johnson spoke on Panama Canal Tolls, and Mr. Brisbane spoke on the Newspaper View of the Railroad.

ANNUAL BANQUET OF PITTSBURGH TRAFFIC CLUB

One of the most interesting meetings of the Pittsburgh Traffic Club, the organization which has been especially noteworthy for the value of its contributions to the discussion of subjects of interest to shippers and railroads, was the annual dinner held in the banquet hall of the Hotel Shenley on January 30th. The attendance was unusually large. The personnel of the visitors included presidents, traffic managers and high officials of the leading railroads of the country. Three special trains brought most of the out-of-town guests. The toastmaster was Mr. George A. Post, president of the Railway Business Association, who briefly developed the thought that the people, through the multiplication of the avenues and agencies of regulation, have taken complete control of the railroads, and that upon their shoulders must rest the responsibility of the kind and quality of the service which the railroads render. "The people," he said, "regardless of party affiliations, having recorded their will, and having overborne all opposition to subjecting the railroads to rigorous inspection of even minute details of operation, have no longer any misgivings about their power to compel the railroads to do whatever they want them to do." The only ground for solicitude concerning the transportation situation, he concluded, was not whether the people should be protected against the railroads, but whether the railroads should be allowed to earn sufficient revenue to equip themselves to perform the public service which they owe to the United States.

The two leading addresses of the evening were delivered by Prof. Emory R. Johnson, professor of transportation and commerce, of the University of Pennsylvania, special commissioner on Panama traffic and tolls, and Mr. Arthur Brisbane, editor in chief of the Hearst newspapers. Professor Johnson's argument in favor of the repeal of the toll exemption clause of the Panama Canal Act of August 24, 1912, proceeded along familiar lines. He said, in substance, that the exemption of coastwise traffic from the toll charges would be a subsidy to an industry which was already protected by the absolute exclusion of foreign competition, an industry, moreover, which is in an exceedingly flourishing condition. He pointed out that the Government would gain no benefit from the remission of these charges "since the relation of the coastwise steamship companies with each other will be so regulated in their conferences that their charges will tend to be what the traffic will bear, that is, what shippers will pay to have their goods transported by water instead of by rail." In another place, Professor Johnson further developed this thought in the following manner:

"Probably 99 out of every 100 shippers will pay the same rates whether there be tolls or not. Most of the intercoastal traffic will consist of general commodities and package freight handled by the established steamship lines. Bulk cargoes of lumber, coal, ore and heavy steel products will comprise a relatively small share of the total traffic. The rates charged by the several steamship lines will be the same. The charges will be regulated by agreements among the competing companies and will be fixed primarily with reference to what the traffic will bear and only secondarily, if at all, with reference to the cost of the service to the carriers. The several steamship lines will maintain relatively stable schedules of charges

Digitized by Google

which will ordinarily be adjusted with reference to the even more stable schedule of commodity and class rates maintained by the transcontinental railroads and their Eastern rail connections. If the regular steamship lines are required to pay Panama tolls, their payments to the Government will be a part of their operating expenses which will thus be increased by the amount of the tolls. If the steamship companies are exempted from the payment of tolls they will thereby receive a subsidy equal to the amount of the tolls not collected by the Government."

Professor Johnson's conclusion was that if we are to give the owners of American ships $20,000,000 during the next ten years, the funds would be better applied to building up lines to Hawaii, China, Japan and the Philippines, to Buenos Ayres and to Valparaiso. Subsidies granted to these lines would improve the position of the United States in foreign commerce, and would result in permanent benefit to our merchants and manufacturers.

Mr. Brisbane's subject was "The Newspaper View of the Railroads." His address was one of the most interesting, if not in all places, the most conclusive which was ever delivered on an occasion of this character. A necessarily inadequate summary of the many points which he made, follows. We give this at length because the speaker addresses each day an audience of 5,000,000 American citizens. The views which he expressed, on this occasion, are the views which the Hearst newspapers are expressing every day. Railroad men do not read the Hearst newspapers, and are, therefore, generally speaking, in ignorance of the doctrines concerning them and their business which are being daily hammered into the American people by Mr. Brisbane and his assistants.

Mr. Brisbane deprecated the disposition of so many so-called statesmen to "bleed" the railroads. He admitted that the greatest minds of to-day are employed in constructive enterprise, and many of them in the railroad industry. "Such men as Cassatt, and Harriman, and Hill are all benefactors of their country, and those benefactors are the greatest and, probably the ablest, men of to-day, not excepting the newspaper editors who criticise them." Mr. Brisbane, however, claimed for the newspapers the privilege of criticism, and further argued that criticism was of the greatest possible benefit to those criticised, since it enabled them to realize their weak places and to remedy their defects. "The biggest man wants the biggest criticism and it would be an extremely bad thing for the United States, and for the railroads, if there was no ability in the Department of Criticism. Don't think a newspaper unfair because it always seems to side against the railroads. When you hear the great lawyer, doesn't he seem to side with the railroad? We newspaper men are the people's lawyer, we are bound to take it for granted that they are right just as your lawyer is bound to take it for granted that you are right."

Passing from this dangerous ground, Mr. Brisbane took up the parcel post, the innovation which he has championed for twenty years, and concerning whose possibilities he expresses the most boundless confidence. "In ten years from now the parcel post business will be so much the most important part of your railroad work that it will engross absolutely the attention of your traffic managers. You have had occasion to complain of postoffice rates under some conditions, but when you come to take a solid car, loaded to capacity, and send it from Chicago to New York for $400, which would be the minimum, and it might be $700, which is the occasional price now, and when you have tens of thousands of such cars, when you have the whole world brought into communication, you will see a work, and a development, and a prosperity, and a spending of money, and an opening up on all sides, that is in very few men's minds to-day."

Mr. Brisbane did not agree with Professor Johnson and his views concerning the Panama Canal. "The railroads hurt themselves," he said, "if they try to stop coastwise ships from going through the canal free. What makes prosperity? Prosperity makes prosperity. The railroads of the country are prosperous because the general trend is towards prosperity. If you increase the possibility of communication between California and Connecticut, or if you make this nation a more closely united nation, if you give opportunity to the man who has his lumber in the Northwest, to put his lumber into the Eastern market, do you think you are going to suffer? Has any improvement in the world ever hurt anything that was honest? There are more sailing vessels on the ocean than there were before the steam vessels were invented. There are many more horses working in the United States than there were before the automobile and the trolley were brought into use."

Mr. Brisbane concluded with a summary of his views on Government ownership which are well known to those who have read his editorials. He does not believe

Digitized by Google

that immediate Government ownership of railroads is profitable or desirable, and his reason is of great interest. To take the management of our railway system away from the kind of men who now operate it, and give it to the kind of men who would operate it under our political system would, he claimed, be a calamity. In time, however, he believes the people will have so far developed in intelligence that they will entrust to men like Mr. Rockefeller and Mr. Harriman the conduct of great public enterprises. When the standard of efficiency in public service will not be political success, but intelligent performance of public duty, Mr. Brisbane believes, the people of the United States will be ready to own the railroads and they will purchase them from their private owners.

PHYSICAL VALUATION HEARING

Railroad officials have apparently reached the conclusion that physical valuation of their properties is sure to come at an early date, and they have shown no disposition to resist the passage of the pending physical valuation bill. In fact, Mr. Delano of the Wabash expressed satisfaction at the recent hearing on interstate commerce, that this valuation was to be made. "It will serve to allay the public idea that the railroads are over-valued," he sad. "We are interested chiefly in having a fair valuation made. The Government is going to spend from $2,500,000 to $3,000,000 to accomplish the work, and I think it will cost the railroads of the country about the same amount to furnish the information."

President Loree, of the Delaware and Hudson, objected to the bill because it turned over to the Interstate Commerce Commission the work of making the valuation, and said that a fairer method would be to create a commission of nine, of whom three should be taken from the Interstate Commerce Commission, three from the American Railway Association, and the others as follows: one army engineer, one representative of the Steam Engineering Bureau of the Navy Department, and one Civil Engineer to be designated by the American Society of Civil Engineers.

This suggestion, eminently practical and desirable though it is, and indicating a constitution of the valuation board which would inspire general confidence did not, as might be expected, meet with the approval of the Commission, some of whose members vigorously objected to the proposal. Another demand submitted on behalf of the railroads was that their representatives be permitted free access to reports made by experts conducting the investigation in order that they may be prepared to combat any inaccuracies shown.

State Railroad Ownership in Texas a Failure.

THE State of Texas is having a somewhat crushing experience in Government railroad ownership. Several years ago it constructed a railroad between Palestine and Rusk and also built a short line to give one of its plantations in South Texas a transportation outlet. The latter road has been sold to private interests at a heavy loss from its original cost. The other line, which is known as the State Railroad, has been a financial burden ever since its construction. In a message to the Legislature, Governor Colquitt recommends that the State dispose of the property. In discussing the subject he says:

"The State Railroad is still a Jonah and a heavy expense to the penitentiary management. It has been operated during the last two years at a loss of $50,000. There are $100,000 worth of bonds on it, held by the public school fund; they bear five per cent interest. According to the Railroad Commission, the road cost $577,899.63, and showed a depreciation of $68,828.12 at the time of its valuation. It still runs from Rush to Palestine."

Railway Mail Pay.

THE Rock Island *Employes' Magazine* for February sharply criticises the treatment of the railroads by the Government in the matter of pay for the transportation of mails and calls upon each man as a matter of loyalty to the company to protest to his Congressman and to the Senator from his State against existing conditions. The conditions complained of are as follows:

"1. To add the parcel post to the mails, compelling railroads to furnish transportation and postoffice facilities for it on trains without provision for compensation. The railroads lost also the revenue they got from the express and freight service prior to January 1 which the parcel post displaces.

"2. To require railroads to furnish apartment cars, with the necessary fittings, and provide light, heat, etc., for mail clerks, without compensation for the space they occupy. Railroads are paid for the weight of mail only.

"3. To weigh the mail only once every four years, requiring railroads to carry all increased weight during that four years for nothing. The Government collects postage on all its increase, amounting to millions of dollars. With the parcel post added to the ordinary mail, the four-year weighing and adjustments would be so palpably wrong that Congress should be willing to adjust the matter fairly by weighing the mails for a short average period each year, say 35 days."

Contemporary Opinion

James J. Hill on Railroads.

THE New York *Commercial* in an issue of recent date discusses an article by James J. Hill, appearing in the New York *Sun* on "The Outlook for American Railroads." Mr. Hill makes the statement that he considers the railroads to be on the brink of catastrophe and that it will take but little to topple them over on the one hand, or to restore their full usefulness on the other. He goes so far as to say that unless railway facilities and terminals are increased, the ever-growing congestion which often paralyzes traffic to-day, will result in an industrial chaos. The *Commercial* in commenting upon this statement says:

"This is a strong way to put it, many will think it exaggerated. But all the facts are such as to give a substantial backing to his vivid presentation: 'I can best compare the railroads to a bottle,' he says, 'increase the size of the bottle without enlarging the neck and more time and work are required to fill and empty it. That's what's the matter with railroads. The volume of the bottle has grown, while the neck has remained the same. The demand for transportation is growing apace with the growth of population and production. In the Pittsburgh district, for example, railroad tonnage grew from 64,000,000 to 152,000,000 in ten years between 1901 and 1911. This growth is characteristic of any large city.'

"He proceeds to say:

"'Now if a manufacturer were confronted with such conditions he would have to do one of two things—refuse business or double his plant. Railroads cannot refuse business. In the first place it is not legal to do so. In the second place it would mean national panic and individual rule. So the only course is for the railroads to enlarge their plants. This means spending millions of dollars. Even existing plants cannot be worked to their limit unless the size of our terminals is increased.'

"The tremendous cost increase of building, operating and maintenance without a proportionate increase in those rates, which after all, on American railways, have been and are the lowest in the world, has made it practically impossible to augment these revenues without which the parallel march in progress is impossible, competently for the great work they have to do. Without the ability to make this accord between expense and revenues, they cannot borrow money to build needed new mileage, nor can they maintain the old mileage on the proper basis. Mr. Hill clearly points out the imperative need that the Interstate Commerce Commission shall give them the opportunity, if investigation shows the alleged need existent, to raise, under the proper supervision, the rates both freight and passenger to a schedule basis, which shall equalize the situation. Men of business sense will justify such a concession. It is to their own interest that, the cause being definitely posited, the difficulty shall be removed."

The Question of Railway Credit.

THE *North American Review* in its February number publishes a most excellent article by Mr. Franklin Escher on "The Delicate Question of Railway Credit." Mr. Escher asserts that the present unwillingness on the part of investors to buy railway bonds is due to the attitude assumed by the Interstate Commerce Commission during the past two years, who, in spite of the heavy increase in railway operating expenses caused by the higher cost of material and labor, have assumed an uncompromising attitude towards an increase in transportation charges.

He points out, that with one big railroad man after another coming out openly with statements that unless there is a change in the Commission's attitude a number of important properties will find themselves in difficulty, it is hardly to be wondered at that investors are becoming chary about putting their money into railway securities. While it is realized that the railway men who have been making these strong statements are, so to speak, interested parties, Mr. Escher asserts that "by the very frankness with which such men as President Ripley, of the Atchison; President Brown, of the New York Central, and President Finley, of the Southern, have been stating their case, they have convinced a good many thinking people that this is no mere attempt on the part of the transportation interests to get more money out of the shippers, but an honest attempt to preserve the integrity of the industry in which they are engaged.

"The proportion of the public, however, which has been reached by the fair and frank statements of Messrs. Ripley, Brown and Finley, and the others is almost inconsiderable in comparison with the very large number of persons who believe that the railroads are making plenty of money and that their rates, if anything, should be reduced and not advanced."

The still prevailing popular but erroneous beliefs that capitalization effects rates and that lower rates mean lower commodity prices, are given as the two horns of the dilemma upon which the railroads are at present impaled. "Only by getting the facts before the public, so that it may see how utterly unlikely such interference with freight rates is to bring about lower prices, can public sentiment toward the railways be dissuaded from its pursuit of this *ignis fatuus* and brought back to solid ground.

"Before anything in that line can be accomplished two great misconceptions must be corrected. The first is that freight rates have anything to do with capitalization—that is to say, that what a railroad charges for carrying freight should in any way be influenced by the value of the railroad's property. The second is that anything can be gained for the shipper or the general public by limiting railway profits—that is to say, by passing laws that a railroad shall be allowed to earn only so-and-so much on the amount of money invested in the property.

* * * * * * *

"What is the remedy? How can confidence in railway securities be restored? In one way and in one way only: by putting before the public the facts in the case and relying upon that to bring about correction of the prevalent misapprehension concerning freight rates. Let the public once see the true position the railways are in and there will be a speedy end to the talk about 'valuation' and legal limitation of profits. Very quickly then will follow the restoration of railway securities to that high degree of investment favor they enjoyed but a very few years ago."

Digitized by Google

Necessity for Higher Rates.

THERE appears a growing tendency on the part of business men to recognize the necessity for some readjustment of transportation charges to a higher level. The press of the country is printing daily, expressions of opinion from prominent men advocating some such readjustment, and it has become a well recognized fact that railway investments under existing conditions are proving unattractive to investors. In commenting on this phase of the railway problem, F. J. Lisman, of New York, recently said:

"We have now arrived at a period when the investment public here and abroad, has read so much about the anti-railroad legislation and the unprofitableness of railroads, and has had unsatisfactory experience with investments in railroad securities, it does not care to purchase any more railroad securities, especially those of enterprises which have not been tested by time. The natural consequence is there is less new mileage being constructed; the weaker companies cannot get any money, therefore cannot improve their railroads, and under the Sherman anti-trust law the stronger railroad companies cannot even avail of the opportunities of buying the weaker ones at a sacrifice, because this would be construed as preventing proper competition.

"The public as a whole is really not down on the railroads, but the politicians have stirred them up to think it is. As a consequence the service is not being improved in certain districts as it ought to be, nor is the country being opened up at the same rate as it was ten years ago. Unless the tactics are changed, conditions will get much worse.

"President B. A. Worthington, of the Chicago and Alton, says:

"'Bearing in mind that the railroads are face to face with a period of thorough reconstruction which will involve enormous expenditures, the question is: Where will we be able to get the money? We are denied the right to increase our rates for transportation; we are hampered and harassed at every turn and corner in our earnest struggle to enforce economies or to create additional sources of revenue, we are denied privileges which would tend to produce less operating costs; taxes, wages and the prices of material have advanced arm in arm in rapid strides in recent years. As these factors are inflexible, there is little likelihood of relief from any of these demands in the immediate future.

"'These are the actual exigencies which the railroads face to-day—the economic problems which they must solve to be able to respond to the commands of commerce; and unless we can find a way and means to adjust these conflicting conditions and at once, we soon shall reach, if indeed we have not already passed, the glory of our youthful vigor as a commercial nation; and, this is the real railroad question of to-day. In preparing our answer, we must not fail to remember that financial credit is a child of emotion, fitful and fanciful, to be coaxed by the hope of reward which must not be withheld; if once betrayed, we as a nation may as well prepare for the call that summoned Rome, Greece, Egypt, Babylonia—all nations that wilfully and deliberately violated a sacred code of honor, the law of progress, the evolution of mankind.'"

State Railroad Ownership.

EVIDENCE is constantly accumulating to show that Government ownership of railroads in whatever countries tried has met with but indifferent success. In fact in a number of instances it has placed a heavy additional tax upon the people with no improvement of facilities. The following editorial from the *Financial America* throws some interesting light upon the results obtained through the nationalization of the Western Railway of France:

"Those in this country who advocate State railroad ownership will derive little comfort from the published result of the nationalization of the Western Railway in France. Since its nationalization in 1909 it has cost the taxpayers on an average $12,000,000 each year to make good a deficit. In 1909 the deficit was $7,750,000; in 1910, $11,700,000; in 1911, $14,000,000; in 1912, $16,000,000; and, for 1913, the budget estimates a tax upon the people of $18,000,000. When the line was operated by the company the cost of the taxpayers never exceeded in any one year $5,400,000, which was paid under a State guarantee of interest. The press of Paris regards this result as a crying scandal and protests indignantly against the unbusinesslike and reckless management of the Western Railway under State operation.

"'No matter what the States takes up,' says *Le Temps*, 'the management is characterized by disgraceful waste, if not by pillage.' In substantiating this statement our contemporary refers to the rebuilding of the national printing works, which was to cost $600,000, but required an actual expenditure of $2,000,000 of public moneys and consumed eleven years to complete. It also accuses the Government of waste and extravagance in reference to ammunition and matches, two industries operated by the State. Another important point in connection with this State-owned railroad is its neglect and indifference in the manner of drafting its annual report. While private railroad companies in France issue reports and make public accounting of their receipts and expenses shortly after the close of each business year, the directors of the Western Railway issue their report whenever they please, and upon one occasion delayed the publication thirteen months. Apparently, the more we investigate municipalization and nationalization schemes the less are we attracted to them."

Attitude of the Public Towards Large Corporations.

THE *Bache Review*, a summary of the general financial and business situation issued by J. S. Bache and Company, of New York, discusses in a recent issue the attitude of the American public towards large corporations. It says in part:

"There is a settled hostility in the minds of a vast number of people in America against big corporations and interests. This has been brought about by the overbearing treatment inflicted upon the public by railroads and public utility companies in the years gone by. In these companies, and in some of those handling commodities which the people were compelled to buy anyway, there was no necessity for inducing custom by courteous treatment. The companies adopted the fatal policy of indifferent or domineering dealing with the public. This is something that an American will

Digitized by Google

not stand. He is perfectly willing to pay good prices for good service, but he resents being snubbed. His resentment, smouldering at first, has, in the course of years, been fanned by newspapers and politicians into stubborn opposition and enmity and finally into open warfare. The attitude of much of the public service has been changed, many abuses have been corrected, but this is not sufficient. Above all, just treatment must be accorded in every instance, but the big men and their subordinates all along the line must go to the people themselves and explain and promote friendship by hand-to-hand acquaintance. The American public is just, and has good judgment and brains, but it must be made to understand through personal contact. The winning of favor must be undertaken with as much courteous solicitude and constant activity as great and small concerns use in getting customers and new business, or the politician in securing votes. A campaign of country-wide operation must be undertaken.

"In no other way, it seems to us, can this tide of popular disapproval and resentment be stayed; a tide which it is dangerous to disregard, and which, unchecked, may sweep the great machinery of business onto the rocks."

In another issue it calls attention to the following warning recently issued by Professor Hadley, of Yale:

"I am afraid that neither the public nor the Government is awake to the real state of things. In our endeavors to control corporations we, too often try to lessen their efficiency instead of increasing it. We are appalled by one railroad accident, and we suggest that every engine should have two engineers instead of one. A fast train runs off the track, and a Government officer suggests that people ought not to want to travel so fast.

"If these views prevail the days of America's greatness are done. A people that believes in divided responsibility and waste of time has no future.

"What is to be done in the face of this state of things? In the first place we must continue to reward the efficient man. The fact that competition will no longer do this automatically must make us all, as part of our public duty, lend a hand to the men who are getting things done. We shall deal with the problems of corporate regulation and with the abuses of corporate management more effectively if we are willing to appreciate efficient service."

Misdating Bills of Lading.

THE following admonition by the *Northwestern Miller* to the milling trade might well have the attention of other shipping interests which are indifferent to the new order of business and still seek to procure advatages at the risk of being charged with criminal offense:

"It seems incredible, but it is actually true that, despite all that has been said on the subject, the frequent exposures with their costly results in settlements and damages, the full and clear exposition of the dangers and penalties attending such acts, there are millers who still endeavor to induce the representatives of the carriers to misdate shipping documents and who even attempt coercion and threaten retaliation if their desires are not complied with.

"It would seem that such inciters to unlawfulness are peculiarly dense of comprehension or else they will never be able to understand the enormity of the offense they propose to commit, until they are detected and rigorously punished.

"Time and again the *Northwestern Miller* has warned the shipping public against this practice, once not uncommon but now as rare as any other criminal proceeding. Still some millers persist in believing that to misdate a bill of lading is merely a business peccadillo of no particular significance or consequence.

"They will not understand that times have changed and there is no longer the latitude in such matters there used to be a few years ago. To misdate a bill of lading is now a penal offense, and if discovered will be severely punished. To ask the agent of a carrier as an 'accommodation' to utter a false shipping document is exactly the same in principle as to request him to forge a signature or to commit larceny. It is distinctly criminal, and subject to punishment as such.

"Moreover, if, in order to hold business, he should be such an utter fool as to commit this crime, and if it should be detected, as it most assuredly would, he will not be alone in suffering punishment. The man who knowingly procured the false document will receive the same penalty as the agent by whom it was signed.

"It seems strange that some millers cannot or will not understand the present status of the misdated bill of lading. Always morally culpable, it is now specifically and legally criminal. The miller who asks it is inviting the agent to perform a distinctly illegal act. He who attempts to coerce another into criminal action is equally guilty. It is precisely the same as if the miller demanded as the price of his further business that the agent should forge a check or steal money. It is a gross insult to a reputable man to suggest such a thing, and the miller or the miller's representative who does it commits an indefensible and contemptible act.

"The *Northwestern Miller* is heartily weary of reiterating the warnings against misdating bills of lading or attempting to do so. Enough ought to be enough. It only hopes that the next shipper who tries this dishonest game will be detected, or exposed, fined and sent to jail, where he certainly belongs."

Arbitration Under the Erdman Act.

NEWSPAPER editors in various sections of the country are emphatic in their praise of the Eastern railway managers' decision to arbitrate their difficulties with their firemen under the provisions of the Erdman Act. A number of editors apparently fully appreciate the soundness of the carriers' contention that such a law is inadequate to handle a situation of this kind properly, owing to the fact that the arbitrators are but three, with only one independent, but they nevertheless heartily endorse the evidence of public spirit which has influenced the managers to accept arbitration under the only legal device now available. The following brief editorial from the Baltimore *Sun* is indicative of the attitude towards this question of a number of the leading journals:

"That the railroads have agreed to arbitrate their differences with the firemen by the Erdman Act method is gratifying. There was much force in their contention that an arbitration board of

Digitized by Google

three men, two of whom are confessedly partisans, could not be expected to reach as just a decision as one of five or seven members, but the Erdman Act is the law of the land, and until it is changed no party to an industrial dispute that refuses to abide by it can be in a wholly favorable position before the public.

"Congress should take up the question of amending this Act, to the end that compulsory arbitration may be provided, if possible, and if not, that some act similar to that in force in Canada may be put in operation here."

Defrauding the Railroads.

WITH our legislative halls ringing with the eloquent appeals of our political reformers, with public officials ever on the alert to elevate business morality, and with business itself being lifted to a higher plane of integrity and fair dealing, it seems incredible that at the very fountain head of all this uplifting activity, we should find one of the Nation's public departments compelling the railroads to perform a great and expensive service for which no compensation has been provided. This, however, is exactly what has occurred under the operation of the new parcel post law. Millions of packages are now being transported by the carriers at an enormous aggregate expense and no provision has so far been made to compensate the railroads for this additional service. Furthermore, the understanding the Congress will probably sooner or later provide some form of compensation for this service does not in the least mitigate the glaring unfairness with which the railroads have been dealt with. On the contrary, it shows the deplorable conditions which may develop under a control or regulation which is not governed or influenced by financial responsibility.

In the New York *Commercial* of February 18th, the situation is summed up in the following manner:

"The *Philadelphia Inquirer* calls attention to a point worthy of consideration. That is the increased cost to the railroads in distributing the parcel post matter from one end of the country to the other. The general proposition is put in this fashion:

" 'By the instituting of the parcel post mail there has occurred an enormous increase in the weight of the mails carried by the railways of the country, an increase not contemplated nor allowed for at the time of the last weighing of the mails by the Government for the purpose of basing the mail pay of the various railways in the United States.

" 'The railways are carrying this increased mail promptly, securely, speedily and faithfully, and as yet no provision has been made for paying the railways for this increased service, so well performed, and which is costing them large additional expenditures in the handling, the transportation and through additional facilities necessary in many ways.'

"Just what the increase is in the weight of mail carried is not easy at present to estimate. It must necessarily be enormous, if the reports that come from a thousand sources as to the large avail of the new privileges are half true. Probably a 25 per cent surmise would understate the facts. It is a service which is certain to increase vastly. In course of time no doubt any injustice in this respect relative to increased payment will be rectified; but in the meanwhile the carriers, it is alleged, are doing their work faithfully at a loss on an old rating, continuing without reference to increase of obligation and expense on the part of the railroads."

Transportation of Perishable Freight.

IN its railway and industrial section for February, the *Financial Chronicle* calls attention to the proposed legislation in several States affecting the marketing of fruit, vegetables, meats and other food products which makes the question of the transportation of perishable freight a particularly live one. Commenting on recent developments along these lines the *Chronicle* says:

"A general spirit of unrest has been fanned by the difficulties which an ordinary housekeeper finds confronting him. Remedies are supported by ill considered laws framed as the result of commissions that are often times actuated by political motives. The effect of the summary laws proposed for universal minute inspection and severe arguments penalizing as a body, market men and carriers alike, may defeat the end in view.

* * * * * * *

"Reforming legislators, before drafting revolutionary measures, would do well to make themselves thoroughly acquainted with the steady progress towards co-operation now being made by the representative organizations of carriers and shippers."

Attention is called to an address recently delivered by E. D. Levy, assistant general manager of the St. Louis and San Francisco Railway, before the Western Fruit Jobbers' Association, in which the question of the transportation of perishable products is discussed in detail:

"The plan outlined by Mr. Levy for the co-operation of carriers and fruit jobbers, which would also necessarily benefit producers and consumers, deserves consideration in every State of the Union. It is that local organizations of fruit or other merchandise jobbers should appoint transportation committees to work out with the carriers the problems of distribution of perishable freight."

Mr. Levy states that the earning per gross ton per mile are less on fruits and vegetables than on corn, flour, coal, iron, cement, brick, lime and lumber. He also asserts "that there is more to be gained by arrangements between the carriers and the shippers for the adoption of uniform schedules and regular delivery than by urging them to make excessively fast schedules. On a reasonable schedule, railroads can handle the perishable freight with some degree of profit, but this margin quickly vanishes when the size of trains has to be reduced and greater expenses are incurred in order to obtain a proportionately faster speed.

"Taking a broad view, Mr. Levy suggests that any laxity which may be found on the part of either carriers or shippers in the transportation of perishable freight may be removed by co-operation along intelligent lines, to improve the methods of the transportation and distribution of less-than-car-load perishable freight. This may be brought to as good a state of regular, dependable service as the transportation of the United States mail, even if not as fast. But full satisfaction will only be possible by the willing co-operation of the shippers, and especially in giving the freight proper protection while in transit to and from the railway terminals."

Confiscated to the Public

By George Dana Mumford,

Of the New York Bar.

A YEAR or so ago, Mr. Brandeis told a public, eager to believe the worst, that the railroads of this country could save a million dollars a day, if certain new practices of shop efficiency, suitable to certain industrial plants but not proved to be adaptable to railway operation as a whole, were introduced.

Although the Commerce Commission brushed the suggestion aside as without any real weight of evidence to support it, the effect on the great mass of the public was to create an impression that railway management is inefficient.

Reduction in Operating Costs.

Nobody rose up to point out what the railways had actually done in the way of reducing operating costs. No railway Daniel raised a voice to say that the actual achievements of the railroads in the past fifteen years in reducing the unit cost of transportation amount to-day to over five hundred million dollars a year, or One and One-Half Million Dollars a Day! Nobody rose up to point out that the public and not the railways had reaped the entire benefit of all this.

For it is a demonstrable fact that the public has not only appropriated all the savings effected by the railways through increased operating efficiency for the last fifteen years, but the public does not even know that it has done so.

There is a time honored story that serves to illustrate the situation: "General Grant," cried a boy, rushing up to the Commander of the Federal Forces and pointing to a hill where an active battle seemed to be raging, "Yon hill must be took." "Boy," said General Grant, "Yon hill is took."

Strangely enough the proofs that the hill had been taken were lacking.

Financial writers have been talking for years about the increased operating efficiency of our railroads, due to improvements in roadbed and rolling stock, to the reduction of grades and elimination of curves, to heavier motive power and bigger freight cars, to increased carload and trainload, to installation of double tracks and passing tracks, and yet nobody has been able to tell us what were the savings due to all of these factors of increased railroad operating efficiency.

No one has come forward to tell us what was the actual saving in unit-cost,—the cost of carrying a ton of freight a mile, or a thousand tons of freight a mile, or a passenger a mile—due to these factors in increased operating efficiency.

Effect of Increased Expenditures.

Every railroad man knows that as the freight density of his road increases, the cost of handling freight should materially decrease. Every railroad man knows that by increasing his freight trainload fifty per cent., he should materially reduce his 'cost of movement.' But when he comes to go over the actual operating results for the year and compares his unit-costs with the unit-costs of say ten years ago, he finds that his present costs, instead of being lower are actually higher—five or ten per cent. higher—than they were ten years ago. All his efforts for greater efficiency have apparently gone for nothing. He is like a man rowing against the tide. In spite of violent exertions at the oars, he finds himself being steadily carried out to sea.

Now the tide against which the railways have been rowing and against which all their efforts for higher efficiency and all their millions spent to secure greater facilities have been of no avail, is the tide of Higher Prices.

If you imagine our rower rowing against a tide running six miles an hour, to prevent it from carrying him out to sea, and after rowing steadily for six hours finding that in spite of his efforts he has been carried six miles out to sea, you wouldn't claim that his being carried six miles out to sea was proof that he didn't know how to row. Instead, you would try to figure out how far out to sea he would have been carried if he hadn't rowed against the tide!

If by not rowing at all he would have been carried thirty-six miles out to sea, and by rowing to the limit of endurance he was still carried six miles out, you would realize that our rower actually rowed thirty miles, the difference between where he would have been if he hadn't rowed and where he actually was. You wouldn't say that his unpleasant plight was due to his own inefficiency. Put mathematically, the sum that he had been set to do was: $-36+30=-6$; and you would say that that was a pretty discouraging sum to be set to do, whether in rowboats or railways.

Now that is exactly the sum that the railways in this country have had to work out since 1896.

If we hadn't known how fast the tide was running out, we could not have known the result attained by rowing; but knowing that, we know exactly the result of our rower's effort translated into miles rowed.

But the railroads have been in the position of not knowing how fast the tide of higher prices was running against them, and therefore, were unable to tell what the actual results of their increased operating efficiency were in terms of the percentage of saving in unit cost.

All they knew was that instead of increased volume of traffic and increased operating efficiency causing any visible or tangible reduction in unit operating cost, their unit cost had increased some six per cent. That instead of increased volume being carried at a lesser unit cost, it is actually carried at a greater unit cost; —that operating expenses are increasing out of proportion to gross earnings. The more efficient a railway manager is, the more exasperated he becomes over the apparently fruitless nature of his struggle to stem the tide.

Railway accounts are so complex and operat-

Digitized by Google

ing results so variable,—dependent upon changes in volume of traffic and trainload on the one side, and on fluctuations in prices and wages on the other,—that it has seemed almost impossible to figure out what is the precise increase in the unit cost of transportation due solely to higher prices, and what on the other hand is the offsetting saving in unit cost due to the various factors of increased operating efficiency.

We know, however, that the actual results that finally emerge in the operating account are not simple figures at all, but are the final results of the battle between two opposing forces. Higher prices tend to increase costs. Higher efficiency tends to lower them. The final cost is the resultant of these two forces. If, comparing the average results of two three-year periods, ten years apart, as say 1898-1900, and 1908-10, we find that the unit cost of transportation in spite of a 57 per cent. greater volume of traffic and a 48 per cent. heavier trainload, increased 4 per cent., we know at least that the unit operating cost has increased on account of higher prices 4 per cent. more than the higher operating efficiency has been able to offset it. This 4 per cent. increase in unit cost is no more a reflection on the efficiency of railroad management—as the efficiency engineers would have us believe—nor a proper index of the actual increase in operating cost due to higher prices, than the six miles the rower was carried out to sea by the tide was the measure of his efficiency in rowing, or an index of the actual speed of the tide.

Improved Operating Efficiency.

In order to get an idea of the actual results over that ten-year period, in order to take account of stock and see what improved operating efficiency has really done for the public, we must find some way either of measuring the different factors of increased efficiency in terms of reduction in unit cost, or of ascertaining what the increase in unit cost over those ten years have been, due to higher wages of labor, higher prices of material and higher standards of operation.

Wages advanced about twenty-five (25%) per cent. during that period, and prices of commodities about fifty (50%) per cent., but they did not advance uniformly either together or separately.

Instead of going up steadily, two or three per cent. a year, they may have advanced seven per cent. in one year, and declined two per cent. in another. And it is due to these fluctuations in prices of materials that it is so difficult to estimate the exact effect on the operating account per traffic unit of the increase in prices.

Where it is a gradual advance, it is almost unnoticed at the time. An increase in prices of materials of three per cent. in any year does not seem very much, but an increase of three per cent. a year for fifteen years means an increase of 45 per cent.

It is only by comparing two periods, ten or fifteen years apart, that we are able to realize the extent of the increase.

Now the real increase in operating cost per traffic unit, due to higher prices, taking the combined operations of all the railways of the United States for the ten-year period, comparing the three-year average of 1898-1900 with 1908-1910, was between 28 per cent. and 30 per cent., say 29 per cent.

But the actual result of these combined operations in 1908-1910 showed an increase in unit cost over 1898-1900 of only about 4 per cent. So the sum set us to do is a perfectly simple one. Unit operating costs would have advanced 29 per cent. in the ten years but for the extraordinary efforts of the railroads to increase their traffic capacity, and their operating efficiency. Unit costs in the face of these efforts actually advanced 4 per cent. Therefore, increased operating efficiency on the part of the railroads during the same period resulted in an actual saving or reduction in unit costs of 25 per cent. But this 25 per cent. in unit cost never saw the light of day. It was progressively absorbed and more than offset by the 29 per cent. increase in unit cost due to higher prices. It is the old sum of adding $+25$ to -29. The result is only -4, $(-29+25=-4)$.

So that, as in the case of the rower we had to figure how far he would have been carried out to sea if he hadn't rowed against the tide, in order to ascertain the actual result of his rowing, so with the railroads we have had to figure how much unit costs would have increased if the railroads had not so vastly increased their operating efficiency in order to ascertain what was the real extent of the saving of this increased efficiency.

This 25 per cent. reduction in unit operating cost in the ten years is an actual positive result of all the factors of increased efficiency. It is no less actual because it is not visible to the naked eye in railway operating accounts. If this saving of 25 per cent. in unit operating costs had not actually taken place in dollars and cents, due to improved operating efficiency, the average cost per traffic unit,—per ton per mile, or per 1,000 ton miles, or per passenger per mile,—would have increased in those ten years twenty-nine per cent. (29%) instead of four per cent.

Low Level of Present Rates.

I have taken the trouble to figure out what would have been the cost of railway operations in 1896 if the railroads had then operated under the wages and prices existing to-day. The result is an interesting commentary on the question of the reasonableness or unreasonableness of the present level of railway rates, which is slightly lower than the level of 1896.

If the volume of traffic of 1896 had been carried by the railroads at the level of wages and prices of to-day, the cost of handling the traffic (including fixed charges and taxes) would have been seventeen per cent. more than the total passenger and freight receipts. The railroads of the country, treated as one great system, would have had to pay out $117 for every $100 they took in!

Between 1896 and 1910 the railroads of the country succeeded in effecting by increased efficiency an average reduction in ton mile cost of 32 per cent. as against an average increase in ton mile cost due to the higher level of prices of 29 per cent.

Since 1910, the increase in unit cost due to higher prices has increased to 37 per cent., and is still increasing, while 1910 seems to have been

Digitized by Google

the high water mark of railway operating efficiency.

The increase in operating cost due to higher wages and prices has caused a serious skimping in maintenance charges, the effect of which is to reduce the general operating ratio about one per cent. below what it should normally be, if proper maintenance charges were made.

The average operating ratio of all the railroads of the country for the year 1912 is 69.1 per cent. The average operating ratio for 1910 was 66.29 per cent. But the difference between these two operating ratios does not accurately reflect the increase in operating cost to the railways in the past two years due to higher prices, for the reason that the 1910 ratio is too high, due to excess maintenance charges, and the 1912 ratio is too low, due to too small maintenance.

In 1910, a year of large traffic, the railroads made up for skimping maintenance in 1908 and 1909 by increasing maintenance charges over normal to an amount that increased the operating ratio by over one per cent. The operating ratio of 1910, on the maintenance basis of 1908-1909, would have been only 63 per cent. instead of 66.29 per cent.

Effect of Higher Wages and Prices.

In 1912, the railroads being under the ban of the Commission in regard to rates and being compelled to pay higher wages and prices for materials, again skimped normal maintenance charges by one per cent. So that allowing for a proper maintenance charge in each case, the true operation ratio in 1910 was 65 per cent. instead of 66 per cent., and in 1912 was 70 per cent. instead of 69 per cent

Now a difference between 65 per cent. and 70 per cent. in the operating ratio means an increase of 7¾ per cent., practically eight per cent. in unit costs,—in the ton mile cost and the passenger mile cost. So that ton mile costs have actually increased eight per cent. since 1910!

And they are still rising! The consensus of opinion of the world's economists is that general prices will continue to rise about 2 per cent. a year for the next fifteen years. And if general prices continue to rise, wages must continue to rise, and railroad unit operating costs must continue to rise!

As against this general increase in unit operating costs imposed upon the railroads by economic forces entirely outside of their control, the different railway systems have made more or less successful headway through increasing operating efficiency, and increasing their traffic facilities. But the amount of the total savings of increased operating efficiency of each of them has also not been entirely under their individual control, but has rather been determined for them by the accident of location, affecting volume of traffic, as well as by the character of that traffic determining the possibility of effecting further economies, through larger trainload.

Tapping the great Pittsburg manufacturing district, the foresight of Mr. Cassatt, and the unlimited financial credit of the Pennsylvania system, enabled it so to expand its traffic capacity that it was able to increase its freight density from 2,840,000 to 5,139,000 tons per mile of road, or an increase of 81 per cent. By increasing its own intensive efficiency it increased its average freight trainload from 240 tons to 649 tons, or an increase of 170 per cent.

From these factors of increased operating efficiency the Pennsylvania should have realized a reduction in unit costs of 32 per cent. But as a matter of fact, it did not effect a reduction of more than 27 per cent.

As a result, the actual cost per traffic unit increased, in the fifteen years between 1896 and 1910, about two per cent. But this advance was due solely to the higher general level of prices, and was, in the face of an actual average reduction in cost per traffic unit, effected by the Pennsylvania through increased intensive operating efficiency, of 27 per cent.

The fact that the Pennsylvania failed to achieve the full saving that it should have been entitled to, was due not to lack of operating efficiency for the efficiency was there, but to something that should give us all pause in considering the pressing problem of the present plight of the railroads.

Limit Reached in Freight Density.

The Pennsylvania failed to harvest the full fruits of its increased operating efficiency, because its enormous freight density had reached the point of saturation, had passed the point of highest economic traffic capacity. Every railroad, whether single-track, double-track, four-track, or six-track, has this maximum point of economic traffic capacity. Pass that point and the cost of carrying additional freight begins to increase out of all proportion to its original cost. Under extreme conditions, as on the Wabash and Missouri Pacific, the operating ratio may run up to over 80 per cent. of the gross receipts, or even higher. But here is the premier railroad system in the country,—which during the past fifteen years has poured hundreds of millions of new capital and over two hundred millions of surplus earnings into increasing its traffic facilities,—showing that in spite of this enormous outlay, it has actually reached and passed the point of economic traffic capacity.

Requirements of the Future.

And if the greatest railroad system in the country, in spite of doubling its capital investment, has reached its limit of economic traffic capacity, how about all the other systems that have not begun to spend as much proportionately as the Pennsylvania in increasing their facilities? Does the public know how close to this limit they are today?

If the traffic of the country as a whole increases 80 per cent. in the next ten years as it did in the decade from 1900 to 1910, and did in the previous decade from 1890 to 1900, how are the railroads going to handle the business of the future without billions of new money poured into double tracks and four tracks and six tracks and terminals and rolling stock? And how are the railroads going to get these billions without first regaining the confidence of the small investor? And how can the railroad industry regain the confidence of the small investor, as a profitable field for investment, if its rates are held down and its costs are forced up, and its net return is less than that obtained in any other industry?

With all the savings of increased operating

Digitized by Google

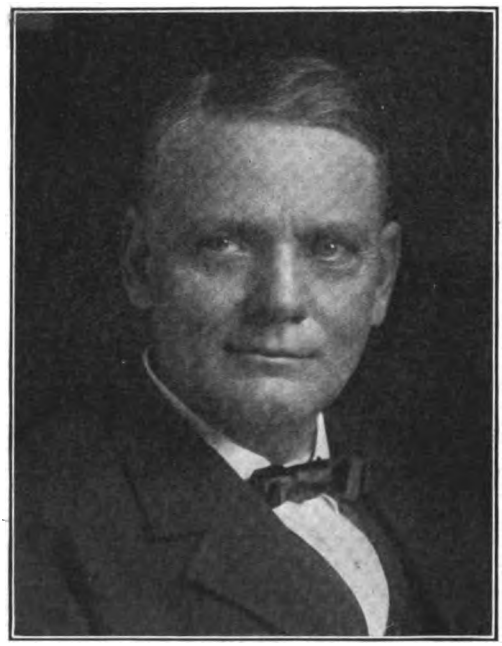
efficiency of the past fifteen years confiscated to the public as soon as made, with continuous rising prices forcing costs up and improvident Government regulation holding rates down, with the existing railroad plant now loaded to maximum capacity, with railroad credit so impaired that the strongest roads must pay fifty per cent. higher interest for new capital—and yet with the growing business of the country imperatively requiring that railroad facilities shall be doubled within ten years, it is not the railroad industry alone, but the business of the country itself that will soon find itself between the Devil and the Deep Sea.

It is unbelievable that this condition should be allowed to continue,—that the American business man and laboring man should not awake to the fact that when we strangle railroad expansion with higher costs and lower rates, we are strangling the future business of the country.

Conservation of Human Life in Railway Operations

By RALPH C. RICHARDS,

CHAIRMAN, CENTRAL SAFETY COMMITTEE, CHICAGO AND NORTH WESTERN RAILWAY.



RALPH C. RICHARDS.

THE "Safety First" movement on railroads originated on the Chicago and North Western Railway and it stands for the conservation of human life. And it was made necessary because we had learned from sad experience that we can not make men careful by passing laws, for that has been tried and failed, or by overlooking the human element, the most important thing not only in railroading, but in all business, as, regardless of all such laws, the deaths and injuries kept on increasing until finally we got our eyes open to the fact that the laws could not do what it was supposed they could,—that is, prevent accidents happening. So it was decided that something else must be done to prevent this awful waste of human life and stop the making of cripples, widows and orphans, as neither the workingman, the employer or the public could longer stand any such drain.

How badly some action was needed is shown by the September, 1908, Bulletin, issued by the Commissioner of Labor of the United States, which, on page 458, shows 35,000 workingmen killed in industrial accidents each year, or *one every fifteen minutes* of every day in the year, and the injury of two million every year, or *one every sixteen seconds of every minute and hour* and day in the year, and, contrary to the general understanding, only ONE-TENTH of the deaths and ONE-SIXTEENTH of the injuries were railroad men, the other NINE-TENTHS and FIFTEEN-SIXTEENTHS being workmen employed in the other industries of the country, but because the railroads were the only ones who reported their accidents to one central authority where they could be tabulated and published, they were the only employers of labor who have been generally criticised because so many of their workmen were killed and injured.

If the question were put to any assemblage of men as to what was their most precious and valuable possession next to their wives and children, I think they would vote unanimously that it was their lives and their limbs, not their bank accounts, property, their jobs or their credit, and yet our lives and limbs are the very possession of which we railroad men, during the last fifty years, have been the most careless and about which we have taken the most chances.

REASONS FOR AMERICAN RAILWAY ACCIDENTS.

The railroad list of casualties, as shown by the last report of the Interstate Commerce Commission for the year ending June 30th, 1912, was 3,635 railroad men killed and 142,442 injured, or nearly ten per cent of all the men employed on the roads, of which 3,235 were killed and 50,097 injured in operating accidents and 400 killed and 92,363 injured in industrial accidents, such as accidents in shops, roundhouses, offices, stations and repair yards.

Some of the reasons we have so many more accidents in this country than they do abroad are:

That we are a nation of chance takers. We take a chance on anything from a horse race up or down.

Because our lines are so much longer than those abroad that it is much more difficult to exercise the same supervision over the men and the property that they are able to do in smaller countries;

Because so many of our men, especially in the track, shop and roundhouse service, are foreigners and cannot understand or speak our language, making it exceedingly difficult

Digitized by Google

to instruct them how to do the work safely and properly;

Because we had so many accidents, we necessarily had to inject into the force so many new and inexperienced men who increased the risk and decreased the efficiency.

Conditions on the North Western.

The management of the North Western Railway, being both farsighted and humane, recognized, perhaps earlier than most other employers of labor, the great suffering that was caused by avoidable accidents resulting in death and injury to its men, passengers and others, and because of that, as well as for the further reason that, during the year ending June 30th, 1910, our accidents causing

Death to employes increased	37%
Death to passengers increased	38%
Death to outsiders increased	19%
Injuries to employes increased	38%
Injuries to passengers increased	27%
Injuries to outsiders increased	12%

determined about two years ago to inaugurate a movement to reduce accidents, both as a matter of humanity and for the purpose of increasing the efficiency of its organization, as every time a capable, experienced employe was killed or injured, it not only brought suffering and sorrow to himself or family, but necessitated the employing of a new man in his place, thereby increasing the risk to other men in the service and at the same time decreasing the efficiency of the organization, frequently very seriously.

For example: Take the case of the foreman of a switch engine coming over from Wood street to 40th street. On the way over he met another engine which was stalled with a train. At the request of the crew of the stalled train he coupled on his engine and pulled them over to 40th street. When he got there he uncoupled his engine and sent it ahead, then started to walk over to it. The engine which he had assisted over from Wood street started up without ringing the bell, ran over and killed him. The rules require that bells shall be rung when an engine is about to move and while switching on the elevated tracks. If that had been done in this case, a man's life would probably have been saved, and a widow and three or four children would not be left in mourning, destitution and misery. And think how much less time it would have taken to start that bell than it did to make a report of the accident, and how much it increased the risk to the rest of the men to have such a man taken out of the service and the man who caused his death left in the service.

The work of organizing and directing this movement was assigned to me and I was glad it was because it seemed to me that the knowledge and experience I had gained in the investigation and settlement of accident claims ought to be of some benefit to the men on the road that I had grown up with, as well as to railroad men generally, and if others could have seen that vast army of injured men, those regiments of widows and orphans and dependent fathers and mothers that have passed through my office during the last thirty-two years, they would realize, as I do, the necessity of some practical method being adopted to prevent accidents.

Beginning of the Safety Movement.

We commenced by holding meetings on all the divisions of the system and explained to the men what we were trying to do and its necessity;

That it was the men and not the stockholders, officers or foremen who were being killed and injured and paying the fearful toll in death and injury;

That it was the men and their families who would be most benefited by the prevention of accidents;

That the golden rule in railroading,—"It is better to cause a delay than to cause an an accident" should always be observed.

We also tried to impress on them—

That it actually took less time to prevent an accident than to report one.

Take the cases of men who are injured by stepping on nails. We had 121 of them last year. How much less time would it have taken in each of those cases to have turned down the nail or thrown the board that had the nail in it in a pile where no one would step on it, than to make a report in each case?

That when we needed new men, if we had fifty per cent fewer accidents on our road than other lines had, we would have the pick of all the best railroad men in the country. Wages and other working conditions being practically the same on all railroads, all the good men would want to work on the railroad where there was the smallest risk of being killed or injured;

That it was the little accidents that make up the big total, just as it is the little things that count everywhere.

Illustration from "New York Central Safety Magazine."

HOLE WHICH SHOP EMPLOYE STEPPED IN RESULTING IN HIS DEATH.

ELIMINATING THE CARELESS HABIT.

During the fiscal year ending June 30th, 1912, we had 70 employes killed and 5,907 injured. Three of them were killed and 158 injured in collisions and derailments, the rest of them in little accidents that are happening every day, that could and should be prevented by the exercise of care, or, in other words, twenty-two out of twenty-three employes were killed and thirty-six out of thirty-seven were injured in little accidents; the other one killed and injured being in big accidents or in collisions and derailments; consequently, it was the little accidents we wanted to get rid of; the big ones would then take care of themselves.

To illustrate: A section foreman has neglected to block the frog or the guard rail; some trainman or switchman goes between the cars to fix the coupling, his foot is caught and he goes down. Nothing can save him and when he comes out after one of those 100,000 capacity box or gondola cars has gone over him, he is either a corpse or a cripple for life. It is just such accidents that make up the majority of the awful total, not collisions and derailments.

That we wanted to get rid of the careless habit and acquire the safety habit;

That we want to stop making cripples and widows and orphans;

That it was the duty of every employe to report to some member of the Safety Committee or other proper officer all defective conditions and methods that might cause an accident before, not after, an accident occurred;

That the greatest risk a careful man runs is the risk of injury from some careless fellow worker and that when the careless man will not change his ways and try to do better, he should be gotten out of the service.

Take the men loading rails: Someone lets go before he should; the rail falls and some track man is injured. Or, take the case of the men coming in at night on handcars; they get to racing and before we know it a collision occurs and several men are injured, occasionally one killed; or, take the case of rails or ties piled or left too close to the track; some trainman or switchman comes along, falls over them in the dark and is killed or injured. All of such cases could have been prevented in less time than it takes to make a report.

That it takes less time to learn to do a thing right than to explain why you did it wrong.

Let us take, for example, a gang of trackmen going to or from work on a hand car. Suddenly a train comes in sight, the men stop the car and some of them attempt to get it off, but before they succeed the engine strikes the car, someone is killed and another railroad widow and six or seven orphans are left in poverty and destitution, all of which could have been avoided if the engineer had slacked up and given the men a chance to get the car off safely, but he took the chance, thinking they would get off, with the usual result; or, if the men on the car had kept a proper lookout and started to get the car off in time, the accident would have been avoided.

That every accident is a notice that something is wrong,—just as the red board is a notice to stop,—with the men, plant or methods, and should be immediately investigated by the person in charge of work to ascertain the cause and apply a remedy;

That every employe was responsible for the safety of others, as well as himself;

That in case of doubt, adopt the safe course. Speed must always give way to safety;

That if we could reduce the accidents fifty per cent, the assessments for life and accident insurance which we are all paying ought to be reduced in the same proportion, and if we could do that, more men would carry such insurance.

Take the case of the trainman whose duty it was to go out to flag and protect the passengers on his train, but who fails to do so and is caught and injured or killed in the collision; or the engineer whose duty it is to watch for signals but

THE UNSAFE WAY OF CUTTING OFF A NUT.

THE SAFE WAY OF CUTTING OFF A NUT.

who fails to do so, runs by, and into another train or washout and is killed or injured; or, the case of the trainman or switchman who goes between moving cars, or who leaves a car on the side track not far enough in to clear a man riding on the side of a car on another track, and frequently it is the man who so leaves the car who is killed or injured.

How much better it would have been if they had remembered that it is better to be careful than crippled.

ORGANIZATION OF SAFETY COMMITTEES.

Safety Committees were then organized on each division of the road, composed of the three division officers and one or more representatives from each class of labor, such as engineers, firemen, conductors, brakemen, switchmen, trackmen, stationmen, signal men, bridgemen and car men.

The same committees were organized in the larger terminal yards, the members being yardmasters, switchmen, engineers, firemen, trackmen and car men.

Committees were also organized in the shops composed of all classes of labor,—always the men who were doing the work and getting hurt (not the bosses) being the large majority of the membership. These committees meet once a month. The men serve not less than six months or more than twelve and are paid for their time and expenses while attending meetings.

Then the Central Safety Committee was organized, composed of eleven general and division officers, representing all branches of the service, of which committee I am the chairman and to which committee all Division, Shop and Yard Committees report and to whom all changes in standards, rules and customs are submitted, and if approved, are referred to the management for adoption. All matters local to the division, shops and yards are disposed of by such committees without reference to the Central Safety Committee, but the recommendation made and the action taken is reported. During the two years these committees have been in existence over ten thousand dangerous conditions have, through their efforts, been remedied and some conditions, practices, rules and standards applying to the whole system, have been changed or improved.

Every member of the committee is furnished with a safety button as his badge of office and is made to feel that in the meetings all are on a par and each comes there as a committeeman, not as an officer or employe, and that all are full partners in the enterprise and responsible for its success. Suggestions that might bring about greater safety and efficiency in operation were not only invited but solicited.

Postal cards were furnished to the members of the committee and employes generally, on which immediate notice can be given to the chairman of the Division Committee of dangerous conditions and practices, so that the same can be remedied immediately and not wait for the meeting.

The members of the committees are furnished with a copy of the monthly report of the Central Committee, detailed report of all accidents by divisions, statements of accidents by causes, and a statement of avoidable accidents that happened the previous month and the same are also posted on Safety Bulletin Boards.

Slips are put on pay checks of all employes each month, calling attention to specific acts of carelessness, to rules or other things that may cause or prevent accidents, a different one being gotten up for each month, so as to avoid sameness and repetition.

After the work was well under way, it was decided to award a banner to the division having the fewest accidents in proportion to the number of employes and train mileage, and the Central Safety Committee awarded that banner to the Sioux City division in 1911 and to the Wisconsin division in 1912. I believe that it is the first time that such an award has been made in the history of railroading in this or any other country. A similar banner was presented to the North Avenue Yard, Chicago, for the best record for safety in yard work in 1911.

EXTENT OF SAFETY COMMITTEES.

There are now about 650 officers and men serving on these Safety Committees, and, if Benjamin Franklin's saying, "The eyes of the master can do more work than both his hands," is true, surely 650 pairs of eyes trained to look for defective conditions and improper practices, can do more than the eyes of one person or fifty persons, and the results that have been attained during the time the safety organization has been in existence would seem to demonstrate the truth of the saying. And we have shown a very gratifying improvement in the matter of cleaning up obstructions in yards, station platforms, shops and roundhouses, cleaning windows, putting up rail-

Digitized by Google

ings at dangerous places, covering gearing of machines, blocking frogs and guard rails, in putting a stop to danerous practices and customs and in repairing cars, engines and machines, which has brought about not only greater safety, but also more efficient operation.

Reduction in Accidents.

We also show the following reduction in our accident record for the year ending June 30th, 1912 as compared with the year ending June 30th, 1910, the latter being the last year before the Safety Committees were organized. In this statement all cases of injury where a man loses one day's time or more are counted, whereas in the reports made to the Interstate Commerce Commission and railroad commissions generally, we report only the cases where the injured employe loses three days' time or more:

17 fewer trainmen killed; decrease of 44.7%.
1562 fewer trainmen injured; decrease of 47%.
9 fewer switchmen killed; decrease of 50%.
11 fewer switchmen injured; decrease of 17%.
3 fewer stationmen killed; decrease of 50%.
134 fewer stationmen injured; decrease of 18.3%.
7 fewer trackmen killed; decrease of 25%.
700 fewer trackmen injured; decrease of 40.1%.
2 fewer bridgemen killed; decrease of 66.6%.
87 fewer bridgemen injured; decrease of 27.7%.
1 fewerShop and RHman killed; decrease of 25%
190 Fewer Shop and RHmen injured; decrease of 15%.

1 car repairer killed in 1912.
31 car repairers injured in 1912.
1 unclassified employe killed in 1912.
31 unclassified employes injured in 1912.

37 fewer employes killed; decrease of 34.6%.
2722 fewer employes injured; decrease of 31.5%.
2 fewer passengers killed; decrease of 18.2%.
207 fewer passengers injured; decrease of 22.3%.
65 fewer persons killed; decrease of 29.5%.
104 fewer persons killed; decrease of 29.5%.
3048 fewer persons injured; decrease of 28%.

	1912.		1910.	
	Killed.	Injured.	Killed.	Injured.
Employes	70	5907	107	8629
Passengers	9	721	11	928
Other persons ..	170	487	235	606
Total	249	7115	353	10163

Uncollected Lumps of Coal Spilled From Train, a Source of Danger.

Credit to Rank and File of Employes.

The credit for bringing about this reduction in accidents belongs to the rank and file on our railroad, as they have done the work.

This not only means that in those twelve months we have had 104 fewer paper reports of people killed and 3,048 fewer paper reports of people injured than we had during the twelve months ending June 30th, 1910, but that 104 fewer times did we have to call the priest and the undertaker; that 104 fewer times were widows and orphans made and sorrow and sometimes destitution brought into families; that 3,048 fewer times was some one injured, often perhaps permanently; that just that many fewer times did we have to call the doctor and that in our own railroad family 2,732 times did we avoid increasing the risk to other employes, our passengers and patrons by taking experienced men out of the service and putting green ones in their places, and that just that many fewer times did we avoid decreasing the efficiency of our organization.

Accidents Not Inevitable.

This result has been obtained because we have learned that accidents were not inevitable, as we had commenced to believe, but, on the contrary, a large proportion of them can be avoided by the exercise of care and because we have all worked in harmony to bring about an improvement.

If this twelve months' work is an indication of what we can do in the future, it would certainly seem to show that the plan which we have adopted, in which ENTHUSIASM and CO-OPERATION FOR SAFETY IS THE KEYNOTE, will surely result as the years go by in greater SAFETY and REGULARITY, which is what we all want.

And when we commence to exercise the same care in the selection of new men and in educating them as to their duties that we do in the selection and care of new machinery, cars and engines,—and somehow it has always seemed to me that men were the important element on a railroad, or in any business, not the machine,—we will have safer and more regular operation and fewer accidents.

We have devoted much time to getting fine engines and tracks, better cars, better apparatus and better safety things, but very little time or attention has been paid to getting *safety men*, and if we had devoted as much time and thought to getting safety men as we have to getting safety things, and educated the men after we got them, as they are now doing on the Union and Southern Pacific and some other roads, our accident record would be different.

Spread of the Movement.

The following roads, with a mileage of 151,530 miles, have adopted the same safety organization as the North Western or one very similar, and many other roads are now considering the matter:

	Mileage.
Baltimore and Ohio	3,449
Baltimore and Ohio Southeastern	985
Bessemer and Lake Erie	220
Buffalo, Rochester and Pittsburgh	573
Canadian Pacific (Lines East)	5,000
Canadian Pacific (Lines West)	6,812
Chesapeake and Ohio	1,962
Chicago, Burlington and Quincy	9,003
Chicago Great Western	1,496
Chicago, Indianapolis and Louisville	617
Chicago Junction	298
Chicago, Milwaukee and St. Paul	7,296
Chicago and Eastern Illinois	1,300

INDORSED BY INTERSTATE COMMERCE COMMISSION.

Attention is also called to the following extract from the 1912 report of the Interstate Commerce Commission:

> "Great possibilities in the direction of a solution of the problem of accident prevention lie in the so-called safety committees which have been organized on many roads. These committees are composed of officers and employes who co-operate in striving to eliminate accidents due to failure of men properly to perform their duties. By making 'safety first' the dominant idea in the minds of employes, and continually pointing out methods for its attainment, an important step in the right direction is taken.

It is so rarely that the Interstate Commerce Commission has commended anything that has been done by the railroads that I take pleasure in quoting this extract.

What it will mean to the workingmen of this country, their families and dependents, to the industries employing them and to the public generally if, by concerted and enthusiastic effort and co-operation we could bring about a reduction of 25 to 50 per cent in the fatalities and injuries must be obvious to everyone. I am satisfied from the little experience that I have had that it can be done.

Emerson says: "Every great and commanding movement in the annals of the world is a triumph of enthusiasm." Whether a movement tending toward safety in industrial operation, or, in other words, a movement FOR THE CONSERVATION OF MEN, is a great and commanding movement depends perhaps, upon the point of view from which the subject is considered; but if, as to most of us, life is the most precious of our possessions, any movement for the preservation of life ought to be a great and commanding one and should be enthusiastically supported by every working man, as well as by every employer, and with such support it must necessarily be successful.

SPIRIT OF CO-OPERATION.

The organization and work of the Safety Committee has, I think, created a greater spirit of co-operation and good feeling between the rank and file and the officers of company because their monthly meetings have made an opportunity for them to get acquainted and as that acquaintance grows, as it must through continued association, the feeling of good will and mutual interest and co-operation must necessarily increase, and it has also provided a method of presenting in an orderly and proper manner to the officers of the company the suggestions and ideas of the men and what the men think as to how the work could be made safer and the operation of the road more efficient and regular.

It has, I believe, largely increased the efficiency of the organization by keeping the old, experienced men at work who previously were only too often taken out of the service by reason of accidents, and avoided the introduction of many new, inexperienced men in the work. How much easier and with how much more regularity, promptness and safety the trains on a railroad can be run when in twelve months 17 fewer trainmen, 11 fewer switchmen and 7 fewer trackmen killed, and 1,567 fewer trainmen, 111 fewer switchmen and 700 fewer trackmen injured than it had during the preceding twelve months, your readers can readily understand.

As the men acquire the SAFETY habit and become more careful of themselves, their fellow employes, passengers and others, it seems to me that they must necessarily become more careful not only of the property of the company, but also of the property intrusted to the company for transportation and consequently, operation must necessarily be not only more efficient but more economical.

The Prevalence of the Trespassing Evil

THE Special Committee on Relation of Railway Operation to Legislation have recently published a bulletin in which is graphically shown the extent to which trespassing on American railroads is indulged in with its resultant fearful loss of life. Attention is called to the fact that, according to reports issued by the Interstate Commerce Commission, 5,434 trespassers lost their lives during the year ending June 30, 1912, which was more than 50 per cent of the entire loss from all causes. It is also pointed out that to save the lives of the passengers and employes of the railroads, legislation has been passed and is proposed which will involve the expenditure of $1,500,000,000, with an annual cost of more than $75,000,000. Here it is pertinently stated that all that would have been needed to save the lives of the 5,434 trespassers referred to would have been the passage of proper legislation prohibiting trespassing with a sufficient penalty attached to make such infringement of the law unpopular. This would cost the public nothing and would save to it the vast economic loss involved in the constant death of its citizens. Trespassers are not, as are generally supposed, tramps or hoboes but are principally workers who use the railways right of way presumably for a short cut to or from their home or place of business.

The public little realizes the extent of this evil, nor the awful consequences thereof. The report of the Interstate Commerce Commission show that in twenty years—1890 to 1909, inclusive—86,-

Digitized by Google

733 trespassers were killed and 94,646 injured on the railways of the United States. For the last two years their reports present the following figures:

Trespassers killed, July 1 to June 30, 1911	5,284
Injured, same period	5,614
Trespassers killed, July 1, 1911, to June 30, 1912	5,434
Injured, same period	5,687

Detailed statistics show that most injuries to trespassers are very serious in character, such as the loss of limbs, or other permanent disabling injuries. More than 50 per cent of *all* persons killed on the railways of our country are trespassers.

A very large proportion of these unfortunates are not mere "vags" or "tramps" or "hoboes," but are children or useful citizens, valuable members of society, killed or injured through their own carelessness. Very many of the injured, very many families of the killed, become public charges.

There is no more right or reason why these people should trespass on the tracks or vehicles of the railways than they should upon the private driveways and vehicles of the citizen.

This fearful loss of life and limb can be checked only by the intervention of the law making and law enforcing powers.

All laws should have for their primary object the protection of the citizen, the children and those who are mentally unbalanced, and the prevention of all injury to members of society. The absence of laws preventing and making it a crime or misdemeanor to trespass upon the tracks and property of railroads, where there is constant danger, induces people to expose themselves to the dangers, and walk along the tracks, and to climb on engines and cars, where they have no legal or moral right to be, where they are liable always to be brought into contact with powerful and dangerous machinery, where, of necessity, engines and cars must be operated, and that can be operated nowhere else.

In the absence of such preventive laws, the average citizen is led to believe that railroad tracks and property are public highways upon which they have the right to be, and minors and children, following the example of their elders, also flock upon the tracks, engines and cars, turntables and other property, and the saddest and most heartrending of all railroad casualties are those which result in the death of and permanent serious injuries to minors and children who frequent the yards and play on cars, turntables and engines of railroad companies.

When you look at the statistics it is hardly believable that in as highly a civilized country as ours such things are permitted, but the authorities and the parents of these minors apparently take no action to prevent this fearful roll of death and misery that is occurring every day and every hour on the railroads of this country.

The railroads themselves cannot take any preventive measure, for the reason that they have no law back of them giving them the right or authority to exclude these trespassers from their property.

They cannot even warn the people against the use of their tracks as foot paths. What would be the form of the warning or objection to be served upon the public, and upon whom should the service be made? A painted notice put up along the right-of-way, warning persons to keep off the tracks? We have these notices now from one end of the road to the other—every station in Illinois has a notice to minors to keep off railroad property, but they are not sufficient, as shown by the statistics to stop the continual trespassing.

One of the great evils and living menaces to the whole country, and especially to farmers and residents of small villages and towns, is the hobo, tramp, yeggman, who uses the tracks and property of the railroads on which to ride, walk and sleep. The statistics are appalling, when you analyze them, both as to casualties to them, and the depredations they are committing in their peregrinations through the country, robbing box cars, burning ties, depots, bridges and timbers, robbing farmers, country banks, stores and post-offices—thievery, robbery and arson.

Should laws be enacted making it a crime or misdemeanor to trespass upon the property of railroads, railroad and municipalities of the State would soon see to it that the trespasing nuisance was abated and would not be tolerated. There are but few tramps in Canada. They have there a statute making it a crime for a person to walk upon railroad tracks. The statute is as follows:

Chap. 37 R. S. C., 1906, Section 425:

Every person who—

(a) Wilfully breaks down, injures, weakens or destroys any gate, fence, erection, building or structures of a company; or,

(b) Removes, obliterates, defaces or destroys any printed or written notice, direction order, by law or regulation of a company, or any section of or extract from this Act or any other Act of Parliament, which a company or any of its officers or agents have caused to be posted, attached or affixed to or upon any fence, post, gate, building or erection of the company, or any car upon any railway; or,

(c) Enters upon any railway train without the knowledge or consent of an officer or servant of the company, with the intent fraudulently to be carried upon the said railway without paying fare thereon; or,

(d) Wilfully obstructs or impedes any officer or agent of any company in the execution of his duty upon any train, or railway, or upon any of the premises of the company; or,

(e) Not being an employe of the company, wilfully trespasses by entering upon any of the stations or cars or buildings of the company in order to occupy the same for his own purposes;

Shall be liable, on summary conviction, to a penalty not exceeding Fifty Dollars, or, in default of payment, to imprisonment for a term not exceeding two months.

This statute practically prevents trespassing upon railroad property in the Dominion of Canada. The statistics of the Wabash road, that operates over 244 miles of road in the Province of Ontario, show that the percentage of trespassers killed or injured there is only three per cent of the whole number killed and injured on that line, the 244 miles being approximately ten per cent of the road mileage.

As shown by the table of statistics, a large number of persons who are killed or injured are not tramps or hoboes, but farmers, working men, laborers and other citizens who live in the vicin-

Digitized by Google

ity, and who use the tracks and right-of-way for their own convenience.

This fact should be a greater incentive for the authorities to have a law enacted that will prevent such trespassing, and thereby reduce this kind of fatalities.

A statement of trespassers killed and injured in the United States and Great Britain and Ireland for years 1901 to 1910, inclusive, shows that in the United States there were 50,025 trespassers killed and 53,427 trespassers injured. Great Britain and Ireland, 4,435 killed and 1,319 injured during the same period. There were 14 trespassers killed and 14 trespassers injured every twenty-four hours—over one per hour—in the United States in that period, while in Great Britain and Ireland there were one trespasser killed and one trespasser injured every twenty-four hours. Of the 53,425 trespassers injured and 50,025 killed, in the United States 13,000 were under the age of 14 years, 20,000 between the ages 14 and 21. In other words, there have been enough minors killed and injured in the past ten years in the United States to more than make a mile post for every mile traveled in a trip around the world.

During the year 1911 there were 5,204 trespassers killed and 5,614 trespassers injured in the United States on railroads, and the recent statistics published by the Interstate Commerce Commission show that for the year ending June 30, 1912, there were 5,434 trespassers killed and 5,687 injured on steam railroads of the United States.

These statistics show that the trespassing problem is growing year by year, and that it should receive the serious attention of the State legislatures, to the end that such laws be enacted so that authorities and the railroad companies may co-operate in endeavoring to abate this evil.

One writer says:

"The apathy and indifference shown by our law makers towards the trespass question is worthy of mention, especially in view of the many guardianship measures recently passed. Our public men are chanting requiems over our treeless tracts, viewing with alarm soil erosion and the disastrous consequences, pushing back, with an iron hand, the greedy speculator who would butcher our coal lands in far away Alaska. The alleged germ-laden drinking cup has been snatched from the hand of the unsuspecting public. The life line has been thrown out to muskrats and squirrels. Safeguards have been cast about the birds in the air and the fish in the sea; oysters, dumb and unable to vote, are watched with infinite care. The Bureau of Entomology is spraying hackberries and blackjacks, slippery and other elms; rich prizes are being hung up for anyone who can successfully sandbag the boll weevil, that cotton may grow; mounted guards are protecting jack rabbits on our game reservations, and yet the United States government is permitting thousands of its citizenship to be killed and mangled annually without making one move to protect them from their own folly. Magazines and newspapers are periodically informing the public about the terrible butchery on American railways, presenting comparative statistics between this country and Europe, but seldom, if ever, state that over fifty per cent of those killed in the United States were not passengers or employes and had no business upon the tracks. The fact is rarely cited, also, that trespassing is not permitted upon European railways, either by the higher or lower animals."

The Attitude of Labor Unions Towards the Greater Safety Movement

EDITOR'S NOTE:—We print below a letter recently written by Mr. James O. Fagan, railway signalman on the Boston and Maine Railway to the New York *Times*, in which it is asserted, in substance, that if there is a "safety first" movement in progress on the railroads of the United States, it is neither helped nor sanctioned by the great brotherhoods of employes who have been striking, are striking, and will be striking for higher pay. The *Times* asserts that Mr. Fagan is a qualified witness as it was he who proposed eight years ago that "we, the men in the operating departments, should be invited to band together in a Safety League." Mr. Fagan's criticism is aimed not so much at the railway employe as against the leaders of the brotherhoods who, the *Times* editorially states, "had always frowned upon and discouraged any such democratic relationship between employes and managers as such a banding together would form." The spirit of the times, however, backed by an overwhelming popular sentiment, is sharply opposed to obstructive tactics which militate against the conservation of human life, and sooner or later such leaders will be brought to the full recognition of this fact. Mr. Fagan's letter follows:

THE so-called "Safety First" movement which is now becoming so popular on American railroads has more social and industrial significance than is generally supposed.

For one thing, it will be noticed that not a particle of assistance has yet been received from the great brotherhoods of railroad men acting collectively, or from their leaders. Of course, it is absolutely necessary in the interests of safety on railroads that the brotherhoods should be drawn or pushed into this "Safety First" enterprise. A glance at the annual report of the Interstate Commerce Commission, dated Dec. 16, 1912, will bring out this point with considerable emphasis. It reads:

> "The most disquieting and perplexing feature in the problem of accident prevention is the large proportion of train accidents caused by dereliction of duty by the employes involved. Of the eighty-one accidents investigated up to September 1, fifty-two, or more than 63 per cent of the whole number, were caused by mistakes on the part of employes. * * * * The most numerous failures were by trainmen or enginemen.".

While management and hosts of individual employes have the safety problem well in hand, its further development is now blocked by the leaders of the big brotherhoods. This statement, of

Digitized by Google

course, calls for a prompt explanation. The leaders I speak of are not employes of any railroad. They are in receipt of handsome salaries. Their duties consist specifically and in the main in boosting wages and bettering conditions. They also act as the medium for arranging schedules and settling disagreements. But in carrying out the details of this program we find these labor leaders not only indifferent, but lined up most emphatically in opposition to the "Safety First" principle. To be sure, they have not made any statements to this effect. They are men of deeds, not words. In fine, it is their recognized mission to agitate, foment and engineer a strike on any railroad where any kind of a grievance can be unearthed and dragged to the surface.

To be still more specific, these leaders are now playing the payroll and its influence over the men against the safety movement. The control of this payroll, that is to say, the dominant power in drawing it up and arranging its provisions, is vested in the leaders of the brotherhood. Railroad men are human, and when their leaders come to them and say, "Look here, boys, what do you say to a little more money?" the whole situation resolves itself into a payroll proposition. Now, the fomenting and engineering of strikes is a recognized and necessary feature of the campaign of the brotherhoods to increase the wages and better the conditions of employes. At the same time, as I look at it, there can be no possible fellowship or understanding to-day between a strike of enginemen, firemen, or trainmen and the "Safety First" movement.

For example: As I am writing these lines I read in the newspapers that "Shut down or take your chances with a lot of new and inexperienced men" is the ultimatum of the brotherhoods to the management of the Bangor and Aroostook Railroad in Maine. Several accidents have already been reported at the hands of these new men, and right here in this connection it should now be clearly understood by the public that, all things considered, there are in the industrial world no better conditions, no better wages and no fairer treatment than such as obtain to-day on American railroads.

A strike, therefore, for the purpose of adding a few cents to the daily wage of a worker is simply an insult to that goodwill and sentiment of the people which have consistently assisted the railroad man's cause and have finally succeeded in placing railroad labor on a very high and satisfactory basis. The railroad strike is also a direct insult to the multitude of people who are now working early and late to uplift the worker in other industries, with the idea that satisfactory conditions and liberal wages will ultimately be returned to society in terms of satisfactory service. But now, to-day, not only on the Bangor and Aroostook Railroad in Maine, but practically on all railroads, the people and their interests are threatened with a "tie-up" in the name of more money and less work. Look where you will, the excuse for a strike on railroads is nearly always said to be in the interests of so-called uniformity.

Carefully nursed and interpreted by the leader of the brotherhood, this uniformity is a shifting, flexible scale of wages of the will-o'-the-wisp variety. It keeps bobbing up in unexpected quarters all over the country and is continually being adjusted in terms of its highest level. Consequently, on the railroads, so far as the payroll is concerned, the expressions, to make it uniform, to standardize, and to boost, have one and the same significance. Meanwhile the traveling public is made the victim of this surprising industrial situation, and is coolly invited to suffer in general or to walk in particular.

The way out of this tangle is simplicity itself. In a word, the employes can be trusted if we can get rid of the machine that is *working them.* And this machine would die a natural death if only it were deprived of its weapon, *the payroll.* In this way also the dilemma of the manager in dealing with discipline, the safety problem, and the wage issue, in the same breath as it were, would be dissolved once and forever. That is to say, when the Interstate Commerce Commission is given authority to license the men and regulate the payroll, "Safety First" will finally come into its own.

In the natural course of events, and in the name of the people, the Interstate Commerce Commission now finds itself heir apparent to all this industrial muddle. In the interests of safety and reasonable management, it will soon be called upon to show its hand and explain its understanding of the labor situation in relation to safety. In the twenty-sixth annual report of the Commission some five pages are devoted to information relating to the investigating of accidents. Under the law of May 6, 1910, we read that "valuable information respecting the causes of railroad accidents" has been secured and it indicates the need of more effective measures than have thus far been taken to secure safety of railroad travel. In the main, such matters as rails, ties, the track, carelessness, excessive speed, the responsibility of the traveling public are the principal features of this safety discussion. To anyone either on the inside or out, however, who pretends to have the slightest knowledge of the situation, it will surely seem passing strange that the simple words Labor Union, Brotherhood, Schedule or Grievance Committee do not appear in this report nor are they referred to or hinted at in any way.

When one comes to consider that the railroad itself, safety problem included, is to a very great extent directed and controlled by the contents of the schedule and the action of the Grievance Committeess, it is surely reasonable to expect that two years and a half of investigation would be sufficient to get a word or two about these fundamental factors in the safety situation into the annual report.

Meanwhile the Interstate Commerce Commission has very definite work in hand in relation to the "Safety First" movement. It should examine and license the employes in the train and engine service and in this way eliminate so far as possible the careless and inefficient workers. In the second place, it should regulate wages and in this way eliminate the "strike." In doing this, as I take it, the Commission will take the labor situation on railroads by the horns. I'm quite aware there will then be *something doing,* but never mind. Let the influence and power of the Interstate Commerce Commission be extended to include the regulation of the payroll and then the people at large will immediately get an inkling of what the country has to face and expect in the matter of Government ownership. Sooner or later the Government must get acquainted with these Brotherhoods and, as I look at it, in the interest of safety on railroads, the sooner the better.

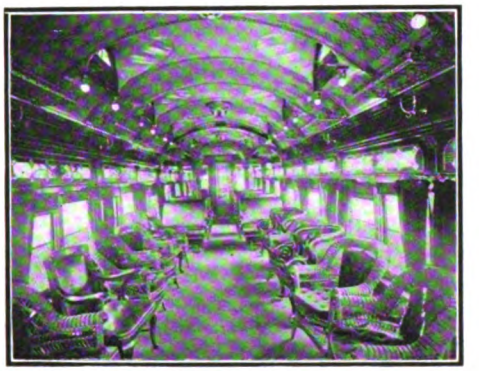
Economy in Gas-Electric Motive Power

THE first gasoline electric locomotive ever built is expected to be in operation on the Minneapolis, St. Paul, Rochester and Dubuque Railroad which operates between Minneapolis, Minn., and Northfield, Minn., after May 1st, 1913. This new locomotive will be 39½ feet long, 20 feet between truck centers, 6 feet 10 inches wheel base, 12 feet 8 inches in height from rail to top of radiators, with a height from rail to floor line of 3 feet 7 inches. The diameter of each of the eight drive wheels will be 33 inches. The locomotive is to be of all-steel construction, and will develop a maximum of 640 horsepower from its two gas electric engines with a normal capacity of 250 horsepower each. It will contain an air compressing set and lighting generator, capable of lighting ten passenger coaches with twenty 16-candle-power lamps each. The additional cost to manufacture this number of lights will not exceed five cents per hour for additional fuel. When once placed in service, it can be ready for service any time night or day on five minutes' notice, compared with from four to six hours preparation by steam locomotives.

The weight of the new locomotive will be fifty-four tons as against the weight of the average steam locomotive of 115 tons. This means a smaller ratio of fuel required to maintain an equal ratio of tractive effort and speed. Two 200-gallon tanks will be carried for gasoline, which when filled will weigh 12,000 pounds, as against the weight of an engine tender of 33,000 pounds. The tanks hold sufficient fuel for a trip of 500 miles. The radiators at the top of the gas electric locomotive will hold about 500 gallons of water, weighing about 4,000 pounds. This would be all the water required to run a gas motor a month. One operator or motorman is all that is required for operative purposes.

Two separate units have been provided for in the engine. Each of these contain eight cylinders. When the locomotive is pulling three or four cars, the use of but one of these engines will be required, but when double that number of cars are to be hauled, sixteen cylinders are placed in service by simply turning a valve. In other words, only such power is necessary to place in service as the weight of the train load requires.



INTERIOR OF GASOLINE ELECTRIC MOTOR CAR.

The accompanying illustrations show the exterior and interior of the 72-foot gasoline electric steel motor cars now in use on this line. The interior view is that of a parlor car. The regular coaches seat 91 persons with additional space in the baggage room for the carrying of consider-

GASOLINE ELECTRIC MOTOR CAR OPERATING BETWEEN MINNEAPOLIS AND NORTHFIELD, MINN.

Digitized by Google

able freight or express. All-steel trailer cars seating 106 passengers are employed, while the locomotive which is to be put into service in May will readily haul from two to four of these trailer cars as conditions may require.

A maximum speed has been attained on level track with one single car of 60 miles per hour and a maximum speed on level track with one trailer of 50 miles per hour, while with two trailers, 40 miles per hour has been easily made. The distance from Minneapolis to Northfield is 38 miles, and the limited cars make this trip with eleven station stops in 77 minutes.

One of the fifty-ton all-steel cars 70 feet long, with a seating capacity for 92 passengers and a baggage room large enough to hold 40 barrels of oil can be run from Minneapolis to Northfield at the following expense:

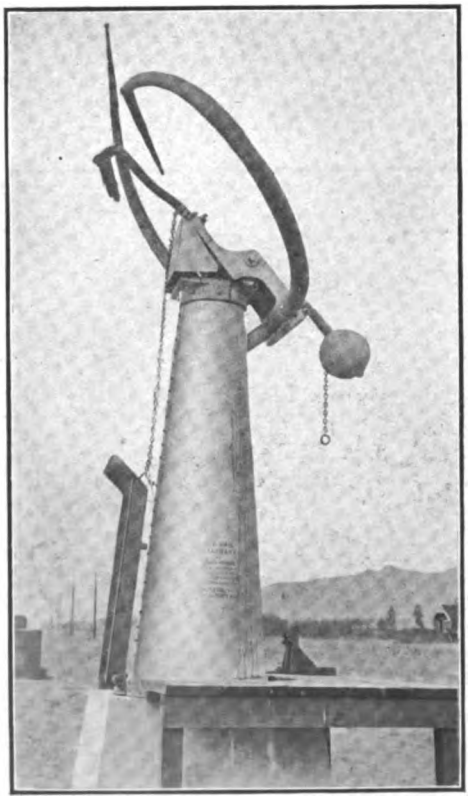
23 gals. gasoline at 12c. gal.	$2.70
2 quarts gas eng. oil at 25c. gal.	.13
1 qt. journal oil at 7c.	.02
1 lb. cotton waste	.10
1 lb. gear grease	.03
Wages of motorman and conductor	1.86
Making the total cost for the 38 miles	$4.84

These figures were taken from records and books of the company.

A New Mail Dispatcher

By ALBERT MARPLE.

TO exchange three cases of eggs while the train is traveling at a rate of fifty-five miles an hour without damaging the eggs, is the latest feat accomplished by the Jones mail exchange device, which has just been endorsed by the United States Government, adopted and installed by the Southern Pacific Railway Company on its California (Coast) division. In addition to performing this wonderful stunt the dispatcher has exchanged mail while the speed of the test train ranged from five to sixty miles an hour. The tests in the taking on and putting off of mail at the same instant in pouches weighing from 150 to 450 pounds each, proved that the lighter sacks were handled apparently with as much ease as were the heavier ones. Of the eggs that were exchanged at this rate some were set under a hen and a seventy-five per cent hatch resulted. The three cases when stuffed in the pouch completely filled it.

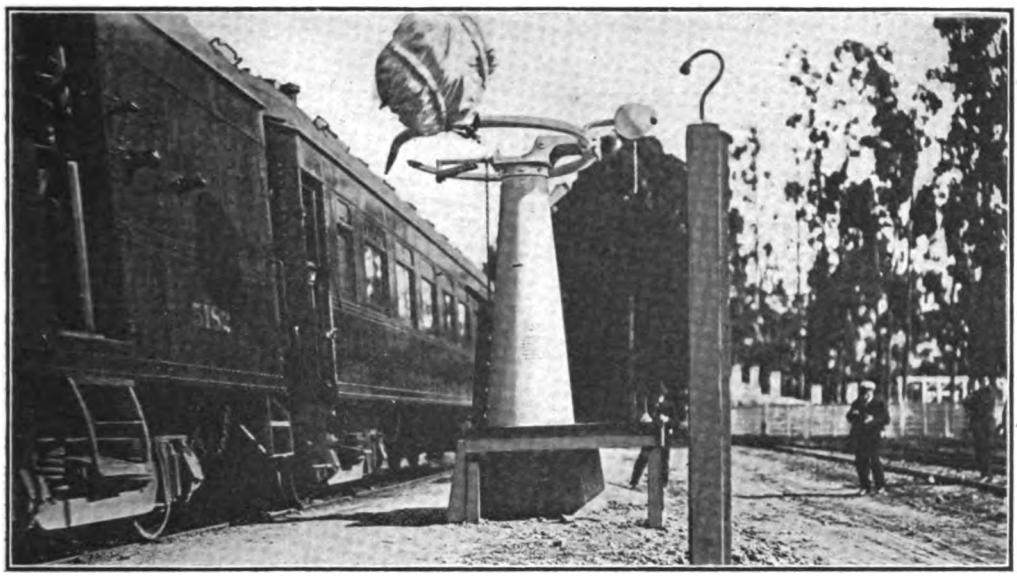


CIRCULAR ARMED MAIL DESPATCHER AND RECEIVER.

ARRANGING FOR AN EXCHANGE OF MAIL MATTER.

The principle of the Jones dispatcher is entirely different from any thus far invented. The old straight arm exchanger is entirely done away with. In its place comes a circular armed catcher. The circle made by the arms or horns is about eight feet in diameter and has overlapping points, which extend over each other about four feet on the side nearest the track. These horns are thick at the rear and taper toward the points. The arms rest in a cradle which in turn is set upon a cylindrical steel standard or crane. This standard is buried in a foundation of cement, and tapers from about two and a half feet at the bottom to one and a half feet at the top. A platform is erected upon the foundation and around the crane for the convenience of the person who sets the mail pouches in place. On the

Digitized by Google



CONSIGNMENT RECEIVED FROM FAST MOVING TRAINS.

side nearest the track resting upon the platform and connected by a chain to the horns is an iron ladder, upon which the agent stands while arranging the device for the exchange. When this ladder is lowered its weight pulls down the horns to the position ready for the transfer.

Especial apparatus for the exchanger is arranged in the car. Upon the ceiling of the car is fastened a steel track, this running from the center of one door to the center of the door on the opposite side of the car. From this track hangs a steel carriage having a delivery arm and catcher hand on either end.

When it is desired to make the exchange the mail clerk, after filling the exchange sack, fastens an especially prepared ring to the loop at the top of the pouch. This ring he puts on the delivery arm of the sliding carriage. When the train is nearing the exchange point the clerk simply pushes the carriage bearing the sack out of the car door. when it reaches a certain point it automatically locks, the one movement at the same time fastening it to the door and also setting the catcher hand, which is to take the sack from the standard. At the station the agent also attaches a sack to a ring and slides this ring into a slot at the end of the delivery arm of the standard.

The exchanging of the sack from the standard into the car and from the car to the standard is done simultaneously and with such speed that when the train is traveling at a high rate of speed one can hardly see the sacks travel. The sack from the standard is deposited on the floor of the car, while the one from the car whirls around the horn of the standard. Upon reaching the back of the horns the sack stops and its weight in addition to that of the balancer on the back of the horns causes the horns to tip backward, making the necessary law-required clearance of the track.

William H. Jones, of Manhattan Beach, California, the inventor, was impressed by the necessity of a modern mail exchanger while he was postmaster at the small town of Iola, Idaho. The danger arising from the throwing of mail sacks to the station platform seemed to Mr. Jones to be unnecessary, so he at once set about to correct this crude method.

During the tests H. W. Watkins, of the Southern Pacific, represented the railroad company, F. G. R. Moore, chief clerk of the railroad mail service, represented the Government, while William Llewellyn looked for possible constructural defects.

The portion of the Southern Pacific system now using these standards is being extended. The device is rapidly meeting with favor by officials of other railway companies, it having already been adopted by a number of other lines.

J. J. Hill Discusses Credit.—The modern industrial community, in its widest as well as in its narrowest scope, rests on credit, according to James J. Hill, principal speaker at the eighteenth annual banquet of the St. Paul Association of Credit Men. Mr. Hill's address was "On the Use and Abuse of Credit." The excessive capitalization of trusts and some less spectacular enterprises and the increase of public indebtedness everywhere, were given by Mr. Hill as the principal abuses of credit at the present time.

"The commonest form of the abuse of credit has been the issue by Governments of cheap money. Possibly the world has grown too wise to fall again into the trap of this delusion. But it is doing or permitting practically the same thing in other forms. The excessive capitalization of trusts and of some less spectacular enterprises has much the same effect as an issue of cheap money. Stocks and bonds are put out which represent little or nothing in the shape of actual values. So long as we have no effective laws compelling all stocks and bonds to be paid for at their full face value, either in cash, property or service at a fair valuation, so long will this evil continue.

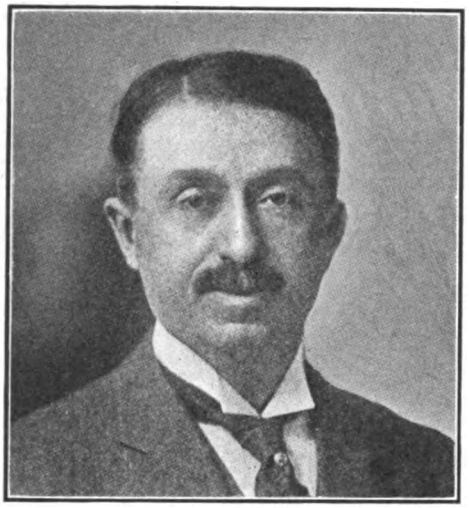
Personal



Frank Trumbull.

FRANK TRUMBULL, who recently was elected a member of the Board of Directors of the Union Pacific Railroad Company has spent practically all of his life in the transportation industry.

His participation in railroad affairs has been a large factor in the development of many roads and in the opening up of new territory, particularly in the West and Southwest, and his prominence in the railroad world has been attained by close attention to details, painstaking industry, and fidelity to the interest in hand.

Mr. Trumbull received a preliminary educational training in the public schools, and entered upon active business life at the early age of twelve. His first work was as a clerk in the post-office and in a country store at Pleasant Hill, Mo. Four years later he entered the railway service on the first of October, 1874, as a clerk in the comptroller's office of the Missouri, Kansas & Texas Railway, at Sedalia, Mo. Until 1880 he was associated with the accounting department of that road, holding, among other positions, that of traveling auditor.

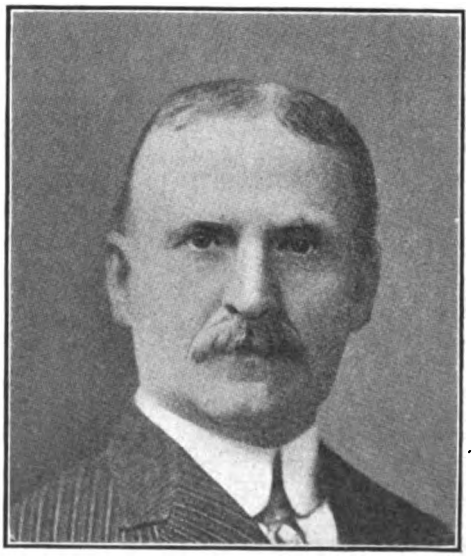
From 1881 to 1885, inclusive, he was connected with the Missouri Pacific at St. Louis, becoming on the first of January, 1886, auditor of the Texas & Pacific Railway and holding that position until July 1, 1888.

During the five ensuing years he was identified with Colorado's wholesale coal interests, and was also engaged by New York and London bankers to report upon railroad and other properties in the West. Ultimately returning to active participation in railroad affairs, he, from December 18, 1893, to January 11, 1899, served as receiver and general manager of the Union Pacific, Denver and Gulf Railway, and served the Denver, Leadville & Gunnison Railway in the same capacity from August 8, 1894, to January 11, 1899. On this latter date he was elected president of the Colorado & Southern Railway Company, which succeeded the Union Pacific, Denver & Gulf Railway Company. Later in that year he was elected president of the Fort Worth & Denver City Railway Company; in 1900, president of the Colorado Midland Railway Company; and in 1905, president of the Colorado Springs & Cripple Creek District Railway Company. During Mr. Trumbull's administration the Colorado & Southern Lines conservatively expanded, and their net earnings increased tenfold. It was one of the only two systems that increased their gross and net earnings during the panic year of 1907.

In 1909, Mr. Trumbull withdrew from many of his interests, but was persuaded to accept the chairmanship of the Board of Directors of the Chesapeake and Ohio Railway Company. He was elected to this position on February 23, 1909, and has held same ever since. He is also chairman of the Board of Directors of The Hocking Valley Railway Company, and of Missouri, Kansas and Texas Railway Company; and a member of the Board of Directors of Union Pacific Railroad Company, the Minneapolis & St. Louis Railway Company, the Kanawha & Michigan Railway Company; a director of the National City Bank of New York and a trustee of Union Trust Company of New York.

He was married on June 8, 1881, to Miss Cora Hale, who died on December 27, 1889. On April 8, 1891, he was married to Miss Mary A. Sisson, daughter of Frederick P. and Mary Ann (Field) Sisson, of Illinois.

Mr. Trumbull is a member of the Metropolitan Club of New York City; of the City Midday, Recess and Economic Clubs, and also of the Missouri and the New England Societies, the Society of Colonial Wars, the Automobile Club of America, and the Denver Club, Denver, Colorado. He is a member of the Board of Directors of the Tuskegee Normal and Industrial Institute, and takes an active interest in the affairs of the New York Committee of the Civic League for Immigrants, of which he is chairman.



ALBERT R. WHALEY.

Digitized by Google

A. R. Whaley.

A. R. WHALEY, recently elected vice-president in charge of operations of the New York, New Haven and Hartford Railroad, was born near Providence fifty years ago and started his railroad career when 16 years of age as a freight brakeman on the old Providence & Worcester at $1.62 a day.

His career from a freight brakeman to a position valued at $20,000 to $25,000 per year as the operating vice-president of the New Haven system, spans the most epoch making generation of thirty-four years in this country. From brakemen on both freight and passenger trains, baggage-master, freight and passenger conductor, trainmaster, yardmaster, and general agent at Providence of all the railroads centering there and eventually consolidating the Providence yards, and superintendent of the Worcester Division, he came to have charge of the first heavy traction electrical installation in this country which was at Providence on the line between Providence and Fall River.

He became superintendent of the New York Division in 1904 and in 1906 was chosen by the joint roads as their representative in charge of the New York Terminal upon the beginning of the construction and electrical installation for this greatest electrically operated passenger terminal in the world. All the electric and terminal change over has been under him and he has had charge of not only the operation but of the power houses, roadbed and equipment and has been chairman of the committee of seven on auxiliary facilities which has passed upon the work of more than a dozen sub-committees in more than 100 meetings, every one of which Mr. Whaley has presided over and passed upon everything relating to construction for operation, from items of minor import up to seven millions.

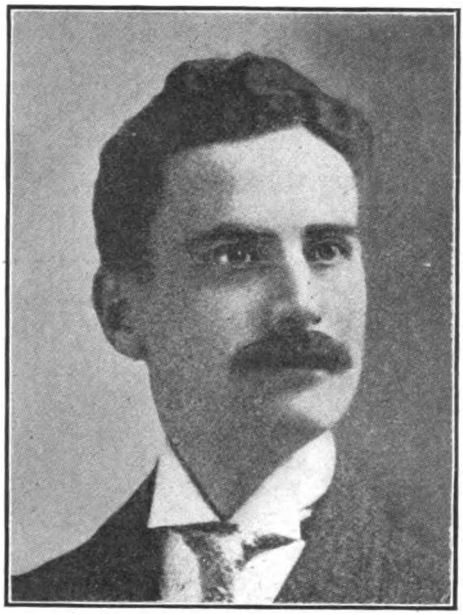
Mr. Whaley has been for seven years in charge of the Grand Central Terminal at 42nd Street which is operated jointly by the New York New Haven & Hartford R. R. Co. and the New York Central; and also superintendent of the electric zone of the New York Central, which extends as far as Croton on the Hudson and White Plains on the Harlem Division.

Mr. Whaley was formerly superintendent of the New York Division of the New Haven and therefore his return to the New Haven, which is gradually expanding its electrical zone eastward, is very natural. He will make his headquarters at the Grand Central Terminal, and in Boston.

Lewis J. Spence.

LEWIS J. SPENCE was born at Wilmington, Delaware, on September 16, 1868. He was educated in the public and high schools of Wilmington, but terminated his studies at an early age in order that he might make his own living.

He entered railroad service at the age of seventeen, and has remained continuously in this field. His first position was as a stenographer in the office of Edwin Hawley, who was then general eastern agent of the Southern Pacific Company. His association with the man who later became one of the powerful figures of the transportation world was very valuable to him. At the age of twenty-one he became chief clerk, and was later made eastern freight agent. In 1902, he succeeded Mr. Hawley as general eastern freight agent, and in 1906, became general freight agent of the Atlantic Steamship Lines, in addition to the above.



LEWIS J. SPENCE.

In January, 1911, he was appointed assistant director of traffic, with headquarters in Chicago. On January 1, 1912, he succeeded Mr. J. C. Stubbs as director of traffic of the Union Pacific-Southern Pacific Systems, and also became a member of the Board of Directors of the constituent companies.

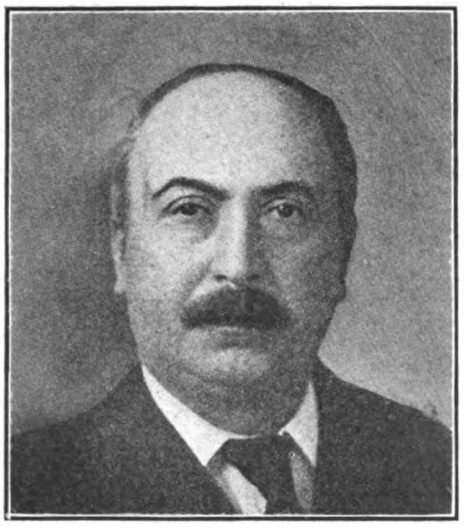
To comply with recent decree of the Supreme Court, it has been necessary to completely separate the control and management of these systems, and Mr. Spence will be director of traffic of the Southern Pacific Company, remaining a director of that Company and of its subsidiary companies.

Mr. Spence is a member of the Union League Club and the Traffic Club of Chicago, and of the City Lunch Club, the Railroad Club and the Traffic Club of New York.

David L. Bush.

DAVID L. BUSH, who was recently elected vice-president of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, was born on July 31, 1855, at Sharon, Wis. He began railway work in December, 1872, as night operator for the Western Union Railway, and was later to January, 1877, chief operator in the train despatcher's office of that road at Racine, Wis. He was subsequently, until September, 1880, train despatcher; from May 1, 1877, to January 1, 1882, also superintendent of that road and the Sabula, Ackley & Dakota, and from September, 1880, to July 1, 1887, also superintendent of the Racine & Southwestern Division of the Chicago, Milwaukee & St. Paul. On the latter date he was transferred to the superintendency of the James River Division, and from February 1, 1888, to February 1, 1890, was superintendent of the Southern Minnesota Division. He then became superintendent of the Hastings & Dakota Division, where he remained until August 15, 1894, when he was transferred

Digitized by Google



D. L. BUSH.

to the River Division as superintendent, with headquarters at St. Paul, Minn. Mr. Bush was promoted to assistant general superintendent, with office at Milwaukee, Wis., on April 1, 1898, and was made general superintendent May 1, 1903. He was appointed general manager, with headquarters at Chicago, October 1, 1909, and his election to the office of vice-president became effective on January 23.

R. Lancaster Williams.

R. LANCASTER WILLIAMS, of Middendorf, Williams & Co., who was recently elected president of the Georgia & Florida Railway, was formerly a member of the firm of John L. Williams & Sons, of Richmond, now member of the firm of Middendorf, Williams and Company, Baltimore. While connected with the Richmond firm, and also with Middendorf, Williams & Company, Mr. Williams has been very active in the development of street railways, railroads, industrial enterprises, and banks and trust companies. He was a receiver of the Seaboard Air Line Railway with S. Davies Warfield and E. C. Duncan, which receivership was most eminently successful, the property having been greatly improved physically, and the gross and net earnings increased materially, enabling the reorganization committee to reorganize the property without any assessment, or the scaling of any class of security.

Mr. Williams is now a member of the Board of Directors of the Missouri-Pacific Railway, the International and Great Northern Railway, president and director of the Georgia & Florida Railway, member Board of National Bank of Baltimore, vice-president and director of The Munsey Trust Company, vice-president and member Board of the Virginia Railway & Power Company, the Augusta-Aiken Railway & Electric Corporation, and Citizens' Fire Insurance Company of Baltimore.

E. D. Sewall.

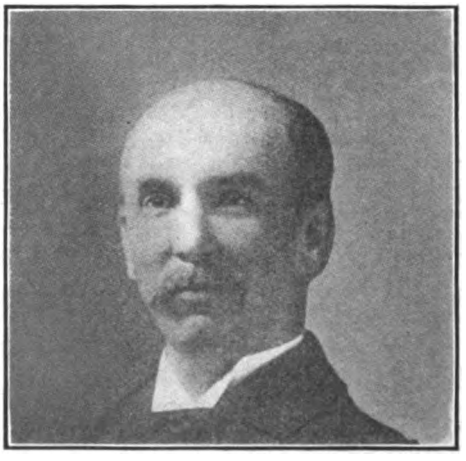
E. D. SEWALL, who was recently appointed vice-president of the Chicago, Milwaukee and St. Paul at Chicago, entered the service of this road in September, 1882, as agent at Stillwater, Minn.; prior to that time he had been connected with the engineering departments of the Northern Pacific, Chicago & Canada Southern, St. Paul, Minneapolis & Manitoba and St. Paul & Duluth Railways. He was appointed traveling lumber agent, Milwaukee, in May, 1888; commercial agent, St. Paul, in December, 1889; assistant general freight agent, Superior Division, Milwaukee, in March, 1895; general northwestern agent, Minneapolis, in March, 1898; assistant general superintendent, Minneapolis, in May, 1902; assistant to the president, Chicago, in June, 1906; vice-president, Chicago, in January, 1913. He has been vice-president of the Chicago, Milwaukee & Puget Sound Railway Company since January, 1909.

W. E. Higgins.

W. E. HIGGINS, who recently was appointed acting vice-president and general manager of the Lackawanna and Wyoming Valley Railroad entered railroad service in 1893 as a stenographer in the general freight office of the Old Colony Railroad, at Boston, Mass. This road was soon afterwards leased by the New York, New Haven & Hartford R. R. Co. December, 1895, assigned to special work for the president of that company. June, 1896, transferred to clerk in office of treasurer of The Boston Terminal Company, which was then incorporated by the railroad companies for the purpose of constructing the Boston South Station. October, 1900, transferred to stenographer to fourth vice-president of the New York, New Haven & Hartford R. R. Co., at Boston. March 1, 1903, to February 1, 1909, chief clerk to vice-president of Lackawanna & Wyoming Valley R. R. Co., at Scranton, Pa. February 1, 1909, to February 1, 1913, assistant to the general manager of the Lackawanna & Wyoming Valley R. R. Co., at Scranton.

H. R. Williams.

H. R. WILLIAMS, who was recently elected vice-president of the Chicago, Milwaukee & St. Paul, with headquarters at Seattle, Wash., has been transferred to New York as vice-president in charge of the financial and



H. R. WILLIAMS.

transfer departments. He was born on July 14, 1849, at Palmyra, Wis., and began railway work in January, 1867, with the Chicago, Milwaukee & St. Paul. He was telegraph operator for four years at various stations, then for two years was assistant train despatcher at Milwaukee, and later for eight years was train despatcher on the Hastings & Dakota and River Divisions at Minneapolis. He was then for one year trainmaster on the Hastings & Dakota and the Iowa & Minnesota Divisions. From January, 1882, to September, 1885, he was superintendent of the Iowa & Minnesota Division, and then was superintendent of the Southern Minnesota Division at La Crosse, Wis. In February, 1888, he was appointed superintendent of the Ottumwa & Kansas City Line at Kansas City, Mo., and Chillicothe, and from June, 1890, to March, 1898, was assistant general superintendent of the Northern District of the same road. He was promoted to general superintendent in March, 1898, and in February, 1900, was made general manager of the same road. In October, 1905, he was elected president of the Pacific Railway, which was incorporated to build the Washington section of the Chicago, Milwaukee & St. Paul extension to the Pacific coast, and in January, 1909, became president of its successor, the Chicago, Milwaukee & Puget Sound, which position he held until his election on January 1, 1913, as vice-president of the Chicago, Milwaukee & St. Paul.

H. E. Pierpont.

H. E. PIERPONT, who was appointed freight traffic manager of the Chicago, Milwaukee & St. Paul Railway on January 15, 1913, entered the service of the Chicago, Milwaukee & St. Paul Railway, as telegraph operator at Council Bluffs, Iowa, in 1883; occupied various positions in station and accounting department until made freight agent at Kansas City, Mo., in 1892. Was appointed division freight and passenger agent in 1893, holding such position at Winona, Minnesota and La Crosse, Wisconsin, until January 1, 1896, when he was appointed assistant general freight agent with offices at Chicago. Continued in this position until January 1, 1906, when he received the appointment of general freight agent at Chicago, holding such position until made freight traffic manager, January 15, 1913.

H. E. PIERPONT.

J. G. Hollenbeck.

J. G. HOLLENBECK, recently appointed general passenger agent of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, began railway service in 1895 as ticket agent of the Indiana, Decatur & Western at Indianapolis, Ind., and later became traveling passenger agent for the same road. In 1899 he became chief clerk in the passenger department of the Florida East Coast at St. Augustine, Fla., and two years later was appointed district passenger agent of the Louisville & Nashville at Atlanta, Ga. He was subsequently division passenger agent at the latter place until 1907, when he was made general agent of the passenger department of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, with headquarters at Cincinnati, Ohio. He remained in that position for 18 months and was then promoted to assistant general passenger agent at Little Rock, Ark., which position he held on January 1st, when he was appointed general passenger agent, with headquarters at St. Louis, Mo.

J. G. HOLLENBECK.

Frederic A. Miller.

FREDERIC A. MILLER, general passenger agent of the Chicago, Milwaukee & St. Paul, has been appointed passenger traffic manager, with headquarters at Chicago, effective January 15th. Mr. Miller was born April 10, 1858, at Harford, Pa., and began railway work in August, 1874, with the Cairo & Vincennes, now a part of the Cleveland, Cincinnati, Chicago & St. Louis, filling the positions of cashier and ticket seller at Cairo, Ill., and freight and ticket agent and clerk in the general freight and passenger office until 1878, when he was made general passenger agent of that road. He resigned in 1882, and for one year was union ticket agent of the Wabash, St. Louis & Pacific, the St. Louis, Iron Mountain & Southern, and

Digitized by Google

F. A. MILLER.

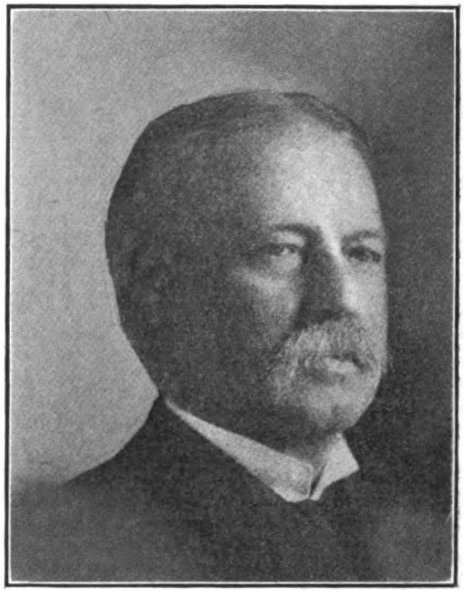
the Mobile & Ohio at Cairo. Mr. Miller then went to the Chicago, Milwaukee & St. Paul as clerk in the general passenger department. Two years later he was made general agent at Chicago, and from 1887 to October, 1900, he was assistant general passenger agent. He was then appointed general passenger agent, and now becomes passenger traffic manager, having completed thirty years of service with the St. Paul road.

James Roberts Wood.

JAMES R. WOOD, who until his recent retirement, was passenger traffic manager of the Pennsylvania Railroad, was born in Auburn, N. Y., February 9, 1843. He commenced his railroad career in 1869, as secretary to the superintendent of the Burlington and Missouri River Railroad, at Creston, Iowa. From this post he was advanced to the position of trainmaster, which he held until 1871, when he was appointed general western passenger agent of the same road, with office at Chicago.

JAMES R. WOOD.

In 1873 Mr. Wood became general ticket agent of the Burlington and Missouri River Railroad in Nebraska, and subsequently Western land and passenger agent. After a short service in this capacity he was appointed general agent of the Michigan Central and Chicago and West Michigan Railroads, at Grand Rapids, Mich., and in 1876 assistant superintendent of the same Company, at Jackson, Mich. In 1878, Mr. Wood returned to Chicago as assistant general passenger agent of the Michigan Central Railroad, for a few months only, returning to the Chicago, Burlington and Quincy Railroad as general passenger agent of that system. He continued in this position until April, 1881, when he received the appointment of general passenger agent of the Pennsylvania Railroad, which position he filled until his appointment as passenger traffic manager, on June 1, 1903.



E. H. FITZHUGH.

E. H. Fitzhugh.

E. H. FITZHUGH, president of the Central Vermont, resigned that position on January 23d, and also resigned from the Board of Directors. Mr. Fitzhugh was born February 1, 1853, at Danville, Montgomery County, Mo. He began railway work in 1873 as a clerk in the office of the master car builder of the St. Louis, Kansas City & Northern, now a part of the Wabash, at St. Louis. After serving in the car accountant's office of the same company he was made chief clerk to the superintendent of the Western Division of the Wabash, remaining in that position until 1889 when he became master of transportation for the lines west of the Mississippi River on the Wabash at Moberly. In January, 1896, he was appointed secretary to the general manager of the Grand Trunk at Montreal, Que., and the following July was made superintendent of the Middle Division at Toronto, Ont. From May, 1899, to March, 1901, he was vice-president and general man-

Digitized by Google

ager of the Central Vermont. He was appointed assistant to the president of the Southern Pacific in May, 1901, at San Francisco, Cal., remaining in that position until November of the same year. The following February he returned to the Central Vermont as vice-president and general manager, and on January 1, 1905, was elected third vice-president of the Grand Trunk, and also retained his office of vice-president of the Central Vermont. In January, 1910, he was elected first vice-president of the Grand Trunk, retaining also the vice-presidency of the Central Vermont, as well as the vice-presidency of the Detroit & Toledo Short Line. In the latter part of 1911, he was elected president of the Central Vermont Railway, the Central Vermont Transportation Company, the Southern New England Railroad Corporation, the Southern New England Railway and the Montreal & Southern Counties Railway, at which time he relinquished his duties in connection with his former position to devote his time to the companies named. Mr. Fitzhugh was the chief coadjutor of the late Charles M. Hays in the extension of the Grand Trunk system into New England; and, as will be seen from the foregoing, he had been associated with Mr. Hays throughout his railroad career.

Financial

Downward Drift in Security Prices.

THE month in the financial and money markets has been remarkable for a steady downward drift of security prices. In spite of continued ease in money, evidenced by low rates for call loans, the values of the principal railroad and industrial stocks moved steadily downward. Several prominent railroad stocks, including Atchison, Erie, New York Central, Pennsylvania, Norfolk & Western and Southern Pacific, has sold below the lowest prices recorded in 1912. A significant feature of the situation, which has caused not a little uneasiness, has been the rapid decline in the preferred stocks of certain industrial corporations recently issued. In the week ending February 21st, for example, the preferred stock of the Goodrich Company dclined 14¾ points, Woolworth preferred stock, at the lowest, showed a loss of nearly 12 points, and Studebaker of 5⅜ points.

In spite of this gloomy situation in the stock market, the general position of the country continues to improve. The January totals of exports and imports show large expansion, and it is especially noteworthy that the increase in exports was mainly in the class of manufactures and merchandise. The aggregate merchandise exports for January were $237,000,000 compared with $202,000,000 last year. Merchandise imports for January have also reached high figures, standing at $162,000,000, a monthly total exceeded only once in our history. The net result of seven months foreign trade is a credit balance, so far as the figures of exports and imports go, of $430,000,000.

Building Operations.

BUILDING operations throughout the United States, an excellent indication of the soundness of the business situation, continue very active, the total estimated outlay reaching $55,000,000 as compared with $48,000,000 last year. The commercial failures exhibit for the month of January is more favorable than a year ago. Messrs. R. G. Dun & Co's. compilation of commercial failures for January, 1913, shows 1814 failures with indebtedness of $22,972,000, against 1897 with liabilities of $19,770,000 in 1912. The increase in liabilities was due to the unusual amounts involved in a few failures.

Railroad Traffic and Earnings.

RAILROAD traffic and earnings continue to show small increases. Reports from the steel trade are also encouraging, orders being received on a greater scale in February than January. The settlement of the firemen's strike already noted on another page, removed a depressing influence. It should not be forgotten, however, that the ever-recurring controversy between railroads and their employees has not been settled, and that the successive victories won by organized labor in this field, as a result of their employment of the methods of compromise through arbitration, is bringing more and more strongly to the front the necessity of reaching some permanent basis for adjusting these differences which shall remove this perennial cause of disquiet and disturbance.

The European Situation.

THE foreign situation is not encouraging. The Balkan War drags its way along and the prospects of settlement are not, at this writing, bright. The United States is affected by this situation because of the continued drain of gold into the European banks and the general hoarding throughout Europe by way of provision against possible trouble. In France, Germany and Austria, hundreds of millions of gold has been hoarded which will not be released until the situation in southeastern Europe has been definitely cleared up. This makes for higher money rates and is responsible for the exportation of gold from the United States which has recently been in progress.

The Mexican Situation.

THE Mexican situation does not, apparently, cause much uneasiness. It is believed that with the return of representatives of the Diaz regime to power, the wide-spread brigandage which is now perilizing business activity throughout Mexico will soon disappear, and the reign of law and order, even though secured under a military despotism will be re-established. The events of the last two years have proven that the Mexican people have no conception of liberty as that word is understood in the United States. Liberty with them, under a mild central government, means license to pillage and destroy. The re-establishment of the military regime, will, it is believed, secure peace in Mexico for many years to come.

Corporate Financing During January.

IN spite of the unfavorable outlook in the securities market, corporate financing in the United States during the month of January reached the record total of $355,000,000. In but three months of last year did the total

Digitized by Google

financing go beyond $200,000,000. This is extraordinary, in view of the fact that the prices of securities are about at the lowest figure reached since the 1907 and 1908 depression. The railroads are responsible for the increase. Out of the $355,000,000 total financing for the month the railroads did nearly $200,000,000 using a 4½ per cent bond or a higher yield bond, note or stock.

Bond Prices.

BOND prices have not generally continued the advances which began with the outset of the year in response to lower money rates. The average price of 25 bonds is now ½ a point above the closing price for December. The average for January, 1913, on the basis of the figures compiled by the Wall Street Journal, was 89.1. In January, 1912, the average was 90.9; in 1911, 91.4; in 1910, 92.8; and in 1909, 93.7. Declines during the past year have been general in the very best class of bonds. Atchison General 4s, for example, declined 1¼ points; Northern Pacific 4s, 2⅛; Reading General 4s, 1⅛; Southern Pacific Refunding 4s, 2; Union Pacific First 4s, 1¾. Low grade bonds are much depressed, although they are selling above their low prices for 1912. Chicago & Alton First Lien 3½s, for example, have advanced 2¾ points from the low point of 1912. Denver & Rio Grande First and Refunding 5s, 2¾; Seaboard Adjustment 5s, 2¼; Missouri Pacific First and Refunding Convertible 5s, 3¼. At present prices the yields on most of these bonds ranges from 6 to 7 per cent.

The Attitude of the English Investor.

THE attitude of the English investor towards our railroad securities is significant. Treating of our railroad bonds the "Financial Times" of London, explains the decline since 1907, in the face of the fact that the security of nearly all bonds has improved on the basis of the earning power of the properties which secure them, by the general advance in the rate of interest all over the world, and it points out that the advance in interest rates due to the growing pressure upon the money supply still continues. This authority also finds a local cause for the depression in bonds in the proceedings of the Pujo Committee. Upon this the following comment is made: "If restrictive legislation is to be proposed as the outcome of this inquiry, it would be extremely hazardous to guess at this juncture the lines upon which it could be framed, but there is a growing notion that something definite of the sort is projected and the effect upon markets is depressing. In this depression even the best bonds share, and the best bonds are, of course, the securities which in the long run have nothing whatever to fear from the outcome."

Recent Large Offering.

IN spite of certain pessimistic conclusions as to the future of the bond market, the railroads, as just remarked, are coming into the market with large offerings. The Seaboard Air Line Railway has sold $6,000,000 three year collateral 5 per cent notes, which will increase its interest charges $300,000 a year. Last year's surplus over all charges was $899,266, and for the first six months of this year net operating income, after taxes, increased $113,000. The interest obligation on these new securities will be earned three times over. It has been two years since this company has done any financing except for the purchase of new equipment. The present issues are secured by the refunding 4 per cent bonds of 1959. These bonds are not offered directly, since their price has declined 5 points since they were first brought out. The Seaboard is making steady progress toward a sound position but it will be several years before it will be in a position to pay any dividends on its stock.

The Boston & Maine has sold an issue of $10,000,000, 5 per cent one year notes dated February 3d, which are offered to the public on a basis of 4¾ per cent. Of the proceeds of the new notes about $5,000,000 will be used to take up the company's share of the new Maine Central's stock, and the balance to take up maturing note issues. The company is now fully prepared to take up the $12,000,000 of 4 per cent notes sold last June.

The financial plans of the Baltimore & Ohio are likely to be delayed by legal proceedings to determine whether the Public Service Commission of that State has authority over the security issues of the railroads. The railroad company claims freedom from the Commission's control by virtue of special privileges contained in its charter of 1827, while the Commission insists that the Baltimore & Ohio must ask authorization for security issues like any other public service corporation. Involved in the question is the possibility to set aside the tax exemption which the Baltimore & Ohio enjoys in the State of Maryland, and which has been estimated to be worth $500,000 annually to the company. An amendment to the State Constitution adopted in 1890, provides that any corporation enjoying exemption from taxes which avails itself of any favor from the State through general or special laws shall forfeit the tax exemption. The question has been raised by the underwriting bankers, who have formed a syndicate to take the bond issue, and who have been advised by counsel to have the matter of the legal status of these bonds definitely cleared up. It is expected that the matter will be forced to an immediate issue.

The Norfolk & Western has announced an issue of $19,000,000, 20 year 4½ per cent convertible bonds. These will be offered to stockholders of record as of February 17th, who will be allowed to subscribe to the new bonds to the extent of 15 per cent of their stock holdings at a price of 102½. The new bonds will be convertible into common stock at par, at any time between September 1, 1913, and September 1, 1923.

An interesting feature connected with these convertible bonds, of which six large issues have been announced since the first of the year, is the sharp decline in the value of the related stocks, notwithstanding that in four cases the "right" of small value attached to the subscription. American Telephone stock has declined 5⅜; St. Paul, 2; Baltimore & Ohio, 1⅞; Norfolk & Western, 3¼, and M. Rumely 9½ per cent.

Digitized by Google

The explanation of this decline is found in the fact that these issues were, without exception, offered to stockholders and the effort to secure $178,500,000 in this manner naturally exercised a depressing influence upon the stock.

Effect of Dissolution Upon Southern Pacific.

THE "Chronicle" of February 22d, contains an interesting analysis of the effect of the dissolution order upon the Southern Pacific, which is of especial importance in view of the sharp decline in the value of **Southern** Pacific stock. The Southern Pacific will lose the income represented by the Central Pacific dividends, and in return, will receive $104,189,941. The question to be answered in determining the effect of the separation upon the Southern Pacific is whether this money will result in an income return equal to the return now received on these shares. The "Chronicle" does not believe that the Southern Pacific will lose anything by the exchange. The total return on Central Pacific stock is now $4,728,530. If the money received in exchange for this stock is employed to return 4½ per cent to the Southern Pacific, the yield will equal the amount of the loss from giving up the dividend. It is reasonably certain that the returns of the Southern Pacific from the employment of this money will far exceed 4½ per cent. Practically, the entire surplus of the Central Pacific, over expenses and fixed charges, was paid to the Southern Pacific as dividends. An interesting point, noted by the "Chronicle," is the fact that the payment of this immense sum of money to the Southern Pacific will relieve that company of the necessity of new financing for a long time to come.

Railway Earnings.

THE number of statements of railroad earnings which have been made is so large that space does not suffice for more than a summary of each report.

Atchison, Topeka & Santa Fe.—After providing for the six months' dividends on the common stock, the company earned $4,500,000 estimated surplus.

Central Railroad of New Jersey.—This company has earned a balance for dividends of $4,704,256 in the first half of the current fiscal year. It is the largest in the company's history, exceeding 1912, the next highest year, by $689,200. This surplus is $1,400,000 above the dividend requirements for the full year.

Chicago & Alton.—For the six months ending December 31st, the Alton showed a deficit after all charges, of approximately $73,700. This showing is primarily due to heavier maintenance expenses which have resulted in marked improvement in the property.

Chesapeake & Ohio.—This company showed a moderate increase in gross earnings for the first six months, but a reduction in net operating income of $200,000 due to higher operating expenses and taxes.

Chicago & Northwestern.—In the last fiscal year the company earned 7.5 per cent on its common stock. In six months of the current year it has earned 6.4 per cent on the common stock over the half year's fixed charges and preferred dividend requirement.

Chicago, Milwaukee & St. Paul.—During the first half of the current fiscal year the combined income accounts of the St. Paul and the Puget Sound roads showed estimated earnings of 7.25 per cent on St. Paul's common stock, about five times the amount reported as earned on the common for the entire year ending June 30, 1912.

Delaware & Hudson.—This company earned about 12 per cent on its $42,500,000 of stock. This was a slight reduction from the preceding year, explained by the losses due to the cessation of mining operations and to the increase in maintenance charges.

Denver & Rio Grande.—The net earnings of the Denver & Rio Grande for the six months ending December 31st, increased $812,000 over the corresponding period of 1911.

Great Western.—Net earnings for the six months ending December 31st show a gain of $239,378 which is 13½ per cent increase. The total indicated surplus for the six months is $885,900 over fixed charges and taxes.

Illinois Central.—As a result of considerable savings in operating expenses, the Illinois Central was able to show an increase of $933,251 in its surplus over dividend requirements. Last year the company showed a deficit of $931,494, and this year a surplus of $1,757.

Kansas City Southern.—This company shows a gain of $480,000 for the six months period ending December 31st, over operating expenses and taxes.

Lackawanna & Western.—The Delaware, Lackawanna & Western Railroad Company shows a surplus available for dividends for 1912 of about $832,000 less than in 1911. The company has, however, earned approximately 36 per cent on its stock.

Lehigh Valley.—For the six months, this company shows a gain in net earnings of $1,132,532 or more than 18 per cent.

Louisville & Nashville.—This company shows a decline in net earnings for the six months ending December 31st of $709,000, explained by increases in maintenance expenses which were relatively larger than those of any large company.

Minneapolis & St. Louis R. R. Co.—The operations for the fiscal year ending June 30, 1912, show a deficit of $667,041, a decrease of $726,897 from 1911.

Missouri Pacific.—For the first six months of the current fiscal year, Missouri Pacific has made the remarkable gain of $2,509,032 in the surplus available for dividends.

New York Central and Affiliated Lines.—For 1912 the total New York Central system shows a gain of $7,223,746. The net earnings of the New York Central Railroad proper, show a small decrease.

Pennsylvania.—The Pennsylvania Railroad system, including all lines East and West of Pittsburgh, shows a gain of $6,690,906 in net operating revenue.

Digitized by Google

Norfolk & Western.—The Norfolk and Western in six months ending December 31, 1912, showed a net income of $6,083,069, a gain of $1,100,937 over the corresponding period of 1911.

Northern Pacific.—Northern Pacific shows for the first six months of the current fiscal year, an increase in net operating income of $1,945,413.

Reading.—In the first half of the current fiscal year, Reading earned 9.7 per cent on the common stock, after providing for the full year's dividend on the first and second preferred. In the same period a year ago, 2.6 per cent was earned.

Rock Island.—The Chicago, Rock Island & Pacific Railway Company increased nearly $1,000,000 in its balance available for dividends.

Seaboard Air Line.—Seaboard Air Line, for the six months ending December 31st, shows an increase in net earnings from operation of $113,178.

St. Louis, Iron Mountain & Southern.—The St. Louis, Iron Mountain & Southern surplus over charges, for the six months ending December 31st, increased $682,719 or 87 per cent. This was done after spending $643,000 more upon maintenance and allowing for an increase of $193,000 in fixed charges and taxes.

Wabash, Pittsburgh Terminal.—Six months' earnings of the Wabash & Pittsburgh Terminal were only $65 965 over operating expenses.

Fifty-eighth Annual Report of the Northern Central Railway Company.

THE past year showed little change over 1911 in the results achieved by the Northern Central. The gross operating revenues for the year showed an increase of $98,894, chiefly in the passenger traffic. The freight revenue decreased $60,665. This was explained by the suspension of anthracite coal mining operations in the spring of 1912 and further by the fact that connecting lines, from which the company derives a large tonnage, established Newberry Junction and Wilkes-Barre as interchange points instead of continuing to use the Elmira and Canandaigua gateways. This resulted in a considerable reduction in tonnage and in the length of haul. The company was able to offset these losses in large part by making substantial increases in the merchandise and general freight traffic but the smaller train loads and faster movement required for this class of traffic increased the operating expenses.

The principal increase in operating expenses was in maintenance of equipment whose cost was $97,796 greater than in 1911. The new income for the year was $1,825,433 a decrease of $30,635 as compared with 1911. Of this amount, after paying the regular 8 per cent dividends and the contributions to the various sinking and reserve funds, a balance of $250,688 was transferred to the "Reserve for Additions and Betterments."

President Samuel Rea, who succeeded President McCrea in charge of the Northern Central, in connection with the statement that the expenditures for construction, equipment and real estate aggregated $685,632, stated that it would be necessary to further improve and enlarge the tracks for facilities for local and through traffic in Baltimore.

But little progress has been made in the litigation which has interfered with the consummation of the lease of the company's property to the Pennsylvania Railroad Company. Various actions have been begun and some of these are still pending while others have been abandoned. It is possible that an outcome of this litigation unfavorable to the company may make it necessary to reconsider the provisions of the proposed lease.

Colonel Goethals Honored by New York Engineers.—On January 27th, the eve of his return to Panama, Col. George W. Goethals, chief engineer of the Panama Canal, was the guest of honor at a dinner given in the Hotel Astor by the Lehigh University Club of Greater New York.

More than four hundred engineers, scientists, and men of affairs of New York City and vicinity were present. The speakers were Dr. Henry Sturgis Drinker, president of Lehigh University; Col. Goethals, Rear-Admiral R. E. Peary, John Hays Hammond, and Ira A. Place, vice-president of the New York Central Railroad.

A letter from President Taft was read by Dr. Drinker, in which the President expressed regret at being unable to attend the dinner, paid tribute to the work of Col. Goethals at Panama, and referred to his recommendation to Congress, "that Col. Goethals receive as a reward for his services the rank and pay of a major-general in the army."

In his address of welcome in behalf of the Lehigh University Club of Greater New York, Dr. Drinker briefly reviewed the tremendous task which has been so successfully accomplished under the supervision of Colonel Goethals and paid a glowing tribute to all those identified with the work. He said:

"The Panama Canal signalizes the success of a great engineer, supported by most able and devoted men, who have shown the world in this twentieth century a triumph of engineering skill and of scientific management over difficulties that appeared to be insuperable."

Among the guests of the Lehigh Club at the banquet were: Rear-Admiral R. E. Peary, John Hays Hammond, J. A. Bensel, Ira A. Place, vice-president New York Central and Hudson River R. R. Co.; James Gayley, of the United States Steel Corporation; J. J. Carty, chief engineer American Telephone and Telegraph Co.; Nelson P. Lewis, chief engineer New York City Board of Estimate; Prof. Frank P. McKibben, head of the Civil Engineering Department, Lehigh University; Dr. Mansfield Merriman, formerly Professor of Civil Engineering at Lehigh; Alfred Noble, Consulting Engineer; Wm. H. Hulick, president Lafayette College Club of New York; J. Waldo Smith, Engineer New York Board of Water Supply; Wm. R. Willcox, chairman New York Public Service Commission; President A. C. Humphreys, of Stevens Institute of Technology; the Trustees and Faculty of Lehigh University.

Operation

The Crusade for Greater Safety.

"SAFETY FIRST" continues to be the most interesting and noteworthy movement in the field of railway operation. This tremendous crusade, limitless in its possibilities, which was inaugurated some two years ago has spread to practically every important system in the country and is being exemplified in countless innovations. The work of promoting safety, which was necessarily experimental in the beginning, is now being rapidly reduced to system and order and is being carried on with the precision and effectiveness of the older forms of railway work. One of the most notable features of the month has been the appearance of safety magazines or booklets on a number of important systems, copies of which are circulated not only among the employes of the issuing company, but among a considerable number outside of railway circles.

New York Central's Safety Campaign.

ONE of the most effective and interesting of these special publications is *"Safety,* a periodical of progress and protection," issued by the New York Central Lines Safety Committee. It is intended that this publication shall appear monthly. Every employe who could read English received a copy of this magazine, which is attractively gotten up and contains a number of interesting illustrations, two of which are herewith reproduced. The magazine is written in a snappy and interesting style, so as to preserve the interest of the reader, and the advice which is given is put forth in such a way as to make it stick in the mind. Railway officials will watch with interest the effect of this publication.

The New York Central System now has sixty safety committees, consisting of about 900 members, at work on this problem. About 500 new items on an average are taken up for consideration each month. The Safety Department has asked each member of the several committees within thirty days to do three things—first, explain to at least three men in his own branch of the service the purpose of the safety movement; second, to impress upon them the importance of the safety rules and regulations; to call their attention to the unnecessary risks which are taken by men in their branch of the service and the possible consequences which arise therefrom, and third, to get each of them to promise that he will in turn talk to three other men along the same lines.

Safety Work on the Pennsylvania.

THE Pennsylvania lines have likewise prepared a booklet which will shortly be distributed to their 85,000 employes, designed to lead to greater care in the performance of daily tasks. The booklet is filled with suggestions of the methods by which each employe can best look out for his own safety and can guard the safety of his fellow employes. The men are urged not only to exercise care themselves, but to warn others of danger "and to discourage acts of recklessness on the part of those who, by reason of their inexperience or their familiarity with their work, fail to take proper precautions for the safety of themselves, their fellow employes or the traveling public."

Safety rallies have been held during the last month at a number of points on this system. A large rally at which over 500 employes were present was held in the Auditorium at the Pennsylvania Terminal in New York City. A number of stereopticon views were shown to illustrate the right and wrong way of performing ordinary duties and to show some of the needless dangers which are daily run by employes. Another large rally was held in the Lyric Theatre at Baltimore, to which employes and officials of the various roads operating in Maryland were invited. A number of special trains were run over the various divisions of the Pennsylvania to bring to Baltimore the employes who desired to attend. Five-minute addresses were made by representatives of each branch of the service on various practical matters connected with the movement, and as a concluding feature a stereopticon exhibition was given, illustrating some of the important rules of the company.

Particular attention is being paid to the problem of trespassing on the lines of this system. The reports of accidents to trespassers are being

AN UNSAFE WAY OF UNCOUPLING AIR BRAKE HOSE—HEAD BETWEEN PLATFORMS.

A SAFE WAY OF UNCOUPLING AIR BRAKE HOSE—HEAD CLEAR OF PLATFORMS.

carefully scrutinized and every effort is being used to impress upon the communities scattered along the lines the importance of avoiding railway tracks.

Improvements in Signal System to Increase Safety.

AS a feature of its "safety first" movement the Pennsylvania has directed attention to the problem of preventing mistaken readings of signals by locomotive engineers through confusion arising from other lights too near the signals. Wooden or metal shields, painted an appropriate color to bring out the semaphore arms in the daytime, are being placed at various points where the background is of such a color as to make signals indistinct. In the same way lights on the railway right-of-way, or on adjacent buildings, public roads or bridges either in the near vicinity of signals or which get in the line of vision of engineers endeavoring to read signals are either being removed or provided with shields so as to eliminate the possibility of error. In addition at some points, as for example, Lewistown Junction, Pa., small signal lights have been attached directly underneath the main signal which will show "red" at all times, thus making it possible for the engineer to pick out the proper "white" light in case the track is clear.

Preventing Children from Playing About Cars.

ACCORDING to Mr. N. L. Howard, of the Burlington System, one of the greatest sources of injury on railroads is the carelessness of parents and the tolerance of railway officials in allowing children to play about standing cars on sidings and in yards; "to-day some where in this country two or three little children have been killed playing around tracks or cars, so it was yesterday; so it will be to-morrow, and so it averages, day in and day out through all the year. All that we railroad men can do about it, however, is very little; children continue to come every day to our yards to play * * * * too often to meet with disaster because it is impossible for us to keep an eye on every one of them or keep them away. It is bad enough to run over grown up trespassers, but cannot something be done to stop killing children?"

That Mr. Howard does not overstate the condition is beyond dispute. The California Railroad Commission, for example, points out in its accident report that twenty per cent of those killed within that State were children who were crushed under the wheels while playing on the tracks. While it is possible that this percentage is higher than in some States yet the compilation is most significant. THE RAILWAY WORLD suggests to railway managers that they can with profit extend their safety work to the public schools, as has already been done by the street railways. A forceful exhibition of moving pictures and stereopticon slides will have a powerful effect upon the impressionable minds of children and will furnish perhaps the best method of educating the public at large within the space of a few years to the importance of avoiding railway property.

Thoughtlessness as the Breeder of Accidents.

"SEVENTY per cent of accidents are avoidable and are generally caused by thoughtlessness," is the conclusion of Mr. S. W. Atkins, claim agent of the Boston and Maine Railroad. Thoughtlessness is daily apparent, as he points out, among the employes in every branch of the service, among shippers, the traveling public and the people who reside along the lines; in fact every class in the community is affected by it. "My investigation of these accidents leads me to conclude that railroad men are not thinking about them, but are rather trying to keep them out of their minds as something unpleasant to think

Digitized by Google

about; consequently are giving little or no thought to the prevention of accidents. * * * * I fear the attitude of the railroad man of to-day is to take a chance. He many times gets by but the time comes when he does not. I find men coupling up air hose where cars are being kicked on to the train, stepping on the pilot of the engine when the engine is coming toward them, using a broken knuckle rather than take the time to put in a new one, riding on side ladders, pushing the draw bar over with their feet when the cars are almost together; jumping from a moving train to cars that are standing on a side track, and doing so many desperately careless and foolish things that I would be ashamed to mention them were they not occurring over and over again and resulting in most serious accidents."

Safety Work on the Erie.

ONE of the interesting developments in promoting safety is the recent order of the Erie Railroad Company calling attention to the occasional but very dangerous laxity which has grown up in the flagging of trains. The company points out that "the man who flags trains is a protector of human life and property if he flags conscientiously; he becomes a protector only when he goes back a sufficient distance. Standing near the rear end of a halted train with a flag or lantern in hand is not flagging; it is criminal negligence and the company regards it in no other light. Obey the rules to the letter * * * * never mind about the engineer's whistle calling you in. If you get left it is of less importance than if you caught the train and disobeyed the rules."

Safety Work on Mobile and Ohio.

THE Mobile and Ohio has recently inaugurated an extensive safety campaign. In addition to organizing the conventional committees the principal officers of the company, including the vice-president, the general manager, the general superintendent, the general counsel and the chief surgeon, have visited each point of importance and discussed with employes questions connected with safety in operation.

Santa Fe's Moving Picture Demonstration.

MR. ISAIAH HALE, Safety Commissioner of the Santa Fe System, has completed plans for free entertainments for employes of the company which will include moving pictures, music and talks on "Safety First." The moving pictures will show how wrecks and accidents in shops and yards occur as results of carelessness. The company realizes that the effect of these pictures will depend on the care exercised in their selection and preparation. Efforts are being made to procure typical illustrations of mistakes, and to show clearly not only the "wrong way," but what is more important, the "right way" in which a particular piece of work should be handled. It is planned to make the pictures the ground work for the "safety" talk.

Home Conditions of Employees and the Safety Problem.

THE New Haven System has called the attention of its employes to the effect of home conditions upon the probability of accident to railway men. It is pointed out that a man who in going to work slams his home door behind him in anger is in no fit frame of mind to run an engine or operate a signal tower. This is one of the first instances of the recognition of the psychological aspects of the safety problem which can be very much further developed with profit.

President Miller Drafts Trespass Law.

PRESIDENT DARIUS MILLER, of the Burlington System, has prepared a draft of a proposed law to prohibit trespassing on railroads at the request of the California State authorities which is to be submitted to the governors, legislatures and railroad commissions of the various States in which this system operates. The penalty provided for trespassing in the proposed law is a fine of not less than $10 nor more than $100, or imprisonment in jail for a term of thirty days, or both at the discretion of the court.

President Mellen to Confer with Employees Every Month.

PRESIDENT MELLEN, of the New Haven System, announces that he will meet the representatives of the men once a month "to devote a day to them if need be, to receive their suggestions, the results of their observations, and to profit by them I hope to our mutual advantage. I can ill spare the time, but I know of no better use for it. I believe there must be better co-operation on the part of officials and labor organizations, or the results will be worse for both. I am earnestly desirous of promoting that closer co-operation by all means in my power."

Safety Work on the Baltimore and Ohio.

ALMOST interesting account of the scope and method of safety work on the Baltimore and Ohio System was given by Mr. J. W. Koon in a paper read before the New York Railroad Club at its regular meeting on February 21st. Mr. Koon described the general organization of the work on that system, and the manner in which the work is conducted. He analyzed the various causes of train accidents on his system and showed what was being done in each direction to reduce or eliminate these accidents. An interesting feature of the work, as described by him, are the "observation tests"—sometimes improperly called "surprise tests." * * * "Each division is required to make not less than a given number of tests. For example, a clearance card is made to show the wrong engine number or incorrect date to see if the crew are alert and detect these errors. A train order is improperly repeated to see if the dispatcher or operator is vigilant. A signal light is removed or a signal improperly displayed to see if the rules requiring trains to stop under those circumstances are observed. These are not "surprise tests"; they are limited to conditions met with every day and no "catch" features are permitted or anything that endangers life or limb, but they enable one to locate the careless man *before* an accident occurs. * * * * The value of these tests cannot be overestimated. In fact I would advocate the appointment of one or more men thoroughly familiar with railroad operation whose business it would be to see that these tests were properly made, proper record kept and failures followed

Digitized by Google

up. Let the inspector get on a freight train and ask the brakeman under what orders he is running to see if he goes over the train orders and is fully informed. Let him examine the lanterns to see if torpedoes are attached, that they are clean and ready for instant use. Let him talk to the men as to what constitutes proper flagging, etc."

Mr. Koon pointed out with great pride that not a passenger has been killed on the Baltimore and Ohio System in a train accident in the last five years, during which time over 85,000,000 people have been carried. He stated that the real problem was to get the employes to be as careful of themselves as they were of their passengers.

The Accident Roll.

FORTUNATELY it is not necessary to chronicle many accidents during the month—in fact judging only from the standpoint of those accidents which resulted in loss of life, the month was singularly free from such losses.

The most serious accident was that which occurred on the Illinois Central, near Melvin Station in Ford County, Illinois. While a limited train was running at forty miles an hour speed five steel coaches of the train jumped the track, three of which rolled down an embankment. The accident was presumably due to the breaking of a rail. Twenty-six persons were injured but none were killed; among the injured were a number of prominent members of the Illinois Legislature.

The Buffalo Flyer on the Pennsylvania Railroad was derailed on January 17th near Lock Haven, Pa. A boulder which had rolled down the mountain side and which was not observed by the engineeer in time to stop, ditched the entire train except the rear sleeper—the baggage car, steel combination car and a steel day coach were turned over and rolled down an embankment. One of the sleepers was derailed but remained upright. It is remarkable that the seriously injured was confined to the express messenger; there was a considerable number of passengers in the day coach.

Another accident of the month occurred on the Michigan Central lines in Chicago on February 1st. The accident was caused by a switch engine which ran past danger signals onto a main track upon which the "American Express" was approaching. The collision demolished both locomotives, injuring the engineers and firemen of each. No injury to passengers resulted.

Accidents in 1912.

VARIOUS State commissions have, during the past month, issued their annnal compilation of accidents occurring within their respective jurisdictions during the year 1012. The Up-State Commission of New York reports that 871 persons were killed and 4,340 were injured on the steam roads of the State during the year ended June 30, last. Three persons were killed and forty injured by accidents of various kinds to locomotive boilers. The Commission comments upon the fact that there have been no boiler explosions in the State during the five years during which the Commission has had jurisdiction over locomotive boilers; this record is considered remarkable in view of the fact that there are over 6,000 constantly in use within the State.

According to the Pennsylvania State Railroad Commission, 1,179 persons were killed and 11,300 were injured on steam railroads in the calendar year 1912. These figures indicate an increase of 65 in the number killed and 2,585 in the number injured over the preceding year. Of those killed in 1912, 452 were employes, 28 passengers, and 583 trespassers. The number of grade crossing fatalities was 101, with 257 injuries. Of the total number of persons injured within the State last year over 80 per cent were employes.

In Oklahoma during the fiscal year ending June 30th, last, 113 persons were killed and 1,102 injured on steam railroads. Of the total number of fatalities in this period only four were represented by passengers.

Increasing Freight Car Efficiency.

MR. ARTHUR HALE, general agent of the American Railway Association, in a report to Chairman Lane, of the Interstate Commerce Commission, made public February 8th, declared that the increased efficiency in the handling of freight cars which had occurred during the last six months has been "equivalent to an addition of more than 150,000 freight cars to the equipment of American railroads." The investment required to provide this number of cars would aggregate one hundred and twenty million dollars.

It is apparent that in spite of this encouraging showing railway managers are looking forward to a still greater increase in freight car efficiency. Mr. W. H. Williams, third vice-president of the Delaware and Hudson Company, has prepared and submitted to railway officers through out the United States for their criticism a plan which is intended to bring about economies in settling claims for the use of equipment between railroads. He proposes the establishment of a general clearing house to be known as "The American Railway Clearing House," and of a number of district clearing houses. Through the use of these clearing houses whose organization and operation is very similar to that of the bank clearing house, a large part of the expense and work incident to the settlement of interline freight, passenger, per diem expenses, car repairs, etc,, will be eliminated. Mr. Williams estimates that these items aggregate about $0,000,000 and call for approximately $40,-000,000 of checks, drafts and cash.

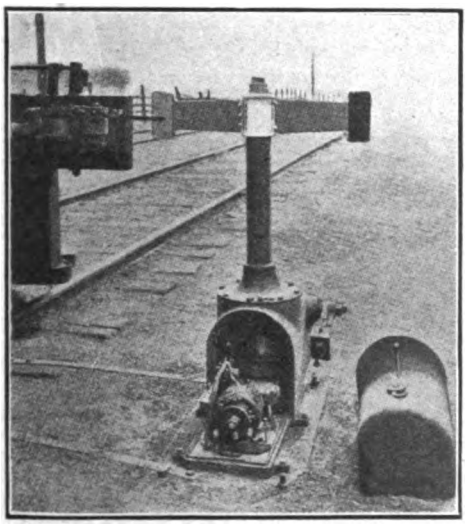
Mr. J. M. Daily, general superintendent of transportation of the Illinois Central, has suggested a more comprehensive plan than that outlined by Mr. Williams. He advocates the pooling of freight cars as the means of preventing empty movement and to obtain greater efficiency from equipment. He states that the recent increase in the per diem rate from 35 to 45 cents per day has stimulated the empty movement of cars which is a waste to the owners and to the country at large. The necessity for this practice would be eliminated by "car pooling." Mr. Daily believes that if the railroads had more cars they could not advantageously use them because of lack of terminal facilities. He declares that "car efficiency is dependent on terminal track facilities, ample team track and an adequate supply of locomotives to permit of prompt movement of the cars. It also depends on the co-operation of the shipper and the consignee in prompt loading and unloading. * * * * The records of the last three months on eighty per cent of the railroads showed that

Digitized by Google

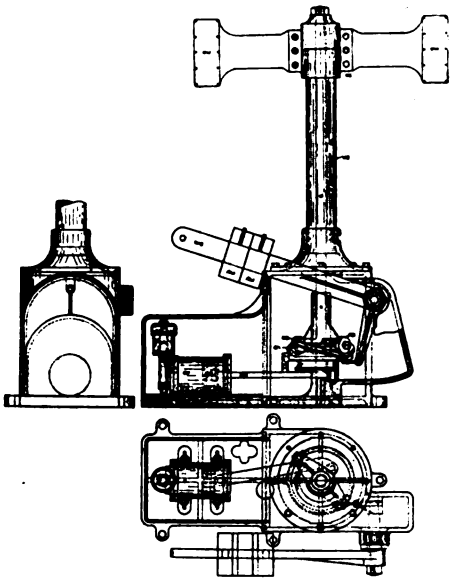
they had all the cars that could be handled to advantage either for want of additional yard and terminal tracks or for want of additional locomotives to move them. Had such railroads been able to obtain all the cars ordered as required for loading, it would have created a serious congestion, which would have resulted in the railroads moving less traffic than they did. It is necessary to provide facilities to promptly handle cars, then engines to move them, then shops and round houses to take care of the engines, and last to purchase the cars."

Report of Block Signal and Train Control Board.

THE final report of the block signal and train control board to the Interstate Commerce Commission, which has recently appeared, contains most interesting data concerning the results of the experiments conducted by this body. Since the organization of the Board in July, 1907, 11,046 devices and systems intended to promote the safety of railroad operation have been submitted for its consideration. It is interesting to note that as was to be expected, practically none of these devices have stood even the preliminary test and have therefore been discarded. In its final report, the Board states that there is nothing of importance to add to its previous report concerning the block signal problem. The greater portion of the final report is taken up with a discussion of the automatic train stop question. The report states, that at the time of the preparation of this report (June, 1912) there was in progress tests of the Gray-Thurber automatic train control system, on the Pennsylvania lines west, and the Jones Signal Company's device on the New York Central near Niagara Falls. The Board expressed the hope that tests of other devices will be undertaken in the near future by the same or other railroad systems, but considerable proportion of the report was taken up with the discussion of the rail-breakage problem, and the methods of improving track structure. The report states that the Board has devoted considerable time to the investigation of various designs of ties intended as substitutes for wooden ties. It is the opinion of the Board that both the steel tie and the concrete tie are questions for the future, and that much experimenting must be done before a satisfactory form can be evolved.



ELECTRIC MOTOR TRACK DEVICE, WITH COVER REMOVED AND WINGS IN STOP POSITION; CALHOUN ENGINE DEVICE, WITH ENGINE ARM IN CONTACT WITH TRACK DEVICE.



ELEVATION AND PLAN OF ELECTRIC PNEUMATIC TRACK DEVICE.

Perhaps the most interesting portion of the report is that dealing with the investigation of automatic train stops. The Board confines its discussion largely to two types of automatic control which have shown sufficient merit in preliminary tests to warrant, in the opinion of the Board, further consideration. The first of these devices is the Calhoun engine device, the general character of which is shown in the accompanying illustration. This device, it will be observed, has an automatic mechanical trip attached to the buffer-beams of the locomotive in such a manner that a spring contact arm, normally extended horizontally from the buffer-beam and at right angles with the track, is tripped by a vane of the track device, when a danger signal is set. The tripping of the contact arm applies the air brakes and brings the train to a stop. This device was given a series of successful tests on the Chesapeake Beach Railroad. The construction and operation of this device is described in detail in the report of the Board. The Board also describes in detail an electro-pneumatic track device, which is likewise shown in an accompanying illustration. It will be seen that this system might be worked with the Calhoun engine device or any similar method of automatic stop. Several types of electrical-pneumatic devices are discussed, all of which, however, are generally similar in character. None of these gave a perfect performance under all conditions in the preliminary tests.

The final conclusion of the Board, however, is

Digitized by Google

that the Calhoun engine device and some of the electric-pneumatic track devices "if properly assembled and operated comprise an automatic train stop system, possessing sufficient merit to warrant a thorough trial under service conditions."

Car Surplus Increases.

ON February 15th, according to the American Railway Association's compilation there was a net surplus of 22,183 freight cars, as compared with a surplus of 28,439 on January 15, a decrease of over 6,000 cars. The gross surplus of idle cars on February 15th was 52,700. The open winter, which has prevailed practically throughout the entire country, has been responsible to a considerable degree for this surplus. Last year, when the country was experiencing unusually heavy weather at this time, the movement of freight was exceedingly slow which materially shortened the car supply, the net surplus on February 14, standing at 13,958.

Operating Reorganization of Harriman's System.

ALTHOUGH the formal plan of dissolution recently proposed by the management of the Union and Southern Pacific has not been formally approved either by the Circuit Court sitting in St. Louis, by the California State Railroad Commission, or by the security holders of either system, the work of revising the operating organization of the two roads is receiving serious and careful attention. On February 1st the Southern Pacific Company gave up its joint office with the Union Pacific in St. Louis and established an independent office with a new working force in temporary quarters in the Wright Building. This is in line with the general plan of abolishing joint agencies of the two companies. By a general order issued on February 2d, exclusive agencies were established by the Southern Pacific Company in New York City, Boston, Baltimore, Buffalo, Philadelphia, Pittsburgh, Atlanta, Birmingham, Chicago, Cincinnati, St. Louis Detroit, Kansas City and Denver. At each agency a special representative has been appointed.

It is currently reported in the newspapers that in addition to taking over the Central Pacific, as has been suggested in the official plan for the segregation of the two companies, the Southern Pacific will also take over the Oregon-Washington Railroad and Navigation Company's properties between Portland and Puget Sound. If this report should prove to be true, it would result in the Southern Pacific securing terminals at Seattle and Tacoma. It is doubted, however, whether this step would be assented to by the Union Pacific interests.

First All-Steel Train Across Missouri.

THE Wabash Railroad Company inaugurated, on February 26th, a daily service in both directions between Chicago and Kansas City of a solid all-steel train. This is the first all-steel train to be regularly run across Missouri. The train is scheduled to leave Chicago at 9 A. M., arriving at Kansas City at 5.20 P. M., while the train in the opposite direction runs on approximately the same schedule. Five days previously the Wabash inaugurated a daily service in both directions by solid steel trains between St. Louis and Detroit. Each train is composed of five cars: mail, combination baggage and smoker, coach, sleeper and cafe-observation car. The schedule provides that a train shall leave St. Louis daily at 8.30 A. M., arriving at Detroit at 8.45 P. M. In the opposite direction the train leaves Detroit at 9 A. M. and arrives at St. Louis at 9.30 P. M.

New Train Auditing System on Western Lines.

ARRANGEMENTS are being perfected by the Santa Fe, Rock Island, Monon, Alton, and Wabash roads to install a train auditing system on the work of the conductors on their passenger trains which is similar to that in force at the present time on the North Western and Burlington lines. Under this plan auditors are empowered to enter trains at any point and compare the number of passengers on the train with the record of the conductor. Each auditor is required to furnish the conductor with a statement of his audit.

New Developments in Sanitary Car Cleaning.

THE Chicago and North Western Railway has recently created a new office under the title of Sanitary Inspector in charge of Dr. C. G. Elmore, who is aided by a number of assistants. It is the duty of this bureau to investigate the sanitary condition of coaches and chair cars, giving particular attention to cleanliness and disinfection. The sanitary inspector will also hold conferences at frequent intervals with the foreman of various coach yards to discuss methods of effecting improvements and economies. A circular letter has been issued by the inspector directing that at the final terminal of trains all refuse must be cleared out, particular attention being paid to accumulations under steam pipes and radiators. Cars must be thoroughly scrubbed and disinfected, the interior carefully dusted, windows washed, drinking water tanks cleaned, and the exterior either "dry-wiped" or scrubbed according to weather conditions.

In the Pennsylvania's yard at Sunny Side, Long Island, where the equipment entering the New York Terminal is stored, over 11,000 cars are cleaned every month, according to a recent statement. This does not include the cleaning of the cars used in the local work on Long Island. Since the opening of the Terminal and of the Sunny Side Yards, the cleaning yard at Jersey City has been largely abandoned.

American Association Report.—Efficiency of freight equipment on railroads of the United States and Canada, as reflected both in the number of miles making up the average distance traveled per car per day, and in ton miles per day, reached the highest point in October ever attained, so far as records kept by the American Railway Association show. This bears out predictions made some time ago that October, the month of heaviest traffic, probably would set a new high record for freight car performance, largely in consequence of the campaign waged throughout the latter part of 1912 for prompt loading and release of freight equipment to forestall threatened car shortages.

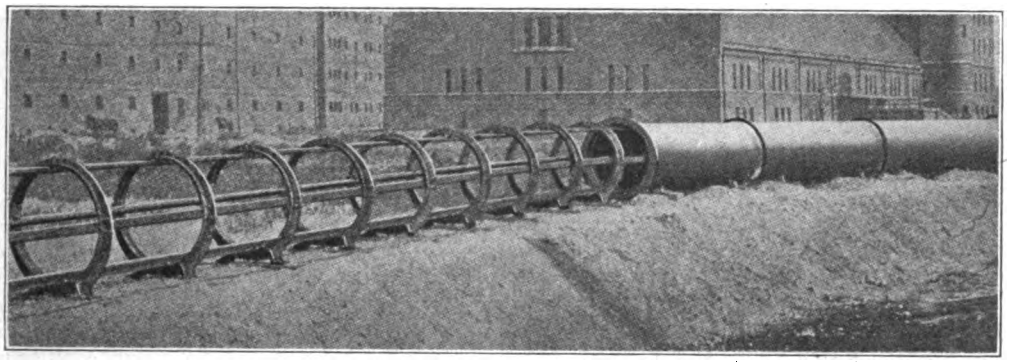
Mechanical

New Parcel Post Tunnel Railway.

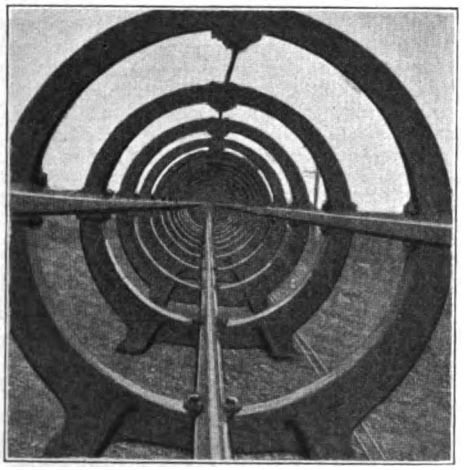
AN interesting development in connection with the recent inauguration of the parcel post, is an experimental installation at Cambridge, Mass., of a tunnel railway designed to demonstrate the possibilities of the rapid transportation of mail and parcels between railway terminals in large cities. The device is described in detail in a recent issue of *The Scientific American*.



Photograph from "Scientific American."

AN AUTOMATIC TUNNEL RAILWAY THAT CAN BE LAID UNDERGROUND OR ON THE SURFACE, IN WHICH CARS ARE PROPELLED BY ELECTRIC MOTORS, IN MUCH THE SAME WAY AS ORDINARY TROLLEY CARS, BUT WITH THIS DIFFERENCE, THAT THERE IS NO ATTENDANT ON THE CAR TO CONTROL IT.

In brief, it consists of a 30-inch diameter cast iron pipe, one-third of a mile in length, in which four rails have been laid—one on the bottom to support the car, one on each side to keep it in position, and an insulated conductor rail on the top. The pipe as laid, involves a turn of 90 degrees with a curve having a radius of 50 feet, and ascending and descending grades of five per cent. The car which runs through the tunnel is cylindrical in form, about 25 inches in diameter and about 7 feet 3 inches long. The carrying capacity is equivalent to six ordinary mail sacks. Careful records have been kept of the operation of the car, which is almost entirely automatic. The car is started through the tunnel by pushing it by hand until it comes in contact with the overhead insulated rail. When it reaches its destination, the power rail is broken, thus depriving the car of power. Braking is secured by wooden skids in the bottom of the tube, which are raised by a lever on the platform, at the will of the operator. The device will be given careful consideration by



Photograph from "Scientific American."

FOUR TRACKS ARE LAID ON THE SIDE OF THE RAILWAY, ONE AT THE BOTTOM TO SUPPORT THE CAR, ONE AT EACH SIDE TO KEEP IT UPRIGHT, AND A CONDUCTOR RAIL ON TOP.

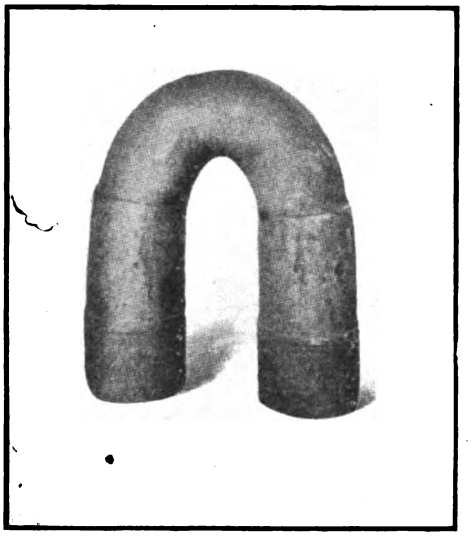
the Commission which has been recently appointed by the Postmaster General to investigate the feasibility and practicability of an underground tunnel between the new post office building located at the Pennsylvania station and the Grand Central Depot at New York City.

HEAT TREATED VANADIUM STEEL IN LOCOMOTIVE CONSTRUCTION.

MASTER mechanics, and in fact all those interested in the problems connected with locomotive construction continue to show keen interest in the question of the advantages of heat treated vanadium steel. Mr. A. F. Mitchell, superintendent of the treating shop of the Carnegie Steel Company at Monhall, Pa., in an adress recently delivered before the Railway Club of Pittsburgh gave a most interesting description of the way in which chrome-vanadium steel was heat treated for use in locomotive work, and the possibiilties from the use of such material. He exhibited in connection with this paper some photographs, one of which is herewith produced and which shows a vanadium steel locomotive main driving axle, ten inches in diameter bent cold without fracture. This piece of steel showed an elastic limit of 75,000 pounds per square inch and tensile strength of 100,000 pounds per square inch. This paper will be found of great interest to shop men and others who are engaged in treating steel of this character. One of the important points brought out in connection with the paper and subsequently discussed was the fact that the essentials of a successful heat treatment are not necessarily an expensive plant but depend upon a uniformly heated furnace, preferably gas or oil fired, of sufficient capacity to avoid bringing the piece of steel too near the bottom, sides, roof or fire to prevent uniform heating. Another point strongly emphasized was the necessity for a pyrometrical installation of sufficiently sturdy construction as not to be liable to get out of order under ordinary shop service. It was further emphasized that this installation should be frequently inspected in order that it shall always be in a good condition. The final point made by the speaker was that the work must, at all times, be under the supervision of a competent person who goes about his task in a scientific manner and through infinite pains turns out a uniform and satisfactory product.



VANADIUM STEEL AXLE, TEN INCHES IN DIAMETER BENT COLD WITHOUT FRACTURE.

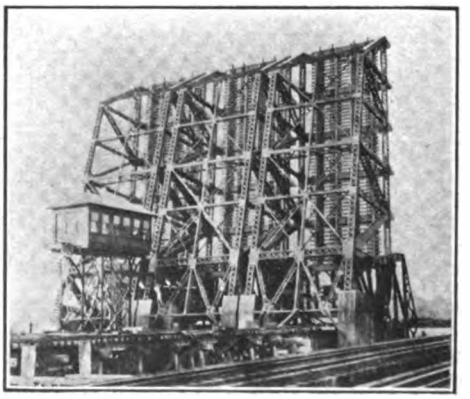
SUCCESSFUL MOTOR-OPERATED RAILROAD LIFT BRIDGES

A LARGE proportion of the railroad lift or draw bridges erected in the last few years where electric current is available, are motor operated. That motor drive is being adopted for this purpose is a significant fact because railroad bridges must be absolutely reliable in operation. Experience has proved that motors are fully as reliable as any other form of drive. They are more economical as there is no maintenance expense when the bridge is not being operated. The control of motors is far simpler than that of any other form of drive, and many protective devices can be installed.

Two interesting installations of motor-operated railroad bridges are those that carry the six tracks of the Harlem River branch of the New York, New Haven and Hartford Railroad over the Bronx and the Hutchinson rivers and over which approximately two hundred trains pass daily. These bridges have been in successful operation now for several years and afford an excellent example of the reliability of electric drive.

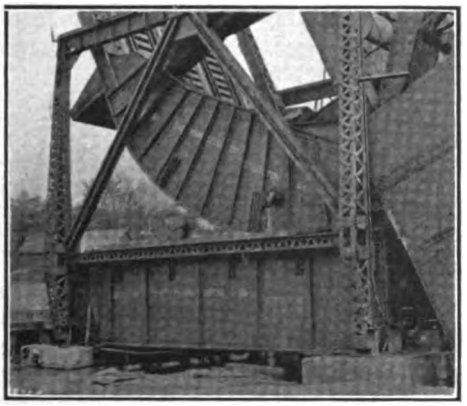
Each bridge is made up of three leaves; each leaf carries two of the six tracks. The Bronx River bridge (numbered 3.40) is near the Westchester Avenue station; the Hutchinson River bridge (numbered 7.73) is between the Baychester and Bartow stations. Both are the Scherzer type rolling lift bridges.

Since the channels spanned by these bridges are only about 100 feet wide, the rolling lift construction was adopted, because this type requires no center pier and involves no obstruction or widening of the channel. Illustrations show the three leaves of bridge 3.40 open, and a detail of the "ways" upon which one leaf rolls; bridge 7.70 is similar in construction. The number of daily



BRONX RIVER BASCULE LIFT BRIDGE, OPEN.

Digitized by Google



ROLLING WAYS AND METHOD OF CONVEYING CONDUCTORS TO MOVING PARTS.

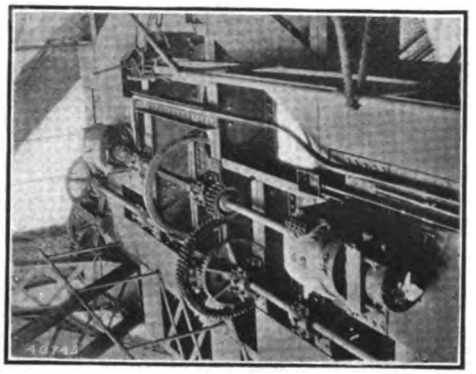
openings varies, averaging five in the case of bridge 3.40 during winter months and 12 during other months. The number of openings of bridge 7.73 is less.

Each leaf is operated by two Westinghouse 25 horsepower, 550 volt, direct current motors mounted on the moving leaf and geared to pinions which project from the side and mesh with racks on the stationary part of the bridge. Under ordinary circumstances the two motors on each leaf are operated together as one unit, but either can be controlled separately and either has sufficient capacity to move its leaf, although of course more slowly than if the two motors are working together. Both motors are provided with an electric brake and each leaf has a separate emergency brake.

The motors, brakes, and other apparatus on the bridge itself are weatherproof, and designed for successful operation through an angle of 90 degrees, through which angle the bridge moves vertically. The conduit carrying the current to the moving part of the bridge can be seen above near the lower left-hand side passing to the upper side of the roll-way, and, (when the bridge is open, as shown) lying along a trench to the point where the conduit is carried up into the bridge itself. As the bridge swings down, the point where the cables enter the leaf moves upward, and the slack cable rises out of the trench.

The bridge is controlled from a tower. To open the bridge the signals are first set against trains, de-rails are opened, and bridge rail lock mechanisms are released. Until these steps are taken, it is impossible to open the bridge. The controllers are then operated and the upward movement of the bridge begins. At four points in its travel, signal lamps are lighted and bells are rung. If the power is not shut off when the leaves are at the proper height, a circuit breaker is tripped automatically. When the bridge is open, the navigation lights on the river change from red to green.

The leaves are arranged in case of emergency to be manually operated by means of an endless chain over a wheel on the counter shaft. Considerable time is required for this and it has never been necessary since either of the bridges were put into service.



OPERATING MOTOR AND GEAR.

The motors and complete electrical equipment for this bridge were furnished and installed by the Westinghouse Electric and Manufacturing Company.

NEW FORM OF RAIL JOINT.

ONE of the most interesting of recent inventions in the railway field is that of a new rail joint which has been patented. The fundamental idea of this joint is seen from the accompanying illustration. Instead of the customary fish plates and bolts, the rails, when in position on the tracks, are locked together by a peculiarly fashioned joint. The advantages claimed for this rail are that it prevents the clicking of the rolling stock when in motion, and eliminates the battering of rail ends; a low joint is impossible, because one rail cannot spring below the other. It is claimed that the track is no more liable to spread at the joints than elsewhere, even though no bolts or other fastenings are used to hold the rails together. It is stated that it is only necessary to raise the rails eight inches to lock or unlock them. In laying the rails ,they are locked together on their sides and then raised to proper position on the ties. It is also claimed that such a track permits of better insulation in connection with signal work.

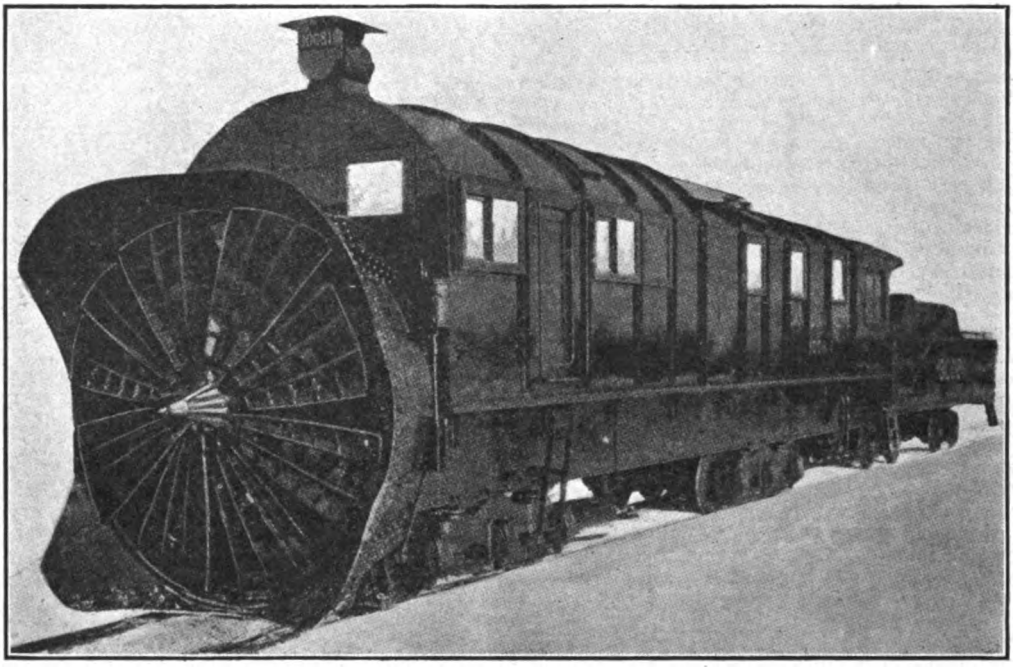
GIANT SNOW PLOW OF THE CANADIAN PACIFIC RAILROAD.

RAILWAY officials are watching with interest the results of a possible adequate test this winter of a steel rotary snow plow, recently constructed by the Canadian Pacific. The general appearance of this giant plow is shown in the accompanying illustration. Up to the present time there have not been sufficiently severe conditions to test fully the capacity and effectiveness of this plow although it has been run through a drift of hard packed snow about 250 yards long, without slowing down. In addition, the plow was pushed by one engine instead of two, which was the custom with the older plows. In the tests of last year, the plow encountered a car coupler in the drift, which was thrown out to one side before it was seen by the crew; the only damage done to the plow was a semicircular piece, about two inches in diameter, broken out of one of the blades. In another instance, the plow encountered a tree four inches in diameter in the drift, which was promptly cut to pieces and thrown out.

The plow has a long frame of 48 feet 4 inches, and weighs 260,000 pounds, distributed appproximately equally on both trucks. The tender attached to the plow has a capacity of 7,000 pounds of water and 16 tons of coal.



A STEEL ROTARY SNOW PLOW RECENTLY PUT IN SERVICE ON CANADIAN PACIFIC RAILROAD.

A TENDER-COMBUSTION TYPE OF LOCOMOTIVE.

MR. WALTER T. RAY, fuel engineer of the Clinchfield Fuel Company, read a most interesting paper before a recent meeting of the Richmond Railroad Club, which has just appeared in the proceedings of that society, on the advantages and disadvantages of a tender-combustion type of locomotive. After pointing out that most of the recent improvements in locomotive construction had been in engine mechanism rather than in the boiler, and that a limit was reached, or soon would be attained, where further development would be impossible, because of the inability of the boiler to supply the required amount of steam, he proceeded to explain the reasons why further development of the boiler was so difficult. He pointed out that if the present grate area and size of the furnace is increased, that the men will be unable to fire it, while, if mechanical stokers are used in order to feed the larger furnace, the firemen will be unable to get at the fuel bed for corrective treatment. He further called attention to the fact that had been brought out by Mr. H. B. MacFarland, of the Santa Fe road, in a recent paper on locomotive drafting and its relation to fuel consumption, that in the present day locomotive of good design about as much power was consumed in producing draft as in pulling their train when the speed was greater than from 20 to 40 miles per hour. If the back pressure on the pistons is to be avoided, a large nozzle must be used, whereupon the draft would fall and the boiler could not be made to steam properly.

Mr. Ray advocated as the only solution of the problem, a tender-combustion type of locomotive, which involves, in substance, a large "Dutch Oven" furnace on the tender, and the elimination of the present fire box in whole or in greater part. He believed that it would be possible to make the tender as long as desired—as long as a Pullman if you wish— and that with such a furnace mechanical firing could be successfully employed. The furnace would be connected with the boiler, according to Mr. Ray, by a flexible con-

Digitized by Google

necting tunnel properly lined with firebrick and magnesia blocks to prevent excessive heat radiation. He pointed out the possibility of putting drivers under the tender, thus continuing the fundamental idea of the Mallet compound. With this type of tender, he believed it would be possible to very much increase the rate of combustion and very much reduce the draft; to decrease the amount of heat absorbed by the fire box (now about one-third of all the heat absorbed); to increase the length of the flues by the length of the present fire box, and to increase the number of flues by making each smaller.

In conclusion, Mr. Ray declared that this type of combustion would decrease the spark loss, now running from 10 per cent to 20 per cent of the heat and coal fired and which, according to him, amounted to about $1,500 annually per locomotive. He further declared that the more perfect combustion which would result would mean a saving of from $600 to $800 annually in the coal bill per locomotive. The greater steaming capacity would result in a greater draw-bar pull which would be particularly noticeable with high speed locomotives. This would eliminate or greatly reduce the necessity for superheating.

VENTILATION OF STEEL SLEEPING CARS.

ALMOST interesting article, by Dr. Thomas R. Crowder, has recently appeared in the *Railway Age-Gazette*, on the ventilation of steel sleeping cars. It will be remembered that Dr. Crowder has made a number of studies of ventilation in sleeping cars, the results of which have been published from time to time in previous years. The former tests were made, however, with the Pullman sleeping car of wooden construction. The present tests deal entirely with the modern steel sleeping cars, which have been recently added to the equipment of the largest railway systems. The tests were made in the first two months of 1912 in thirty-six steel cars; the methods employed were the same as previously followed. Samples of air were collected in various parts of the car and subsequently analyzed. These samples were taken during the night after the passengers had retired, and normal night conditions prevailed. The tests of the air collected from the car body (not from the berths) showed that for the thirty-six cars examined, there was approximately 56,000 cubic feet of air per hour supplied per car or in those cars which were kept entirely closed even to drop sashes in the doors, 53,000 cubic feet per hour. This compares with 40,600 cubic feet per hour for the older type of cars, equipped with the same ventilation device but with deck sash construction, and of 28,300 cubic feet per hour for cars having ordinary deck sash ventilation.

The samples of air taken from the lower berths showed that the average air supply with the steel car equipment was approximately 2,170 cubic feet per hour, per passenger. This compares with 2,030 cubic feet for the lower berths of the older type of cars equipped with the same ventilation device, and with 1,390 cubic feet in cars ventilated by the deck-sash method. The results of the tests, concerning the air supply in upper berths, showed approximately 2,000 cubic feet per hour per passenger as compared with 1,880 cubic feet in the upper berths of the old type of cars equipped with the same ventilation device, and 1,270 cubic feet in cars ventilated by the deck-sash method.

Altogether, the tests of the new type of steel car showed most satisfactory conditions in spite of the abolition of the window in the upper berths and the new type of sleeping car is much better ventilated, much less draughty, and altogether more desirable.

METHODS AND MEANS OF SMOKE ABATEMENT.

THE proceedings of the Engineers' Club of Philadelphia for January contains the paper recently read by Mr. A. R. McBride, of the Department of Industrial Research of the University of Pittsburgh. Mr. McBride ascribes a considerable amount of smoke arising from locomotives to an excess of air passing through the furnace. He stated that it is not unusual to find a condition where from 4.2 to 5.2 times as much air as is theoretically required is passing through the furnace. He pointed out the great loss of heat energy which is involved in heating this excessive amount of air and the consequent loss of fuel and the imperfect combustion which results from an improper mixture. While recognizing the many difficulties which confront the locomotive builders in connection with the many problems of providing at all times a proper amount of air, he nevertheless believes that considerable advancement can be made through careful investigation and perhaps through the use of dampers. He pointed out that it was to the interest of the railroads to exert the greatest activity in endeavoring to abate the smoke nuisance, both from the standpoint of economy, and because of the growing impatience of the public with smoke nuisances, no matter from what source they may arise.

ADDITIONAL LIGHT ON OPEN-HEARTH STEEL RAIL MANUFACTURE.

ONE of the most valuable contributions thus far made to the question of the proper manufacture of open-hearth steel rails, is the paper read by Dr. P. H. Dudley, consulting engineer, rails, tires, constructural steel, of the New York Central lines before the American Institute of Mining Engineers at its February meeting in New York. Dr. Dudley exhibited some photographs showing the condition of the ingots which were used by him in the investigations concerning which his paper was written. We reproduce herewith photographs of these ingots. Dr. Dudley's investigation followed the customary methods, consisting of a chemical analysis of test borings taken at very frequent intervals throughout the entire ingot and of drop and ex-

Digitized by Google

hausted-ductility tests. In connection with this investigation, Dr. Dudley outlined the tests which were now in force in the New York Central division for open hearth rails, and gave the results, in general, which had thus far been attained with these tests.

The present methods employed in testing rails differs somewhat from that followed by many railroad systems. Dr. Dudley stated that the steel manufacturers had at first objected to some of the tests, including the so-called ductility test, on the ground that they were impracticable. The results, however, which had been secured, were so satisfactory that many steel manufacturers had adopted these tests for their own information, using them on rails manufactured for lines which did not require such tests. It will be remembered that the ductility and elongation tests, as used by the New York Central Lines, have been adopted by the American Railway Engineering Association.

Dr. Dudley was of the opinion that the ductility and elongation tests, up to the present time, furnished the best and only practicable means of determining the degree of purification and the physical properties of the steel per melt, in addition he declared that "the ingot should have such relations of area of base compared to the height and weight that under good mill-practice and suitable deoxidizers, it can be made with controlled segregation, and only a trace of a shrinkage-cavity in the top; then, when bloomed under its equalized initial heat, it is rendered pipeless by the usual eight to ten per cent discard.

"Aluminum can be replaced and silicon partly, as deoxidizers, with advantage by the use of ferro-titanium to purify, solidify, and check segregation in rail-, tire-, and axle-steels, and also some of the lower grades of carbon-steels where great purity is desired."

General Appearance of Ingots which were the subject of an interesting study by Dr. Dudley, of the New York Central System.

ADDITIONAL RESULTS OF RECENT JACOBS-SHUPERT BOILER TESTS.

PROFESSOR W. F. M. GOSS, Dean of the College of Engineering of the University of Illinois, under whose supervision recent comparative tests of the Jacobs-Shupert boiler and of an ordinary radial-stay boiler were made, has issued his final and complete report giving the detailed results of these experiments. The preliminary report of Professor Goss was summarized in the January issue of the RAILWAY WORLD, and in connection therewith some of the illustrations, showing the results of the tests, were reproduced. We reproduce herewith some of the more interesting of the later illustrations, contained in the final report, showing interesting features in connection with the test. One of these cuts shows the fire box of the Jacobs-Shupert boiler after the low water test, indicating clearly that the brick arch remains in place and in perfect condition, and showing also the location of the only leak which was observed in the fire box. As contrasted with this an accompanying illustration shows the havoc which the explosion and the antecedent leaks played with the radial-stay boiler. One illustration shows the fire box and what remained of the crown sheet after the test, and also how the arch tubes which were disturbed and forced downward; the other shows the remainder of the crown sheet after a large portion of it had been blown away, the stay bolts remaining, and having torn through the sheet. The series of tables contained in the report showing the fuel tests, the performances of each type as regards evaporation, the test concerning smoke box gases and the statistics derived therefrom will prove interesting to master mechanics. It will be remembered that the tests showed remarkable advantages for the Jacobs-Shupert boiler which came through the severe trial almost un-

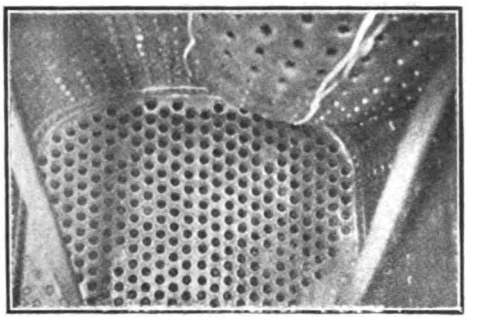
CROWN SHEET FAILURE. MOST OF CROWN AND PORTION OF ONE SIDE-SHEET BLOWN AWAY. STAYS RETAINED THEIR PLACES IN OUTSIDE SHEET.

scathed, while the radial-stay boiler was practically destroyed. Professor Goss's general conclusion is that the Jacobs-Shupert boiler is correctly designed from a theoretical standpoint; that the design permits of a high grade of workmanship; that its construction reduces the cost of boiler

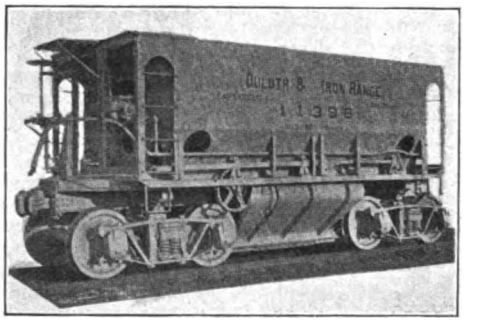


RADIAL STAY BOILER AFTER LOW WATER TEST, SHOWING POCKET IN CROWN SHEET. ARCH TUBES WERE DISTURBED AND FORCED DOWNWARD.

maintenance; that it has equal steaming capacity with the radial-stay boiler; that it possesses advantages as regards circulation of water over the ordinary type of boilers; "that the superior strength of the Jacobs-Shupert boiler under the low-water conditions permits it to endure overheating without failure for long periods of time, where the normal radial-stay boiler quickly fails; and that where the overheating is so severe that it can not be resisted, the result will be a blow-out and not a disastrous explosion."

THE DEVELOPMENT OF STEEL FREIGHT CARS.

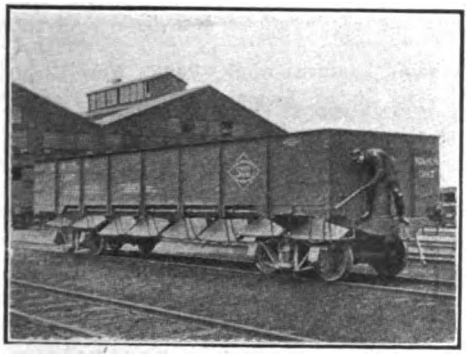
MR. CHARLES LINDSTROM, chief engineer of the Pressed Steel Car Company, delivered a most interesting address before the January session of the New England Railroad Club on "The Development of Steel Freight Cars." After summarizing the obstacles which had to be overcome in the evolution of the steel car the speaker pointed out that the remarkable popularity of this type of car was due to its greater carrying capacity, the small running resistance per gross ton increasing the locomotive tonnage and decreasing ton mile costs, the increased storage capacity of such cars in yards and sidings, their reduced cost of maintenance, their greater scrap value and greater load carrying capacity, in proportion to the dead weight or tare. Mr. Lindstrom explained the principles of design which underlie successful steel car construction, and



LATEST TYPE OF STEEL DUMP CAR, USED FOR HAULING MINNESOTA IRON ORE.

pointed out some of the mistakes in design which had been made by railway companies and had led to unsatisfactory cars. His explanation was illustrated by sketches and designs bringing out the points involved. This technical discussion will be found interesting to car designers and those having to deal with kindred problems.

Perhaps the most striking feature of Mr. Lindstrom's address was the latter portion in which he emphasized the great possibilities of the steel car for special uses. He pointed out, for example, that in the construction of dump cars it was possible by the use of steel to enlarge door openings, which facilitates the quick unloading of cars, thus shortening the delays of cars at unloading points and enabling the handling of a larger tonnage with a smaller number of cars. He emphasized the fact that this was an important ele-



STEEL DUMP CAR, OPERATED BY END LEVER.

Digitized by Google

ment in reducing the comparative car shortage which would otherwise prevail. The amount of shoveling which is required in connection with unloading of cars is very greatly reduced. This is of advantage not only to the railroad companies in handling freight but also to shippers. This portion of the address was made very real by a number of excellent illustrations two of which are herewith reproduced. Some of the latest types of specialized steel equipment was shown. In conclusion Mr. Lindstrom pleaded for a standardization of types and parts which would bring about lower costs of construction and maintenance and codify the valuable features which have been evolved by various car companies and railway companies in previous years.

Electrical

NO important electrification projects of steam railroads have been announced during the past month. It is currently reported that a number of companies are seriously considering electrifying various portions of their system. The unsettled state of the security market, making it difficult if not impossible for the companies to secure funds necessary to carry on such work, and a feeling of uncertainty in some quarters as to the probable attitude of the new Administration, of Congress and of the State legislatures, many of which are now in session, is believed to be responsible for the present situation.

Additional Details Concerning St. Paul's Electrification Project.

IN connection with the plans for the electrification of the Chicago, Milwaukee and Puget Sound Railway from Harloton, Mont., to Avery, Idaho, the main details of which were described in the RAILWAY WORLD for February, the point which is probably of greatest interest to railway officials is the arrangement which is to be made with the various power companies who are to suppply the electrical energy for the line. The contract with the Great Falls Power Company provides that the railway company shall complete the electrification of its line before January 1st, 1918, and shall purchase from the power company energy at the rate of 10,000 kilowatts for the full period of the ninety-nine-year agreement. Two years' notice is to be given the power company of the date on which the delivery of power must commence. The company reserves the option to purchase additional power in various quantities, at specified dates, up to a maximum of 25,000 kilowatts; any additional amount taken under this option privilege is to run for the balance of the contract. The power company is not liable for interruption to the supply, nor the railway company for interruption to its consumption, owing to causes beyond their control, such as strikes, fires or floods. The railway company is made a preferential customer entitled to first service. The contract is to be broken automatically provided the Federal Government at any time enjoins the power company in the exercise of its rights in respect to either its hydro-electric plant or its transmission lines across the public domain.

Energy is to be delivered at five specified points, or less, at 50,000 volts or 100,000 volts, three-phase, sixty cycles, alternating current. The railway company is to transform the energy and distribute it along its line. Twelve months' notice will be given the power company of the location of the delivery points. The rate for energy will be $0.00536 per kilowatt-hour, subject to a minimum bill after the first year of service equivalent to 60 per cent of all the energy contracted for. The power company is required to pay the Federal Government a tax of $.005 per 1,000 kilowatt-hour, for all energy delivered over transmission lines crossing the public domain.

It is unofficially reported that the St. Paul will electrify its main line from Avery, Idaho, through to the Pacific Coast as soon as the 450-mile electric stretch in the Rockies has been completed and is found to be operating smoothly.

President Worthington on Electrification.

PRESIDENT WORTHINGTON, of the Chicago and Alton, writing in response to an inquiry from Thompson, Towle and Company, on the outlook for the substitution of electric for steam power generally on the railroads, states that in his opinion the technical progress of electrification has not progressed sufficiently to meet the various requirements of the railway requirements under the present conditions. He holds that the pressing necessity for the expenditure of vast sums to supply the needs of commerce simply in the way of heavier track, better roadbed and greater yard accommodations, makes the great first cost of electrification a serious obstacle. Furthermore, it is extremely difficult as well as expensive to adapt the present status of electric traction to large terminal and freight yards. Finally, the experience of the few roads which have electrified on a limited scale, he says, has not been such as to establish the comparative economy of electrification.

In three classes of service, President Worthington says, electrification will take place within the next decade: suburban service, where smoke must be eliminated and frequent-stop trains operated at high speed; long tunnels, where smoke gases are dangerous, and heavy mountain grades where water power is available and the uniform pull on the draw-bar produced by electric motors, with great reserve power, is a distinct advantage.

Probable Features of St. Paul's New Electric Locomotives.

IT is semi-offically announced that the initial order for electric locomotives by the St. Paul System will comprise 50 locomotives specially designed to meet the service conditions on that system. Each locomotive must be able to pull a maximum freight tonnage of 2,100 tons up a one per cent grade. On heavy grades helpers will be added. The locomotives will be designed to attain a speed of 30 miles per hour up grade and 25 miles per hour down grade for passenger motors, and 15 miles per hour for freight locomotives.

PENNSYLVANIA RAILROAD'S NEW ELECTRIC TRACTOR.

Electric Tractor for Use in City Streets.

THE Pennsylvania Railroad Company has recently constructed at its Juniata shops, an experimental electric tractor for use in city streets. The tractor is designed to replace string teams of horses and mules used for hauling cars over railroad tracks in city streets for delivery to shippers. Besides the economies which it is expected will be effected by the use of this machine it is believed that the handling of cars will be greatly expedited. As a preliminary to the construction of the tractor the railroad company tried out a number of commercial trucks, none of which, however, proved satisfactory. The general appearance of the tractor is shown in the accompanying illustration. It is unique in that it drives, steers and brakes on all four wheels; this was made necessary because of the short radius curves generally prevailing on the local sidings. The motive power of the tractor is electricity, there being two General Electric motors of approximately twenty horsepower each. The power is supplied by storage batteries which are hung in the center directly under the cab. The battery consists of 80 cells of Edison A—12-H and weighs 43,050 pounds. The tractor has a total length over couplers of 23 feet, a wheel base of 12½ feet and a weight of 28,850 pounds. The drawbar pull under normal conditions is about 800 pounds, while the maximum pull is 21,500 pounds. The normal speed with normal loads is about six miles per hour.

Legislative Proposal to Compel Use of Electric Headlights.

IT is currently reported in the newspapers of Chicago that a bill is to be introduced in the Illinois Legislature, within the next few weeks, providing for the use of electric headlights on all locomotives operated within the State. It is expected that much opposition among railway officials will develop to such a law. Many believe that the Wisconsin statute which requires railroad companies to equip their locomotives with headlights that will enable an engineer to see an object 800 feet away, but leaving the type of headlight to the discretion of the company, is a much more desirable statute.

Locomotive engineers have complained that electric headlights, because of their great brilliancy, often obscure signal lights, and thus are a contributing cause of accident. This matter was treated exhaustively in a paper by Mr. C. R. Larson, assistant chief engineer of the Railroad Commission of Wisconsin, recently read before the Western Railway Club.

Right of Philadelphia to Eliminate Smoke Nuisance.

CITY SOLICITOR RYAN, in a communication to Director Cooke, of the Department of Public Works, holds that the city of Philadelphia has the right under existing laws and ordinances to restrain the offensive emission of smoke within the city limits by injunction or such other proceedings as may be found advisable. This, he holds, applies to locomotives in operation or standing in roundhouses or yards. The City Solicitor is also of the opinion that it is within the power of the State of Pennsylvania by Act of the Legislature to compel the electrification of railroads operating within the limits of populous cities. "The city of Philadelphia would not have the right to require the electrification of such railroads, though possibly other ordinances upon the subject of smoke, which would be within its power might indirectly have that effect."

It is unlikely, however, that this question will ever come before the courts for the Pennsylvania Railroad Company has recently announced that it intends to electrify its lines within the city as soon as this step is feasible.

Progress of the Electric Locomotive.

THE leading editorial in the Electric Railway Section of the *Commercial and Financial Chronicle*, issued under date of January 25th, is a most interesting discussion of the pro-

Digitized by Google

gress of the electric locomotive. After commenting upon the rapid progress of heavy electrification in this country and abroad the editorial points out the many recent technical improvements which have been made in the electric locomotive and the rapid approach to the standard types and conditions which is apparent from a review of the specifications covering recent orders. The points of superiority of the electric locomotive over the steam engine, as explained in a recent article by Mr. A. A. Armstrong, of the General Electric Company, which was summarized in the February issue of the RAILWAY WORLD, are finally recounted.

Additional Electrification on the New Haven.

THE New York, New Haven and Hartford Railroad has announced that the line between Stamford, Conn., and New Haven, forty miles in length, will be ready for operation by electric power on July 1st, next. When this stretch of track has been put into service, trains can be hauled by electric locomotive from New York to New Haven, a distance of 74 miles.

Progress of Denver and Rio Grande's Electrification.

IT is expected that the work of electrifying the western end of the Denver and Rio Grande's line between Helper and Salt Lake City in Utah, a distance of 15 miles, will be practically completed by July 1st, of this year. The electrification of the line from Minturn to Salida across the Tennessee Pass in Colorado, a distance of 87 miles, will be completed in 1913. The Utah Light and Power Company will furnish the power for the first line while it is expected that the Central Colorado Power Company will supply the power for the Colorado line, unless the railroad company decides to install a plant of its own near Tennessee Pass.

TERMINAL IMPROVEMENTS.

Philadelphia Passenger Terminal Improvements.

THE President of the Pennsylvania Railroad Company has made the following statement regarding Philadelphia Passenger Terminal Improvements:

The directors of the Pennsylvania Railroad Company have not authorized terminal improvements at Broad Street Station and will not until final plans and recommendations are ready for their consideration. When definite conclusions have been reached, the management will take pleasure in fully informing the stockholders and the public.

The question, however, involves consideration of: first, the layout and improvement of Broad Street Station; second, methods and plans for accommodating the through and local passenger, baggage, mail and express traffic, for probably the next twenty years, of six separate railroad divisions using that terminal, namely, the Main Line, New York Division, Philadelphia, Baltimore and Washington Railroad, Philadelphia and Baltimore Central Railroad, Schuylkill Division, the Chestnut Hill Branch, and the Atlantic City trains; third, whether it is advantageous to change from steam to electricity for local traffic on any of these divisions; fourth, whether these improvements will be affected by the proposed rapid transit development of the City of Philadelphia; fifth, a large space to accommodate the employees, as the parkway as laid down on the present city plans, unless revised, will remove the northeast corner of Broad Street Station and the annex office building on Filbert Street, and these offices must be replaced.

The public and the press will, therefore, appreciate that there are many and complicated problems to be solved and are respectfully requested to discourage the circulation of unauthorized rumors and impossible plans for improvements.

The Pennsylvania Railroad Company established and has maintained in the center of Philadelphia for thirty years a large and convenient station, whereas for New York City, with which comparison is frequently made, the Company's terminals were in Jersey City, requiring transfer by ferry across the Hudson River, until the system was extended into New York in 1910. Around Broad Street Station as a center, the business, hotel and recreation activities of Philadelphia have grown and the Company's expenditure must be to enlarge and improve its transportation facilities and continue to maintain not one terminal station, but three important stations in Philadelphia, namely, Broad Street, West Philadelphia and North Philadelphia.

The Passenger Terminal question is receiving active and continuous consideration, the acquisition of the extensive property required is being consummated, and a large amount of important work, involving an expenditure of several millions, is in progress in various parts of the City of Philadelphia, notably that between West and North Philadelphia, including the new double-track bridge over the Schuylkill River and the additional tracks, and enlargement of North Philadelphia Station, a new bridge over North Broad Street, a new connection for the Chestnut Hill Branch, and other facilities to accommodate the traffic.

Therefore, the city may rest assured that its needs will not be overlooked, and the Company will do its full duty in providing an adequate transportation service.

New Passenger Stations for Northern Pacific.

ILLUSTRATIONS are shown herewith of the Northern Pacific Railway Company's new passenger station at Centralia, Washington, recently completed. It is a typical example of the better class of passenger stations being erected by this company, at various points along its lines, both as to architectural features and materials used.

The station at Centralia comprises three units, viz: one main building, partly two-story, containing on the first floor, waiting rooms, toilets, ticket office and baggage room; an express building and a lunch building, the latter two

The Interstate Commerce Commission

Commission Calls for Traffic Statistics.

THE Commission having conferred with prominent railway officers and secured the co-operation of a committee of the Association of American Railway Accounting Officers, is considering the question of formulating a general scheme of traffic statistics under which reports would be made by the carriers giving information such as might be useful to the Commission in considering questions before it, especially questions regarding increases or decreases in freight rates. As a preliminary to this, a circular has been issued signed William J. Meyers, statistician of the Commission, calling for information from the railways as to the practicability of making the proposed report, and asking also for opinions as to the best method of procedure. It is desired to have records of the movement of important commodities from principal traffic centers to other traffic centers, showing both tonnage and revenue; the tonnage is shown also in carloads. In the circular now sent out Mr. Meyers presents a suggested standard list of commodities; a standard list of districts of production and of consumption and a sample statement form. Under one of the plans proposed all of these traffic statistics would be made up at the station of destination so as to insure accuracy in spite of diversions in transit and other irregularities, such as stopping in transit for manufacture or partial manufacturer. The tentative list of commodities contains ninety-eight items. The tentative list of points of origin and destination covers the whole of the United States, and also has a dozen items to represent foreign countries; for example, the districts in Massachusetts are (1) Boston, Cambridge and Lynn; (2) Brockton; (3) Fall River, New Bedford; (4) Holyoke, Springfield; (5) Lawrence, Lowell; (6) Somerville; (7) Worcester; (9) remainder of Massachusetts. Railway officers receiving this circular are asked to make criticisms or offer alternative plans and to give an estimate of the expense of producing records under the plan proposed.

New Accounting Method.

THE Commission has completed the tentative draft of new schedules affecting certain features of railway accounting not heretofore covered.

Inasmuch as the Public Utilities Commissions in most of the States adopt such regulations, when laid down by the Interstate Commerce Commission, the new schedules will, it is expected, be in force throughout the greater part of the country by July 1st, next.

Pipe Line Order Modified.

ANOTHER modification of the pipe line decision has been announced by the Commission whereby the companies are given until March 15th to file tariffs of their rates for transporting oil similar to any common carrier. The lines had been ordered to file these tariffs by February 1st, but owing to the fact that the Commerce Court has under consideration an appeal of the pipe lines from the decision of the Commission, the date was postponed until after the court has acted.

Hearing Under the Long and Short Haul Clause.

THE Commission has set March 17th, 18th and 19th, for the dates on which arguments will be presented by the railroads as to why the present scheme of rates should be maintained between Eastern and lake points to points in the southeast and on the gulf. The railroads have petitioned for authority to continue lower rates from New York City, New Orleans and the Ohio River crossings to South Atlantic and Gulf ports, to points on certain navigable rivers and to Birmingham, Ala., and Atlanta, Rome and Cordele, Ga., than are concurrently effective on lake traffic to intermediate stations.

Tap Line Rates.

RAILROADS in the southwest and south have been ordered by the Commission to re-establish through and joint rates with a number of their tap-line connections. These rates had been ordered cancelled.

The establishment of through rates is to be maintained for a period of two years, and the joint rates for a period of sixty days.

Free Delivery at Washington Discontinued.

THE Pennsylvania Railroad has filed with the Commission notice of its intention to discontinue, March 1st, its free delivery of freight in the City of Washington. This system of free delivery in that city was inaugurated by the railroads themselves in 1883 to free themselves of the then serious freight conges-

JOHN H. MARBLE,
Secretary, Interstate Commerce Commission.

Digitized by Google

tion. The free delivery at that time took in a very limited area, but like all abuses it grew until finally, it took in practically the entire city.

Ruling on Charity Freight.

THE Commission has issued a ruling in reference to free transportation of shipments for charitable purposes. The ruling of the Commission which covers one specific case is as follows:

"The Upper Iowa University is a denominational college maintained largely by voluntary contributions from persons interested in educational and charitable work, it exacts tuition from all students able to pay, but for worthy and needy students free tuition is provided through scholarships donated both by persons connected and those who are not connected with the college. Certain coal dealers in Chicago contribute free coal to the college. The question is whether under section 22 of the act to regulate commerce railroad companies may carry this coal without exacting the regular tariff rate. Held, that section 22 of the act does not permit of transportation of this coal at other than the tariff rate."

Wreck Responsibility Placed.

THE Commission finds Enginman Yorke and Brakeman Gross responsible for the wreck on the Cincinnati, Hamilton & Dayton Railroad in the suburbs of Indianapolis, November 13th last, which caused the death of fifteen persons and injury to eleven others.

Commission holds Flagman Cunningham of an excursion train on the Yazoo & Mississippi Valley Railroad responsible for a wreck on November 12th last, near Montz, La., when fifteen persons were killed and many others injured.

State Pass Investigations.

THE latter part of January it became known that the Commission had under investigation the improper and illegal use of railroad passes. On January 22nd, it was stated, to use the language of the Commission, that "carriers have very generally obeyed the letter of the law," but it is indicated by information that has reached the commission that the "issuance of passes for State travel has operated to defeat the purpose of the act to regulate commerce; that passes for State travel have been issued to certain shippers and denied to others; and that the moving consideration of such passes has been the routing of interstate shipments of property."

Since that time, Commissioner Harlan has conducted an investigation of the distribution of railroad passes in Colorado. He examined 100 witnesses in three days and accumulated an enormous fund of information.

The evidence disclosed the fact, he says, that the roads were engaged in the indiscriminate issuance of passes to get traffic and influence legislation. It was found that no less than 1,487 persons rode "dead-head" in a single day on the Denver & Rio Grande and of 36 passengers in a single coach on the Colorado & Southern, 21 had free transportation.

Of the judges of the Supreme Court to whom annuals were sent, only two returned them. One road gave 1,865 annuals, 1,942 trip and 275 term passes in six months. Of State officials 497 rode regularly on annuals and the same was true of 187 county officers. It was conceded by the railroad officials who testified that in most sections of the State rates can be given and money saved by the carriers if the custom of granting passes is abolished.

Under existing conditions, however, the roads claim that they are powerless and that their business would be greatly reduced unless they resorted to such methods, which have been in vogue for many years.

Commissioner Harlan says that investigations of the same character will be conducted in several other States. Under the law the railroads must keep a record of all free transportation issued with the reasons therefor, and the Commission is authorized to examine the books. The Commission's interest in the matter rests in the fact that the indiscriminate issuance of State passes often has a decided effect upon the movement of interstate shipments or persons.

Transit Privileges Cancelled.

THE Commission after a re-examination of the entire subject of transit privileges on all commodities, but chiefly on lumber and grain, has issued an order cancelling all previous orders and requirements of the Commission designed to prevent evasion and violation of the interstate commerce law in the granting of such privileges. The order applies to all commodities enjoying, or supposed to enjoy, milling-in-transit or manufacturing-in-transit privileges.

This action was based on the promises to the Commission of the big railroads and bill milling and other interests concerned to publish and enforce transit privileges in their tariffs that will permit the operation of the privileges and at the same time conform to the law.

The Commission has had milling-in-transit abuses, and the alleged granting of rebates under this privilege under consideration for more than a year.

Express Companies Demonstrate Their Losses Under Reduced Rates.

TO demonstrate to the Commission the effect of the reduced rates it proposes, the express companies have reported that had the proposed rates been in effect on October 23d, a test day selected, the reductions in their revenue would have ranged from 4.96 to 30.6 per cent.

The day's receipts for the Adams would have been reduced $18,291, or 23.6 per cent; the American, $19,824, or 24.2 per cent; the Southern, $9,708, or 30.6 per cent; the United States, $10,419, or 22.3 per cent, and the Wells-Fargo, $16,832, or 25.2 per cent.

These five companies assert that the application of the reductions would have resulted in a total loss of $24,996,047.25 in their business for the year ended June 30, 1912, "equivalent to an operating deficit of 5.42 cents for every dollar of gross transportation revenue collected."

The Great Northern Express Company shows

Digitized by Google

a reduction of 16.01 per cent, which would have produced a deficit, based on the business of the last fiscal year, of $3,320. The Northern Express Company figures a reduction of 17.3 per cent, which would leave its earning power "less than 1.4 per cent on the capital stock."

The Western Express Company's estimated loss of revenue would be 4.96 per cent. This is explained by the facts that it operates under rates fixed by some State Legislatures at a comparatively low figure. The Globe Express Company, another western corporation, also is operating under rates fixed by many States.

No intimation is given by the Commission as to when it will enter an order in the express investigation, but it is expected some time in the spring and probably will be made effective two or three months later.

Telephone Inquiry Ordered.

THE Commission has issued a formal notice of the beginning of an investigation into the business of the telephone and telegraph companies. That this investigation would be made became public some time ago when Attorney-General Wickersham announced that he had decided not to take any action against the American Telephone & Telegraph Company under the Sherman Anti-Trust law, but would turn all the data in his possession over to the Commission.

The notice issued by the Commission to-day is as follows:

"Information having been lodged with this Commission to the effect that the American Telephone & Telegraph Company, by the operations of itself and allied companies, is attempting to monopolize the telephone and telegraph business of the United States and is fast driving out of existence independent companies, and further, that this company and other telephone and telegraph companies are guilty of unlawful discriminations and are imposing unreasonable rates, rules, regulations and practices in the conduct of their business.

"It is ordered that a proceeding of inquiry and investigation be, and it is hereby, instituted into and concerning the history, the financial operations, the rates, rules, regulations and practices of telephone and telegraph companies subject to the act to regulate commerce with a view to the making of a comprehensive report and to the issuance of such order or orders, as may be necessary to correct such discriminations and make applicable reasonable rates and practices."

Improvements from Earnings.

THE Commission has handed down a decision in which reference is made to a new system of making rates which may have an important bearing on cases pending and which appears to forecast a future policy of the Commission in fixing rates. It is intimated in the decision referred to that the railroads have not made improvements with surplus and with earnings that would tend to decrease the cost of operation and that with the constant increase in wages and no effort by the carriers to improve the efficiency over the line which the traffic is moved, the inevitable result is an increase in the cost of movement.

"If the carrier," says the Commission, "for reasons of its own, does not make the character of improvements that will reduce the cost of operation, it hardly lies with it then to claim that it may raise the rates because the cost approaches or overtakes the revenue."

The decision of the Commission was made in a proceeding begun by the Commission against the Louisville & Nashville Railroad on complaint of shippers. The shippers charged that proposed increases in the rates on coal and coke, from mines and ovens on the Cumberland Valley Division of the Louisville & Nashville road in Virginia were unreasonable and unjust.

The railroads sought to increase the rates on coal to the Ohio River and to points south 25 cents per ton from the Appalachian district and 15 cents per ton from the St. Charles district. The Commission permanently suspended the proposed increase and ordered the present rates to continue, holding that the railroads, particularly the Louisville & Nashville, had not sustained the burden placed on them by law of showing the reasonableness of the proposed advances.

In substance the Commission in its decision holds that at present carriers have the wrong method of fixing rates by allocating cost of service and that they include items which should not be taken into consideration in fixing specific rates. In fixing specific rates the Commission holds, only the cost of fuel, wages of crews and repairs to locomotives and cars should be taken into consideration, this being about 50 per cent and should eliminate the remaining 50 per cent, made up chiefly of salaries of general officers and way and structure account.

Freight Bill Inquiry.

AN investigation of railroad freight bills is to be undertaken by the Commission. Complaints have been filed to the effect that railroads have failed to establish just and reasonable regulations affecting receipts or bills for freight charges, and that the present practices of the roads in this regard are discriminatory and otherwise unlawful. All roads subject to the Interstate Commerce Act are made parties to the investigation, including rail and water carriers, but excepting express companies. No date was set for beginning the investigation.

The Commission announced that it wishes to determine by the inquiry whether the freight bills shall include the following:

The point of origin.

The date of shipment.

The correct weight of shipment.

The route, including the name and initials of each carrier participating in the haul, and the junction points through which the shipments moved.

The initials and number of the car.

Adequate description of the property transported.

The rate or rates applied to the transportation.

A statement of the nature, amount and point of accrual of each item of charge for stop-in-transit, reconsignment, switching, car service,

Digitized by Google

storage or any other charge incident to the transportation.

Where such bills are presented to the consignee they should also show the name of consignor and date of arrival of shipment at destination.

Reparation Denied Wool Shippers.

THE Commission has issued a ruling in which it denies reparation asked for by wool shippers on the Pacific Coast and at Rocky Mountain points.

On complaint of the National Wool Growers' Association, National Mohair Growers' Association, and the Railroad Commission of Oregon, the Commission held, on March 21, 1912, that the freight rates were unreasonable and directed that they be reduced. Later, in the spring and early summer of 1912, the railroads put into effect the lower rates suggested by the Commission. In its decision the Commission reserved the question of granting reparation, requested by shippers on all shipments during the period from two years prior to the filing of the complaint until the date the reduced rates became effective. The Commission held that reparation would be granted only for shipments under the old rates after the date of the Commission's findings.

The following principles were laid down for awarding reparation:

"It is by no means true that because a rate is found unreasonable upon a given date it has been unreasonable during the two years preceding, and it cannot be assumed that whenever the Commission holds a given rate to be unreasonable it will, as a matter of course, award reparation on the basis of the rate found to be reasonable as to all payments within the two year limitation.

"The Commission is not satisfied that the complaint has shown that the rates as stated in the tariffs of the carriers were unreasonable up to the date of the original decision herein, March 21, 1912, but from that date the rates and regulations suggested by the Commission are held to be unreasonable and the rates and regulations of the carriers have been unreasonable and unlawful to the extent that they have varied from these.

"Reparation from March 21, 1912, will be awarded herein upon the basis of the rate found reasonable by the Commission."

The Commission has also issued a conference ruling amending its regulation regarding reparation allowances, to read as follows:

"Reparation under informal proceedings will be authorized in instances where the tariff rate has been applied, upon the filing of an application by the carrier or carriers which participated in the transportation of the property in question, containing an admission that the rate charged was unreasonable, supported by a statement of the facts substantially showing that the charge demanded for the transportation service performed was excessive, that within a reasonable time a tariff naming the rate upon basis of which adjustment is sought has been published and that such rate has been made lawfully applicable via the route over which the shipment moved. The Commission's order for refund on account of a reduced rate or changed tariff regulation will require the maintenance of such rate or regulation for at least one year."

Rate Suspension.

RECENT rate suspensions include Louisiana lumber rates from Alexandria, La., to New Orleans and other Louisiana points; to Cairo, Ill., St. Louis and other points; fence posts from stations in Arkansas to Kansas City, Mo., and other points; joint rates on lumber from points in Mississippi to Trunk Line territory; rates on lumber from various points in Oregon and Washington to a number of Eastern destinations; certain class rates from points in Pennsylvania, to St. Paul and other destinations; break-bulk rates on grain and grain products from Milwaukee and other points in Wisconsin to Boston, New York, Philadelphia, Baltimore and other Eastern points; grain rates between Iowa, South Dakota and Minnesota points to points in Illinois and Wisconsin; rates on starch from Cedar Rapids, Iowa and other Missouri River points; and rates on tile between points in Central Freight Association territory. The Commission has also suspended the proposed advances in oil storage rates of the railroads operating in Central Freight Association territory and has suspended the new tariff reconsignment and storage privileges on lumber and shingles at Minnesota Transfer, Minnesota.

Higher Rates Approved.

THE Commission has approved the following advances in rates: On knitting factory products from Chicago and nearby points to Little Rock and other Arkansas points; on nitrate of soda and potash salts from New Orleans to Little Rock, Arkansas; on empty tight cooperage barrels in Southern classification territory; on hay from North Dakota, South Dakota, Minnesota, Wisconsin, Illinois and Iowa to Chicago and other Western markets; on trunk covering materials including tin plate and sheet metal from Eastern shipping points to points in Washington, Oregon and other destinations; on asphaltic pitch, tar, cement and other roofing and paving materials from Chicago, Milwaukee and other points to destinations in North and South Dakota, Montana and other States, and on cantaloupes and other fruits and vegetables from Ruston, Louisiana and other points to Chicago, Illinois and other interstate destinations.

Recent Decisions.

THE Commission has rendered a decision to the effect that the proposed increases of rates on coke and coal in car loads from the mines on a portion of the Cumberland Valley Division of the Louisville & Nashville Railroad, effective by tariff schedules as of March 1, 1913, are without justification and the increases are proscribed.

Present rates are found reasonable and are prescribed for the next two years.

Advances in freight rates on cedar fence posts from Arkansas points of production to Kansas City, Omaha and Lincoln, proposed by the St. Louis, Iron Mountain & Southern and other railroads, have been ordered by the Commission to be cancelled by April 1st.

Digitized by Google

The Commission has vacated its order of suspension issued against the advances in proportional rates by the Boston & Maine and other railroads on excelsior and excelsior wrappers from certain stations on the Bangor & Aroostook Railroad to Brownsville Junction, Me., and other points.

In the case of the Indianapolis Freight Bureau against the Cleveland, Cincinnati, Chicago and St. Louis and other railroads in which an effort was made to remove alleged discriminations against Indiana points in the matter of grain rates it appeared that the freight tariffs of the lines south of the Ohio River provided that proportionate or shrinkage rates would not be applied on shipments of grain or grain products on which milling-in-transit privileges had been accorded at points north of the Ohio River and east of the Illinois-Indiana State line.

It was held that there were no logical grounds upon which there could be denied to Indianapolis and other Indiana points the full use at the same aggregate through charge of the privilege which was accorded to all other points on the same route. The decision also stated that the commission had never recognized the right of a carrier to fix its rates to or from a given point on a higher level than they otherwise should be, in order to prevent one community from competing with another or to keep the products of one community out of a territory, the wants of which might be fully supplied by another community.

In the case of the Rhinelander paper against the Minneapolis, St. Paul and Sault Ste Marie Railroad, the Commission holds that the rate of 6 cents on pulp wood in carloads from Trenary, Delta Junction and Manistique, Mich., to Rhinelander, Wis., is not unreasonable. However, the Commission ordered a reduction of 1 cent to be made in the rate of 7½ cents on pulp wood in carloads from Whitedale, Bavee, Christiansen Spur and Spur No. 447, Mich., to Rhinelander.

Upon the complaint of the Wichita Wholesale Furniture Company the Commission held to be reasonable the rate of 50 cents on furniture in carloads from Fort Smith, Ark., to Wichita, Kan.

In the case of C. M. Patillo against the Atlanta & West Point and other railroads the Commission ordered the rate of 93 cents on household goods in carloads from West Point, Ga., to Waco, Tex., reduced to 77 cents per 100 pounds. The reduced rate is to take effect April 1st.

Freight rates on refined sugar by sea and rail routes from Boston, New York, Philadelphia and Baltimore to points in Arkansas, are held by the Commission to be unreasonable and certain reductions have been ordered.

The Commission has ordered railroads in the southwest and south to re-establish through and joint rates with a number of their tap line connections. These rates had been ordered cancelled.

STATE COMMISSIONS.

Illinois.—Before the State Railroad Commission, shippers are opposing the proposition to adopt the uniform bill of lading recommended by the Interstate Commission.

It is declared to be in conflict with the State law of Illinois in regard to the liability of the carrier in case of loss or damage where the commodity has changed in price after the original shipment was made. The carriers claim they seek only uniformity and are willing to make exceptions until such time as the statutes can be amended to fit the situation.

The Commission will wait until the federal body has shed more light on the situation, as to its final position on the bill of lading proposition. The uniform bill of lading has had an unpleasant experience from the beginning of the action of the Commission in recommending it and the course adopted by Illinois shippers may complicate matters further in other localities.

Louisiana—The following rule has been adopted by the State Railroad Commission:

"It shall be the duty of all railroad companies operating in the State of Louisiana, to return to shippers, within forty-eight (48) hours, all bills of lading, duly signed, covering shipments from our agency stations."

Maryland.—The annual report of the State Railroad Commission shows that for the year ended September 30th last, 179 were killed and 9,308 injured, an increase of 37, or 26 per cent killed and 1,180, or 14.4 per cent injured. The report says:

"Much the greater part of the injuries are trivial and mainly due to carelessness on the part of the public.

"In the case of steam railroads the increase in fatalities to the public is due principally to trespassing on the property of the companies. Passengers show an increase of one killed, but there is a marked decrease in the number of passengers injured.

"In the operation of electric railways persons killed number 33, an increase of 2; the injured, 6,365, an increase of 680; employes, 4 killed, the same as last year; injured, 1,367, an increase of 190.

"The grand totals are increased in the present report by the inclusion of telephone companies, which have not heretofore reported accidents."

The Commission states that in the year there were filed in the regular docket 249 cases, of which 215 were closed. The cases on the correspondence docket numbered 268, all except 41 of which were closed. The report reviews some of the more important cases decided by it, and in an interesting table shows that there are 200 corporations under the jurisdiction of the Commission and that these, including the Pullman Sleeping Car Company, the railroads and express companies, have a total capitalization of $1,428,655,886.

It is recommended that the law providing for the appointment of a member of the Commission's legal department to represent the people in cases before it be amended so that the officer in charge of such cases may be entirely independent of the Commission.

Counsel for the Public Service Commission, has placed in the hands of the Circuit Court, a petition of the Commission, asking the court to restrain the Baltimore & Ohio Railroad Co. from going ahead with its $63,250,000 bond issue without submitting the matter to the Commission and securing its approval.

The case will ultimately go to the Court of Appeals, passing on the question whether the

Digitized by Google

company's charter granted in 1827 and giving the company authority to issue securities from time to time as they may be needed, puts the company beyond the jurisdiction of the Public Service Commission as far as the issue of securities is concerned.

Nebraska.—In its annual report, the State Railway Commission recommends to the Legislature that it be given a number of new powers chief of which is the power to include the awarding of reparation in cases where the rates are found to be excessive or discriminatory. Should the Legislature give the Commission this power, all cases of this nature will in future be heard by the Commission instead of the regular courts.

When, in 1909, the Legislature enacted a "stringent" anti-pass law, some enterprising member slipped in a little "joker" which well nigh renders abortive any attempt to prosecute an offender of the law.

The joker places the burden of proof upon the State and makes the prosecuting attorney prove the use, as well as the acceptance, of the railroad pass in order to secure conviction. Since all the proofs are in the hands of the railroads and are not accessible to the State, the law has been practically a dead letter. The Railroad Commission, in its lists of recommendations, asks the Legislature to remove the "joker." Among other recommendations made are these:

An amendment to include all common carriers under the jurisdiction of the Commission in the statistical report to be made to the governor. To provide that no new rate schedule or classification may be made effective until approved by the commission.

To provide for the punishment of shippers and railway officials and employees guilty of false billing of freight.

The enactment of a law providing track connection to other industries beside grain elevators on practically the same terms as are now enjoyed by grain elevators exclusively.

Provisions for taxing costs in cases arising before the Commission wherein it becomes necessary to subpœna witnesses and disposing of funds accumulating therefrom.

Nevada.—The Railroad Commission in an opinion and order written by Commissioner Shaughnessy, has ordered the Southern Pacific Company within Nevada to reduce the present local one-way passenger fares between all points on its standard gauge main and branch lines from 4 and 5 cents a mile to 3 cents a mile. Chairman Barline dissents from the majority opinion on the ground while entirely favorable to a reduction to 3 cents a mile on the main line, he is opposed to any reduction in fares on the branch lines.

New Jersey.—In its annual report the Board of Public Utility Commissioners, in discussing the proper methods to be employed in the elimination of grade crossings states that:

"A solution of the problem of grade crossing elimination will be hastened by a recognition of the justice of distributing the cost between the carriers and the public, as represented by the State and the municipalities. There are cases where the grade crossings within the past two years have been forced on the carriers against their will. It is indisputable that in such cases the entire cost of removal could not be put upon the carrier without a gross violation of the dictates of common fairness. Where progress has been most marked in eliminating grade crossings, as in Massachusetts, there has been an equitable partition of the cost of elimination.

"Moreover, it must not be forgotten that the investment in grade crossing elimination cannot be had for nothing. If the companies are to spend the vast amounts such elimination requires, the consumer must expect in rates and fares to contribute to the cost. If the companies at their own expense exclusively pay the cost, the indemnity they may reasonably exact will be heavier than if the public contribute in the first instance to the project .and thereby obtain some rightful control over the process of elimination."

New York.—Reductions in commutation rates between Westchester County points and New York City by the New York Central & Hudson River Railroad have been ordered by the Public Service Commission, Second District. The reduced rates will result in the establishment of the tariffs that were in effect on June 30, 1910.

The orders were made upon complaints filed in the New York Central case by the mayors of Mount Vernon and Yonkers, residents of Peekskill and White Plains, and in the New Haven case upon the complaints of the mayors of Mount Vernon, New Rochelle, the Village of Port Chester and the towns of Rye and Harrison, and the residents of the City of New Rochelle and Village of Port Chester.

Following the above orders a further order was issued requiring the New York Central & Hudson River Railroad, in changing its rates, to restore similar rates from Poughkeepsie and points as far south and Peekskill on the Harlem Division and from White Plains to Pawling on the Harlem Division, which existed prior to the increase of 1910.

In its resolution, the Commission recites that no specific complaint was made before the Commission touching the commutation and these other rates, but the evidence in principle, covers such rates, and it appears to the Commission from all of the evidence that the change in commutation and other rates between the sections of territory named and New York City, made in 1910, was unreasonable, and that such rates should be restored to the point at which they stood before that increase.

The Commission has authorized the New York, Ontario & Western Railway Company to issue $2,880,000 in bonds and equipment obligations, and the New York and Stamford Railway Company to issue $573,000 mortgage bonds for paying loans and notes for capital purposes.

The complaint made by Tompkins C. Delavan and others, asking the Commission to cancel the purchase by the New York, New Haven & Hartford Railroad from the New York Central and Hudson River Railroad, of 23,035½ shares of stock of the Rutland Railroad has been dismissed.

Ohio.—The State Railroad Commission has authorized the issue of $7,000,000 bonds by the Panhandle. The bonds will not be issued immediately. They will be used as follows: $4,000,-

Digitized by Google

000 for construction and equipment purposes and $3,000,000 to provide for the issue of Steubenville and Indiana bonds maturing January 1, 1914.

It has also authorized the Cleveland Short Line Railway Company to issue its common capital stock of the par value of $1,000,000 to be sold at not less than par and the proceeds to be used for the completion of a double-track line.

Pennsylvania.—The State Railroad Commission has not as yet rendered its decision on the application of the complainants in the Philadelphia anthracite rate case for the appointment of an accountant to examine the books of the Reading Railway to determine whether cost sheets are being kept as alleged in Wharton Barker's affidavit.

It will be recalled that at the special hearing a few weeks ago, when the affidavit was submitted. Commissioner Pennypacker said the request would be acted upon by the entire Commission. An indefinite adjournment was then taken for that purpose. The filing of briefs was also postponed for the same reason.

Should the Commission decide against the appointment of an accountant, it is understood that the complainants are ready at any time to file their brief. The appointment of an accountant, of course, would give an entirely different turn to the whole case and reopen it from an altogether different point of view.

Texas.—A hearing will be held by the Railroad Commission on March 11th, on amendments to freight tariffs affecting rates on classes and commodities, between Galveston, Texas City, Velasco and points on the St. Louis, Brownsville & Mexico, the Rio Grande, the San Antonio & Rio Grande and the San Benito & Rio Grande. These amendments are intended to eliminate all provisions for the observance of a differential over Houston, (meaning the Galveston differential) in arriving at rates between the ports named and points on the railroads mentioned.

Only south Texas lines have been named, because they do not pass Houston to reach Galveston. The differential on cotton over the Brownsville & Mexico is not now in effect having been replaced by a uniform rate of 48 cents to both Houston and Galveston. This is cited as further evidence of the intention to make the abolition applicable to all Texas lines. With other lines the maximum rate from points within a distance of 100 miles of Houston is 45 cents, and to Galveston, 51 cents, a difference of 30 cents per bale.

LEGISLATION.

National.—The past month has been prolific in proposed new legislation affecting the railroads. Not only does Congress appear to be unusually active along these lines but State legislators are busily engaged formulating laws of a regulative character. At Washington there is an atmosphere of uncertainty manifested, owing to the change of administration, but this has apparently not halted individual efforts to extend the regulation of interstate commerce.

President Taft's veto of the Gillingham-Burnett Immigration Bill is a matter of interest to all railroad officials as the passage of such a bill would undoubtedly have affected the passenger traffic of those roads interested in transporting immigrants to interior points. The bill imposed a literacy test upon all foreigners seeking a home in America and it was this particular limitation that caused the President to veto the entire bill. The veto message was accompanied by a letter to the President from Secretary Nagel, denouncing the literacy test as a radical provision based upon a fallacy in undertaking to apply a test which is not calculated to reach the truth and to find relief for a danger which really does not exist.

The legislation proposed by the Stanley Steel Investigating Committee to regulate switching charges and to prohibit railroads from owning industrial corporations or vice versa, appears to be meeting with considerable opposition and a number of railway officials and others have already appeared before the committee.

It is understood that recommendations in favor of several amendments to the Sherman anti-trust law have practically been decided upon by the Senate Commission on Interstate Commerce. While no definite action is reported, it is understood that the Committee are in substantial agreement for an amendment looking to the maintenance of the principle of competition rather than the regulation of monopoly. There also appears a practically unanimous opinion in support of the contention that the present law, as a whole, should not be disturbed but that changes should be made in the form of supplemental action.

The hearings on the proposed Physical Valuation Bill continued during a large part of the month and are referred to in a more extended manner in another section of this issue. That some legislation of this character will be passed appears certain and a number of the railroad officials who appeared before the committee, spoke in favor of a physical valuation. The bill in question is known as the LaFollette-Adamson Railway Valuation Bill, and directs the Interstate Commerce Commission to investigate and report the value of all the property owned or used by every common carrier. On the 17th of the month this bill was amended so as to cover telegraph and express properties.

The Kenyon Uniform Freight Classification Bill has also been under discussion during the month and objections made to it by railroad officials and others on the grounds that such a classification has already been undertaken by the carriers and is proceeding as rapidly as possible. Just what prompted this attempt at legislation is not clear as it is well understood that the work of the formulation of a uniform classification in which the railroads are now engaged is the result of instructions issued by the Interstate Commerce Commission and appears to be proceeding in a satisfactory manner. Formidable opposition to the bill comes from the National Industrial Traffic League which is urging shippers throughout the country to use their influence to defeat it.

Congressman Peters, of Massachusetts, has a bill pending before the House Committee on Interstate Commerce which provides for the establishment of deputy interstate commerce commissioners in the principal cities or districts of the United States, who shall act as arbitrators between shippers and railroads. It is understood this bill has the approval of the Interstate Commerce Commission and is widely

Digitized by Google

endorsed by Chambers of Commerce and commercial bodies. Congressman Peters has also introduced another bill which proposes to compel railroad corporations to receive their mileage books for transportation on all lines owned or operated by them. This bill has the endorsement of the Commercial Travelers' Association. It is also understood that legislation is soon to be asked by Congress which will empower the Interstate Commerce Commission to send representatives to all meetings of railroad traffic associations and committees.

Two bills affecting operation have been introduced during the month, one by Representative Dent, which provides that it shall be unlawful not later than five years from the date of its passage for an interstate railroad to use any locomotive or car for moving passenger traffic not equipped with some safety device for the prevention of derailment. The bill would permit an increase in passage fares to compensate for the increased safety. Representative Hughs, of West Virginia, has introduced a bill which provides that from and after the first day of January, 1915, it shall be unlawful for any interstate railway to use on its line any passenger, express or baggage car in interstate traffic which is not made of steel. The penalty provided for the hauling of a car not of steel after the prescribed date is $500. The bill further provides, however, that the Interstate Commerce Commission may from time to time, for good cause, extend the period within which any common carrier shall comply with the provisions of the act.

A general investigation of the compensation to be paid railroads by the Government for the transportation of mail has been begun by a joint congressional committee. The railroads are opposed to the payment by space plan which is advocated in some quarters, declaring it would be unfair to the Government and also to the railroads. It has pointed out that such a plan would result in 795 different rates for as many different railroads, and precipitate endless confusion. It was asserted at one of the hearings that under the present system the railroads were actually under paid to the extent of $15,000,000 a year for mail transportation.

The workmen's compensation bill practically unamended, has passed the Senate and has been reported favorably by the House Judiciary Committee. It fixes damages to be paid by corporations for injuries to workmen received in their service without requiring the bringing of suit. Express company employees have been included in the law.

Senator Newlands, an advocate of the no-toll provision of the Panama Canal Bill, has introduced a joint resolution and bill defining the attitude of the United States as to foreign shipping. Under the Newlands bill the portion of the cost of canal operation charged to foreign shipping would be proportionate to the amount of foreign tonnage passing through the waterway.

The River and Harbor Appropriation Bill carrying $40,800,000 has been passed by the House of Representatives without important amendment.

Canada.—Premier McBride has introduced a bill in the British Columbia Legislature to guarantee for the Canadian-Northern Railway an additional $10,000,000 for terminals. The government, in its original bill, dealt with the Canadian Northern and guaranteed the bonds for the main line up to $35,000 per mile from Yellowhead Pass to the Gulf of Georgia. The bill brought down provides for an additional guarantee of $10,000,000 at the rate of 4½ per cent for terminals to be constructed on a vast scale at Vancouver, Port Mann and Victoria, and for a branch line from Port Mann down to a point near Stevenston on the Fraser River.

Colorado.—A bill has been introduced in the Legislature to establish maximum rates and make railway tickets negotiable by legalizing their sale among individuals. The latter provision would permit wholesale ticket-scalping and if passed the carriers declare that they will have no choice but to discontinue all special tourist rates. It is asserted that if these bills pass that the railroads of Colorado would have great difficulty in operating, that stop-overs on east and west travel would be denied in Colorado and that railway construction in the State would be discontinued.

Connecticut.—Government ownership and operation of the New York, New Haven & Hartford Railroad is advocated in a resolution introduced in the General Assembly. The resolution recites that the railroad is the principal means of transportation in the several New England States, and urges that steps be taken immediately "to acquire the New York, New Haven & Hartford road and operate and manage the same and serve the American people, and do the same at cost price."

A resolution favoring Government ownership and operation of the coal fields was also put in. Both resolutions provide for memorializing Congress.

Illinois.—According to information received by Chicago railroad officials, a bill will be introduced in the Legislature within the next few weeks providing for the use of electric headlights on all locomotives operated within the State. It is expected there will be strenuous opposition to such a law, as railroad engineers are of the opinion that a broad measure not specifying a particular kind of headlight, would be preferable.

A bill has been introduced into the State Legislature which provides for a State Board of Control which is to have mandatory jurisdiction over the bond and stock issues of all railroad companies doing business in Illinois. The board is to be composed of the railroad and warehouse commissioners, the Governor, Attorney-General, Secretary of State, State Auditor and State Treasurer. The bill provides that before there can be an increase of capital stock, or a flotation of bonds, or coupon notes, railroad companies must make formal request of this board.

Massachusetts.—A bill introduced by "James Mackaye and another," provides that the State acquire the Boston & Maine through three per cent bonds; that powers of the board be given to the Governor, Railroad Commission chairman and chairman of port directors; that rates and wages be the same as on other roads in North Atlantic States; civil service apply to employees; any direct deficit to be met from

Digitized by Google

bond proceeds, and surplus to be shared between patrons of road, on receipts kept by them, and the employees.

The sub-committee of the Committee on Railroads appointed to re-draft the Washburn mandatory rate bill has had a satisfactory conference with the railroad commissioners and the counsel for the railroads and the street railways. It has left it to Chairman Macleod of the Railroad Commission to undertake to draft a bill that will strengthen that board, so that it can deal with railroad conditions in a way satisfactory to the public.

New Jersey.—The seven corporation bills of Governor Wilson designed to curb trusts have been passed by both houses of the State Legislature. The Democrats united in voting down all amendments offered.

New York.—Assemblyman Levy has introduced a bill giving the Public Service Commission the power enjoyed by the Interstate Commerce Commission to suspend rate schedules filed by railroad companies. The bill is backed by the administration, and the Public Service Commission, Second District, and was drafted by ex-Judge Hale of that commission. A similar bill was passed last year but was vetoed by Governor Dix.

Another bill has been introduced by Assemblyman Jones, which provides a fine for the non-delivery of freight on schedule time. The bill provides that carload shipments must be delivered to the consignee or connecting railroad within a time not exceeding twenty-four hours for every fifty miles of travel.

Pennsylvania.—The new railway law bill which has been introduced in the State Legislature proposes to regulate public service companies at every point including service, equipment, extension as well as stocks and bonds and rates. It is regarded as one of the most comprehensive railway measures ever introduced in a State Legislature.

Texas.—Governor Colquitt has vetoed the bill to permit the merger of the Missouri, Kansas and Texas and the Texas Central Railways. He declares the consolidation unconstitutional.

Vermont.—The State Legislature has killed the bill providing for an interchange of mileage books on Vermont railroads. Notwithstanding the fact that the bill was endorsed unanimously by the recent conference of New England Governors, it lost by a large majority. Governor Fletcher has signed a resolution of the Legislature authorizing the appointment of Vermont's three representatives on the proposed New England railroad conference.

LEGAL.

Government Renews Suit Against Anthracite Carriers.—The Department of Justice has renewed its fight against the anthracite roads by filing in the United States District Court at Trenton, a civil suit against the Delaware, Lackawanna & Western Railroad Company, and the Delaware, Lackawanna & Wesetrn Coal Company, charging violations of both the Sherman anti-trust law and the commodities clause of the Interstate Commerce Act.

The suit represents an effort to dissolve the arrangement made by the railroad in 1890 by which it met the prohibition in the commodities clause against any railroad transporting in interstate commerce coal purchased by it or produced by its mines. The action is therefore a general test of the commodities clause, and shows the intention of the Attorney-General to try out in the government's petition, upon which the Supreme Court of the United States recently handed down a decision, the two charges which were dismissed without prejudice. These related first to alleged violations of the commodities clause and second to alleged violations of the Sherman law through ownership by the Reading Company of the Central Railroad of New Jersey and by the Erie of the New York, Susquehanna & Western.

In its present petition, the government asks that the courts adjudge that the Lackawanna road has not properly divested itself of interest in coal purchased from others or produced by it, that its transportation of this coal, even though title has nominally passed to the coal company, has constituted an unlawful transportation of the commodity. It is also sought to enjoin the defendants from further transporting any anthracite coal which is the product of mines owned by the railroad company or purchased by it from others and sold, transferred or delivered to the coal company in accordance with the standing agreement.

Railroad Heads Plead Not Guilty.—John D. Lindsay, of counsel for President Mellen, of the New York, New Haven & Hartford Railroad Co., and President Chamberlin, of the Grand Trunk Railway Co., of Canada, appeared before Judge Mayer in the United States District Court at New York recently, and entered pleas of not guilty for both of the defendants. In addition, Mr. Lindsay made an application for the appointment of a commission to take testimony from directors of the Grand Trunk Railway and from certain bankers in England as to the reason for the abandonment of work on the Southern New England Railroad extension by the Grand Trunk Railway. Mr. Lindsay also submitted affidavits that the Grand Trunk Railway was committed to improvements to the amount of about $30 000.000 and because of financial stringency in London could not carry out these obligations, including the completion of the Southern New England Railroad route.

Federal Suit Against Erie Railroad.—Attorney-General Wickersham has filed in the Commerce Court a suit against the Erie Railroad, which was alleged to have granted passes to representatives of trans-atlantic steamship companies. The petition of the Attorney-General says:

"True it is that under the proviso in the first section of the act to regulate commerce two carriers subject to the act may interchange free transportation for their respective employees. But the trans-atlantic steamship companies are not carriers subject to the act to regulate commerce. Their entire business is conducted upon the high seas, between ports of the United States and ports in certain European countries. They do not take freight from railroads on through bills of lading, nor are they otherwise

Digitized by Google

associated with any railroad in such a manner that both are under a common control, management or arrangement for continuous carriage or shipment. Consequently the trans-atlantic steamship companies are not carriers within the meaning of section L of the act, and their employees may not lawfully be given free transportation by other carriers which, like the Erie Railroad Company, are subject to its prohibitions."

The Commerce Court has also resumed its hearings in the Tap Line cases. In other cases on the docket, the court took action as follows:

Atchison, Topeka & Santa Fe Railway Company et al. versus United States, Interstate Commerce Commission, et al, interveners, to set aside an order of the Interstate Commerce Commission reducing from $30 to $7.50 per car the charge of refrigeration of citrue fruits where such fruits are pre-cooled and pre-iced by shippers.

George H. Davis, et al., versus United States, respondent, Interstate Commerce Commission, intervener; to set aside an order of the Interstate Commerce Commission prescribing the amount that may be paid by carriers as allowance or compensation for services rendered in the elevation of grain at Kansas City, Mo., and other Mississippi River points, or points in territory adjacent thereto. Dismissed by stipulation without prejudice.

Southern Railway Company, et al., versus United States Interstate Commerce Commission et al., interveners; to set aside an order of the Interstate Commerce Commission prohibiting the petitioners from charging higher rates on freight between Newport News, Va., and points in certain prescribed territory than between Norfolk, Va., and the same points. By agreement of counsel, case was taken under advisement for final determination on the record and arguments heretofore presented upon application for preliminary injunction.

Baggage Liability.—An effort is being made to procure a decision from the Supreme Court of the United States to the effect that the Hepburn Rate Law allows railroads to limit their liability for loss of baggage in return for a low passenger rate. Attorneys for the Oregon Short Line have appealed to the Court from a decision by the Utah Supreme Court. In the case in question, Mrs. Charlotte A. Homer of Salt Lake City, sued for the loss of $700 worth of wearing apparel carried as baggage on a journey from Salt Lake City to Los Angeles. The Utah courts would not permit the railroad to offer in evidence the agreement on the ticket that, in return from the rate at which the ticket was sold, the liability in case of loss of baggage would be limited to $100. The Supreme Court recently decided that such limitations could be placed on freight and express shipments.

Anti-Trust Suit Against Chicago Board of Trade.—The Chicago Board of Trade, in a civil anti-trust suit filed at Chicago by the Government on February 11th, is charged with violating the Sherman law by arbitrarily fixing, during the hours the exchange is closed, the prices of wheat, corn, oats and rye, to be received in Chicago.

The Government's petition in equity asks the United States District Court for a temporary restraining order to be followed, after final hearing, with a permanent injunction prohibiting the fifteen hundred and more members of the Board from continuing an alleged unlawful conspiracy to destroy competition and restrain interstate commerce.

As the Board is open less than four hours, or only one-half of the ordinary business day, it is declared that the prices fixed control the bids of grain dealers for the other half of the business day. The rule has resulted, it is charged, in a conspiracy and combination to prevent competition.

Central Vermont and New Haven Roads Fined under Safety Appliance Act.—A jury in the United States District Court at Boston, has returned a verdict of guilty against the Central Vermont Railway Co., for violations of the Federal Safety Appliance Act. There were three counts in the information prosecuted by Assistant United States District Attorney Garland, and the penalties aggregate $300.

There was a verdict also against the New Haven Railroad Co. for similar offenses carrying with it penalties of $300. Both verdicts were directed by the court.

Heavy Fines for Rebating.—Harold R. Wakem, representing Wakem & McLaughlin, forwarding agents at Chicago, who recently pleaded guilty of accepting rebates from the Chesapeake & Ohio Railroad, has been sentenced by the Federal District Court at New York to one day's imprisonment and a fine of $1500. William L. Divine foreign freight agent of the Chesapeake & Ohio Railroad, who paid the rebates, was fined $15 000.

Alaska Carriers' Case Protested.—The Department of Justice is making a vigorous protest to the Supreme Court against the decision of the United States District Court for Alaska which set aside indictments against an alleged Alaskan "transportation trust." The ground is taken that before the Federal Government could indict for alleged transportation discriminations, the questions must be passed upon by the Interstate Commerce Commission. The issue is new and regarded as extremely important.

Commodities Suit Dropped.—The United States District Court at Philadelphia has dismissed without prejudice the amended bill of complaint filed by the Federal Government under the commodities clause of the Hepburn Railroad Act against the Lehigh Valley Railroad. The Government, in the bill, sought to bring about a complete separation of the Lehigh Valley Railroad Company from the production and sale of anthracite coal.

The action of the Court was in accord with an agreement reached between J. C. McReynolds, of New York, special assistant to the Attorney-General, and counsel for the railroad company.

Government Opposes Modification of Coal Trust Decision.—Briefs have been filed in the United States Supreme Court by several anthracite railroads in support of their motion for a modification of the court's decision in the

Digitized by Google

anthracite trust case. The motion and grounds therefor were set forth by Dow, Jones & Co., January 22d. The court ordered all of the 65 per cent contracts canceled. The defendant roads ask that such contracts with the lessees of coal lands owned by the railroads or by coal companies controlled by the railroads be excepted. They argue that as the carriers originally owned the lands and their coal contents, these contracts could not be any part of a conspiracy to restrain trade or monopolize production. The contracts are incorporated in the leases and their cancellation would force the lessees to make new arrangements or go out of business. The lessees are said to have asked for the modification.

Replying to the brief of the coal companies, the Government opposes all modifications except in the case of the contract between the Pennsylvania Coal Co. and the Elk Hill Coal & Iron Co.

Grand Trunk Seeks Dissolution of Southern New England.—The Grand Trunk Railway has filed in the Superior Court, at Concord, N. H., a bill in equity to test the legality of the incorporation of the Southern New England Railway Company. The bill quotes the articles of incorporation filed with the Secretary of State and says that what purports to be the signature of the Grand Trunk by Charles M. Hays, president, is not the legal and binding signature of the Grand Trunk, but was his unauthorized act, that it was beyond the power of the company to bind itself to the purchase of the shares of the capital stock of the alleged railroad, and that the act therefore is null and void.

The present action affects only the proposed extension to parallel a section of the line of the Boston & Maine in New Hampshire.

ORGANIZATIONS.

Candidates of the Traffic Club of Chicago for 1913.—The Nominating Committee has announced the following Regular Ticket to be voted on at the annual election of the Traffic Club of Chicago, Tuesday, March 25th:

President, Guy S. McCabe, general western agent, Pennsylvania R. R.; secretary, W. H. Wharton, commercial agent, N. C. & St. L. Railway; treasurer, Chas. B. Kopper, general freight agent, Goodrich Transit Company; first vice-president, W. M. Hopkins, manager transportation department, Board of Trade; second vice-president, Frank W. Smith, member, Uniform Classification Committee; third vice-president, L. Richards, traffic manager, Quaker Oats Company.

Millers Oppose Milling-in-Transit Rule.—At the recent annual convention of the Wisconsin State Millers' Association much opposition was developed to the rule governing "milling-in-transit" as made by the Interstate Commerce Commission. The millers assert they cannot work under the rule.

Officers chosen were: President, R. E. York, Portage; vice-president, H. F. Gustavus, Oshkosh; secretary-treasurer, E. J. Lachmann, Neenah.

February Meeting of New York Railroad Club.—The February meeting of the New York Railroad Club was held in the building of the United Engineering Societies, on Friday evening, February 21st, and was devoted to further promotion of the Safety First campaign, which has been a subject of such widespread interest in the United States. The paper for the evening was by Mr. J. W. Coon, of Baltimore, assistant to the general manager of the Baltimore & Ohio Railroad and chairman of the General Safety Committee of that road. It was supplemented by lantern slide illustrations by C. W. Egan, general claim agent of the B. & O. Prominent railroad officials participated in the formal discussion of the subject.

Annual Dinner of Philadelphia Traffic Club.—The principal speaker at the annual dinner of the Philadelphia Traffic Club, held on the evening of February 1st, was J. C. Clements, of the Interstate Commerce Commission. He declared that: "No one will deny that the Interstate Commerce Commission law and its various amendments have proven a benefit to the railroads and shippers alike; even those who at first vigorously opposed the power of regulating rates are now among the warmest supporters of the commission." Mr. Clements traced in detail the history of the commission. Other speakers included W. H. Manss, formerly traffic manager of the Chicago, Burlington and Quincy Railroad.

Y. M. C. A's. to Aid Safety Movement.—As a result of a conference held at the headquarters of the Traffic Club of Chicago, the railroad department of the Chicago Y. M. C. A. will cooperate in the "safety-first" movement on various railways throughout the country.

Among those present at the meeting were R. A. Richards, in charge of the safety campaign on the Northwestern line; L. F. Shedd, chief of the safety department of the Rock Island System, and W. N. Northcott, railroad secretary of the Y. M. C. A. in Chicago. It is proposed that directors of safety campaigns on various railways shall write one or more lectures on the "safety habit" and that these shall be delivered at stated intervals before meetings of railway employes.

A lecture appealing especially to the general public also will be prepared. Each lecture will be illustrated either with moving pictures or stereopticon views. A number of the meetings will be held under the auspices of the Y. M. C. A.

A special effort will be made to place emphasis on the dangers attendant upon trespassing. The Chicago branch of the Y. M. C. A. is the first in the United States to arrange for co-operation with rail lines in lessening accidents.

Electrification of New Haven Lines.—In a recent address before the Foxboro (Mass.) Board of Trade on "The Building up of the New England Lines," Albin L. Richards of the New Haven said that four-track electrification between Boston and Providence by 1915 and extension through from Boston to New York, are intended improvements by the management of the New Haven.

From New York to New Haven, he stated,

Digitized by Google

the work of electrification is nearly completed and between Providence and Boston it has been authorized. The engineering is under way and the area of construction begun. The bill for permission to make the improvement from Boston eastward is before the Legislature.

Railway Appliance Exhibit.—Announcement has been made that the annual exhibition of the National Railway Appliances Association will be held in connection with the convention of the American Railway Engineerig Association in Chicago, March 15th to 21st next. Both the Coliseum and the First Regiment Armory have been leased to provide for the requirements of the exhibitors. Most of the space already has been allotted.

To Reduce Mistakes in Shipping.—A sub-committee of the committee on ways and means of the Chicago Association of Commerce soon will be organized for the purpose of suggesting means whereby the improper marking of freight and careless methods in packing commodities intended for shipment can be reduced to a minimum. A number of railroads will be represented on the sub-committee.

Lake Carriers' Association Elections.—William Livingstone, of Detroit, has been re-elected president of the Lake Carriers' Association. All of the other officers have been named to serve again. New members of the Board of Directors are: W. Thomson and H. K. Oakes, Cleveland; Joseph B. Rodgers, Buffalo, and L. C. Waldo, Detroit.

G. A. Tomlinson, of Duluth, has been placed on the Executive Committee, to succeed the late J. J. H. Brown.

Nineteen vessels were lost on the great lakes last year, the president reported, and thirty-three persons were drowned or killed.

Annual Meeting of East St. Louis Relay Passenger Station Association.—At the annual meeting of the East St. Louis Relay Passenger Station Association, the election of officers resulted as follows: John Fitzgerald, superintendent terminals, Louisville and Nashville Railroad, was re-elected president. George W. Parker, of the Illinois Central Railroad, was re-elected vice-president. The following Executive Committee was elected: George W. Parker, general agent, Illinois Central Railroad; A. M. Schoyer, general manager, Vandalia Railroad; Henry Miller, general manager, Wabash Railroad.

The president re-appointed Mr. F. G. Cunningham as joint agent and station master. Plans for the improvement of the Relay Station, including a subway and the enlargement of all facilities on the train platforms, new restaurant and waiting rooms, lavatories, parcel room, etc., have been approved by the Commercial Club and are awaiting the final approval of the Illinois Railroad and Warehouse Commission.

Lumber Dealers Attack Parcel Post.—At the annual meeting of the Retail Lumber Dealers' Association, held in Pittsburgh, during the first week in February, the speakers criticised the parcel post, the mail-order lumber business and the delay in railroad freight shipments. A. L. Holmes, of Detroit, Mich., a director of the National Federation of Retail Merchants, said that no more money should be "wasted on the parcel post"; it was being tried as an experiment by the Post Office Department at a cost of $750,000. He said the system was a failure and was of no help to the retailer. A ship canal for the Ohio River was advocated.

New York Bar Association Favors Canal Arbitration.—At the 36th Annual Convention of the New York Bar Association held recently in Utica, N. Y., the following resolution was adopted:

Resolved, That we reiterate our adherence and devotion to the principle of international arbitration as heretofore announced by this association, and cordially approve the position of President Taft on the Panama question as stated in his speech of January 4th, and quoted in Mr. Butler's minority report.

Notable Dinner of Pittsburgh Traffic Club.—The annual dinner of the Pittsburgh Traffic Club, held on the evening of the last day of January, was in many respects the most notable banquet ever given by that organization. The speakers, whose remarks are referred to at greater length in another section of this issue, were Prof. Emery R. Johnson, of the University of Pennsylvania, and Arthur Brisbane, editor-in-chief of the Hearst newspapers. The guests comprised men prominent in railway, industrial and political life. George A. Post, president of the Railway Business Association was toastmaster.

Samuel Gompers on Arbitration.—Samuel Gompers, president of the American Federation of Labor, told the members of the National Civic Federation at the last session of their annual meeting that the workers of the United States would fight before they would accept such compulsory arbitration laws as have been proposed in legislative bills at Albany.

Mr. Gompers declared that the workingmen of the country would, under no conditions, consent to the enactment of laws which would curb or prevent their right to stop work when they chose. While agreeing that the prevention of strikes was highly desirable, he cautioned the Federation against falling into the error of believing that such disturbances could be escaped by curtailing rights and attempting to make natural activities unlawful.

In reply to a question from Marcus M. Marks, chairman of the conference, Mr. Gompers said that he confined his strictures entirely to compulsory arbitration, and that he approved highly of arbitration provided it could be voluntary.

The conference elected Miss Maude Wetmore, president of the women's department; Seth Low, president, and Samuel Gompers, John Hays Hammond, Benjamin Ide Wheeler, vice-presidents of the executive council; President Taft, Franklin MacVeagh, Elihu Root and Andrew Carnegie to represent the public on the executive committee; William D. Baldwin, William C. Brown, George B. Cortelyou and Samuel Mather of Cleveland, to represent the employers; Samuel Gompers, Warren S. Stone, of Cleveland; James M. Lynch, of Indianapolis; A. B. Garretson, of Cedar Rapids, Ia.; W. G. Lee, of Cleveland; William D. Mahon, of Detroit; W. S. Carter, of

Digitized by Google

Peoria, Ill.; and others to represent the wage-earners.

The Santa Fe's Reading Rooms.—The Atchison, Topeka and Santa Fe has, during the past few years established five combined reading rooms and club houses and thirteen single reading rooms along the lines of its system. The cost of operating these rooms is about $25,000 a year, apart from renewals and the purchase of books and papers. The yearly cost of papers is about $2,500, and a similar amount is spent for books. The expense of putting on entertainments during the season of six months is about $8,000. The complete cost involved for a year's operation is $50,000.

The Santa Fe has found these club houses and reading rooms of great benefit to the men both morally and intellectually and they have undoubtedly proved an important factor in increasing their friendliness towards the Company which they serve. The following is the motto which has been adopted for all Santa Fe reading rooms:

"Give a man a bath, a book and an entertainment that appeals to his mind and hopes by music and knowledge, and you have enlarged, extended and adorned his life; and, as he becomes more faithful to himself, he is more valuable to the company."

Annual Dinner of Chicago Traffic Club.—The Sixth Annual Dinner of the Traffic Club of Chicago, held in Hotel La Salle Banquet Hall, Tuesday evening, January 28th, was the greatest ever given in the history of the organization, and in the opinion of impartial observers one of the greatest ever given by any Traffic Club. The total attendance was 640, including many distinguished railroad and industrial officials from all parts of the country.

The toastmaster was Mr. George A. Blair, general traffic manager, Chicago & Alton R. R., and the speakers were Col. J. Hamilton Lewis and Wilbur D. Nesbit of Chicago and John H. Atwood of Kansas City. Seated at the speakers' table were:

Edward S. Keeley, vice-president, Traffic Club of Chicago; Roger Sullivan, Chicago, Ill.; A. W. Goodrich, president, Goodrich Transit Co.; E. J Buffington, president, Illinois Steel Co.; S. M. Felton, president, C. G. W. Railroad; John Maynard Harlan, Chicago, Ill.; J. M. Fitzgerald, president, Western Maryland Railway; F. B. Montgomery, president, Traffic Club of Chicago; A. J. Earling, president, C. M. & St. P. Railroad; Howard Elting, president, Chicago Association of Commerce; Fairfax Harrison, C. I. & I. Railway; Charles H. Wacker, president, Chicago Heights Land Association; B. A. Worthington, president, C. & A. Railroad; J. P. Ramsey, president, C. P. & St. L. Railway; C. W. Hotchkiss, president, Illinois Telephone & Telegraph Company.

The addresses made have been widely quoted in the press and were notable efforts in every respect and worthy of the great occasion.

Chicago Office for National Industrial Traffic League.—At the annual meeting of the National Industrial Traffic League, held at Chicago, Illinois, November 14th, 1912, the question of increasing the efficiency of the League was considered, and the report of the Finance and Auditing Committee, recommending the appointment of a paid official to carry on the work of the League, was approved.

Pursuant to this action, the Executive Committee has opened headquarters, as the office of the secretary-treasurer, at Room 413, Tacoma Building, 5 No. La Salle Street, Chicago, Illinois, and has engaged Mr. D. P. Chindblom, as assistant secretary, in charge of the office.

Shippers throughout the country are being urged by the National Industrial Traffic League to use their influence toward preventing the passage by Congress of what is known as the uniform classification bill.

A statement issued by the league relative to the proposed law says:

"We fear a legislative-made classification would be too rigid and not sufficiently flexible to meet the varying conditions existing in different territories and constantly arising under the varying demands of commerce. We believe the right of initiative in the making of the classification of freight should continue with the carriers through a proper body constituted for that purpose; that the work of the classification committee, or committees, should be subject to review upon formal complaint as to any specific item or items, or, upon its own initiative, by the Interstate Commerce Commission as now authorized by the act to regulate commerce."

ELECTIONS AND APPOINTMENTS.

Executive.

H. M. Atkinson, receiver, Atlanta, Birmingham & Atlantic.

E. F. Bisbee, vice-president, St. Louis National Stock Yards. Headquarters, National Stock Yards, Ill.

W. F. Bull, director, Southern Pacific Railroad.

D. L. Bush, vice-president, Chicago, Milwaukee & St. Paul. Headquarters, Chicago, Ill.

E. J. Chamberlin, president, Central Vermont. Headquarters, Montreal, Que.

E. A. Chittenden, member of executive committee, Central Vermont.

H. W. DeForest, member, executive committee, Texas & New Orleans Railroad.

E. Dickinson, president and director, K. C. M. & O., of Texas.

Bruce W. Duer, vice-president in charge of operation, Georgia & Florida. Headquarters, Augusta, Ga.

Dewey Dunn, receiver, Scott City Northern.

Raymond Dupuy, president, Norfolk and Western Ry.

H. B. Earling, vice-president, Chicago, Milwaukee & St. Paul. Headquarters, Seattle, Wash.

C. B. Ferry, assistant to vice-president, Chicago, Milwaukee & St. Paul. Headquarters, New York.

C. A. Goodnow, assistant to president, Chicago, Milwaukee & St. Paul. Headquarters, Chicago.

Jerome D. Greene, member of executive committee, Western Maryland.

William A. Harriman, director, Union Pacific Railway.

W. E. Higgins, acting vice-president and general manager, Lackawanna & Wyoming Valley. Headquarters, Scranton, Pa.

Digitized by Google

G. C. Jones, vice-president, in charge of construction, transportation and maintenance departments, Central Vermont. Headquarters, St. Albans, Vt.

J. A. Jordon, acting president, Green Bay & Western Railroad.

M. C. Kennedy, director, Norfolk & Western.

Julius Kruttschnitt, chairman of executive committee, Texas and New Orleans Railway.

E. T. Lamb, receiver, Atlanta, Birmingham & Atlantic.

A. D. McDonald, deputy comptroller, Southern Pacific. Headquarters, San Francisco, Cal.

Lawrence Minot, director, New York, New Haven & Hartford. Headquarters, Boston, Mass.

F. W. Mohr, director, Southern Pacific Railroad.

Charles H. Morey, receiver, Manistee & Grand Rapids. Headquarters, Manistee, Mich.

N. J. O'Brien, vice-president and general manager, K. C. M. & O. of Texas.

George L. Peck, fifth vice-president, Pennsylvania Lines West of Pittsburgh. Headquarters, Pittsburgh, Pa.

W. H. Penfield, assistant to vice-president D. L. Bush, Chicago, Milwaukee & St. Paul Railway.

J. B. Rider, director, Pressed Steel Car Company. Headquarters, Pittsburgh, Pa.

C. B. Seger, vice-president and comptroller, Union Pacific. Headquarters, New York.

Edmound D. Sewall, vice-president, Chicago, Milwaukee & St. Paul. Headquarters, Chicago, Ill.

E. T. Smith, member of executive committee, Central Vermont.

Lewis J. Spence, director, Southern Pacific Company.

Percy R. Todd, president, Bangor & Aroostook. Headquarters, Bangor, Maine.

Frank Trumbull, director, Union Pacific Railroad.

W. H. Wadden, vice-president, Denver, Northwestern & Pacific Railroad.

W. H. Wagner, receiver, Scott City Northern.

H. V. Wallace, co-receiver with the Continental Trust Company, Denver, Colo., of the Denver, Laramie & Northwestern.

J. N. Wallace, member of executive committee, Texas and New Orleans Railway.

A. R. Whaley, vice-president in charge of operation, New York, New Haven & Hartford. Headquarters, New York.

Charles A. Wickersham, president, Georgia Railroad.

John Skelton Williams, chairman board of directors, Georgia and Florida.

R. Lancaster Williams, president, Georgia & Florida. Headquarters, Richmond, Va.

W. A. Worthington, director, Southern Pacific Railroad.

Financial.

C. B. M. Craig, chief engineer, Midland Continental Railroad.

Charles H. Moore, principal assistant engineer, Erie Railroad.

H. J. Osborne, master mechanic, Louisiana Division, Chicago, Rock Island & Pacific Railway.

Charles Stake, engineer, Pennsylvania Lines.

"Dan" Tuttle, veteran passenger engineer, Chicago & Northwestern.

Operation.

W. E. Brown, superintendent, Missouri, Kansas & Texas.

W. E. Costello, superintendent, Southern Division, Central Vermont.

G. E. Coutant, superintendent of motive power and machinery and master car builder, Ann Arbor Railroad.

C. S. Cunningham, superintendent, Detroit Division, Grand Trunk Railway.

W. H. DeFrance, general superintendent, Louisiana Southern.

J. A. Emmart, assistant general manager, Coal & Coke Ry.

J. H. Hargraves, yardmaster, Kansas City Southern.

Hans Helland, superintendent of maintenance of way, San Antonio & Aransas Pass.

E. S. Heyser, traimaster and roadmaster, St. Louis, Brownsville & Mexico Railway.

W. D. Holliday, general superintendent, Ann Arbor.

A. L. Kuykendall, assistant superintendent, Texas & New Orleans and the Galveston, Harrisburg & San Antonio.

F. W. Mahl, assistant to director of maintenance and operation, Union Pacific.

W. C. Mann, general yardmaster, I. & G. N.

Y. M. Martin, trainmaster, Missouri, Kansas & Texas.

Arthur O'Leary, chief despatcher, the Katy.

Charles W. Pifer, roadmaster, Minnesota Division, Illinois Central.

B. R. Pollock, general manager, New York, New Haven & Hartford Railroad Company.

Digitized by Google

T. C. Radley, superintendent, Gulf Division, International and Great Northern Railway.
C. E. Soule, superintendent, Northern Division, Central Vermont.
Virgil Walker, superintendent, Norfolk Southern.
A. R. Whaley, general superintendent of electric division, New York Central & Hudson River.
W. A. Worthington, assistant director of maintenance and operation, Union Pacific.

Traffic.

D. D. Allerton, agent, Erie.
W. S. Basinger, assistant to director of traffic, Union Pacific.
C. N. Bell, claim adjuster, Rock Island Road.
A. H. Bolte, claim agent, Rock Island Road.
M. Corcoran, traveling passenger agent, Grand Trunk, Kansas City territory.
D. M. Cosgrove, agent, Lehigh Valley Railroad.
W. A. Cox, general freight agent, Western Maryland. Headquarters, Pittsburgh, Pa.
G. Craig, division freight agent, Chesapeake & Ohio.
W. G. Crutchfield, commercial agent, the Southern.
M. W. Dunbar, agent, Lehigh Valley Railroad.
A. S. Gary, division freight agent, Virginia Division, Chesapeake & Ohio.
G. Gillespie, joint ticket agent, Cotton Belt, I. & G. N., H. & T. C., G. C. & S. F., S. A. & A. P.
O. R. Hartom, agent, Lehigh Valley Railroad.
J. H. Hodges, general freight and passenger agent, Apalachicola Northern.
Charles N. Laney, traffic manager, Toledo, Bowling Green & Southern.
J. W. McCann, commercial agent, Frisco at New Orleans.
E. McGraw, live stock agent, Toledo, St. Louis & Western.
C. N. McNulty, soliciting freight agent, Georgia, Southern & Florida.
B. P. Miller, commercial agent, Georgia, Southern & Florida.
F. W. Miller, commercial agent, Chesapeake & Ohio and the Chesapeake & Ohio of Indiana.
W. E. Miner, traffic manager, Hannibal Connecting Railroad.
R. E. Phillips, traveling freight agent, Macon, Dublin & Savannah.
F. H. Plaisted, assistant to director of traffic, Union Pacific.
W. H. Post, agent, Lehigh Valley Railroad.
D. I. Roberts, general freight and passenger agent, Quebec, Montreal & Southern.
W. G. Rogers, traveling freight agent, Illinois Central.
W. L. Sarhgent, traveling immigration agent, Gould Lines.
D. M. Saunders, special claim agent, Southern Railway.
H. G. Shelby, commercial agent, Chicago, Milwaukee & Puget Sound.
L. J. Spence, director of traffic, Union Pacific.
L. A. Vanduyne, agent, Lehigh Valley Railroad.
R. E. Watson, traveling freight and passenger agent, Illinois Central.
J. R. Wood, passenger traffic manager, Pennsylvania Railroad.

Purchasing.

E. L. Leitch, chief clerk to general storekeeper, C. G. W. R. R.
J. E. Mahaney, general storekeeper, Oregon-Washington Railroad & Navigation Company.
W. V. S. Thorne, director of purchase, Southern Pacific.

Miscellaneous.

Henry L. Gray, engineer, Public Service Commission, Tacoma.
James W. Whitford, wage bonus supervisor, Santa Fe.

OBITUARY.

Albert S. Cheever.

Albert S. Cheever, former superintendent of the Fitchburg Division of the Boston & Maine Railroad, died suddenly at his home, 6 Aldersey Street, Somerville, this morning. He was born in Chelsea, September 17, 1857.

At an early age, Mr. Cheever entered the employ of the Fitchburg Railroad as an engineer. He was later made road master and was then promoted to chief engineer, which position he held up to the time of the consolidation in 1900.

In 1901 he was made superintendent of the Fitchburg Division of the Boston & Maine, which position he held until a few months ago, when he became assistant to the vice-president of the road.

J. T. Mason Barnes.

J. T. Mason Barnes, who died on January 28th, at his home in Baltimore, Md., was secretary and treasurer of the Western Maryland from 1896 to 1902, and then was assistant secretary and treasurer. On October 16, 1912, he was retired on an annuity.

Stephen S. Palmer.

Stephen S. Palmer, president of the St. Louis & Hannibal, the Green Bay & Western, the Ahnapee & Western, the Kewaunee, Green Bay & Western and the Iola & Northern railways, also a director in various banking, gas, electric, insurance and manufacturing companies, with headquarters at New York, died on January 28th, at Redlands, Cal., at the age of 60.

Joseph W. Gilluly.

Mr. Joseph W. Gilluly, treasurer of the Denver & Rio Grande R. R., died February 6th, at Denver, Colo., of heart failure following an attack of Bright's disease. He was born at Shrewsbury, N. J., in 1851.

Thomas P. Bonfield.

Mr. Thomas Philip Bonfield, president of the Kankakee & Seneca R. R. and a director of the Chicago, Rock Island & Pacific Ry., and the

Digitized by Google

Cleveland, Cincinnati, Chicago & St. Louis Ry., and nestor of the Kankakee Bar Association, died January 21st, at Kankakee, Ill., after a lingering illness with bronchitis.

Fred C. Hudson.

Fred C. Hudson, general attorney for the Iron Mountain for the State of Louisiana, with headquarters at Monroe, died at Hot Springs, Ark., on January 17th. Mr. Hudson had been in ill health for over two years. He was general solicitor for the Houston, Central Arkansas and Northern when the road was purchased by the Iron Mountain about twenty-five years ago. He was then made general attorney in Louisiana for the Iron Mountain and continued to hold that position up to the time of his death. He also represented in Louisiana the Gould estate, which holds large land, timber and other interests there.

John Fritz.

John Fritz, the veteran iron and steel master, died in Bethlehem on February 12th. Mr. Fritz was in his 91st year and he had been in ill health for several months. He was a Chester County farmer's son and he began his industrious life when he was very young and at the age of ten or twelve years was doing a man's work in the farm. He drifted into blacksmithing 75 years ago but began the labor of his life at Moore & Hoovens rolling mill in Norristown in the early 40s.

He soon became superintendent, succeeded to the management of the Cambria Iron Company, and in 1860 became connected with the Bethlehem Iron Works, now the Bethlehem Steel Company. Mr. Fritz was the best known iron man in this country and he was honored by our own and foreign mining, civil, electrical and mechanical engineering societies and received several degrees from colleges. He was a trustee of Lehigh University and built the John Fritz Laboratory, and the Fritz Memorial Church to his mother in South Bethlehem.

S. S. Palmer.

S. S. Palmer, president of the Green Bay and Western Railroad Company, died in California on January 30th. He had been in failing health for about a year. J. A. Jordon, vice-president of the road, becomes the nominal head.

Charles A. Beach.

Charles A. Beach, president of the Catskill Mountain Railway, died in Catskill, N. Y., on January 16th. He was seventy years of age, having been born at Catskill in 1843. In 1880 he helped locate the route of the Catskill Mountain Railway. He was superintendent of the line from 1882 until 1885, when he became general superintendent and secretary. A few years ago he became president. For three years before 1880 he was in the steamboat business on the Hudson River and for twelve years he was proprietor of a stage line in the Catskills. He was also secretary and treasurer of the Otis Railway. Mr. Beach is survived by his wife, who was Mabel Wilson.

William G. Raoul.

William Green Raoul died at Atlanta, Ga., on January 17th. During the Civil War he was captain in the Confederate Railway Bureau, in charge of the car construction and transportation of army supplies. In later years at different times Captain Raoul held the presidency of the Central of Georgia, Mexican National, and Atlanta, Birmingham & Atlantic Railroads.

T. W. Roby.

T. W. Roby, comptroller of the Seaboard Air Line Railway, died in Norfolk, Va., on February 7th, following a stroke of apoplexy.

TRAFFIC.

February Movements.—February presents a favorable record of traffic movements throughout the country. While freight was moved promptly and the car situation was in the main, satisfactory, the railroads had all they could comfortably handle. The open winter has proved of the greatest assistance in the prompt movement of freight and in many sections the railroads have experienced less difficulty and congestion than they have for years in spite of the fact that they have in many instances been handling a record tonnage. Not only has the general merchandise movement been in large volume but the continuous movements of grain during the past four or five months has probably been the largest that has ever occurred to a like period and there has been no week during this period when grain receipts at terminal markets have fallen below 20,000,000 bushels while at times they have risen as high as 90,000,000. One of the striking features of the situation is the long haul business being secured by the railroad. There has been somewhat of a general complaint of a shortage of box cars through the leading grain producing States, particularly in Minnesota and the Dakotas but this condition has not reached near the proportions of previous years.

The possible influence of the Panama Canal upon established traffic routes continues to be a question of large interest to railroad officials. That the Southern ports expect to reap a rich harvest after the opening of the canal is evidenced by the great activities looking to terminal improvements which are in evidence at many such ports. At Pensacola, Fla., for example, extensive preparations are being made for increased ocean traffic. One pier 1,225 feet in length has recently been completed and four more are planned for the immediate future, while details for one 2,700 feet long are being worked out. Other cities are showing a like appreciation of the advantages which are likely to be secured by those ports who are prepared for the anticipated increased traffic.

From the Pacific Coast comes reports that a large part of the fruit traffic from California, that has been handled by the trans-continental lines, may go by water to New Orleans for distribution into Missouri River and Mississippi Valley territory. The suggestion is that much of it may be transported in refrigerator ships, but it would appear that, owing to the much

Digitized by Google

greater length of time consumed in making the water haul, that the trans-continental lines will retain an advantage hard to overcome so far as the transportation of perishable products are concerned.

The parcel post experiment continues a matter of great interest and is being watched closely by government, railroad and express officials. It is discussed at greater length in another section of this issue. It has so far shown a surprising vitality and from the number of packages carried during the first month, it would appear that it is being utilized to a large and general extent. It remains to be seen that whether, after the public becomes as familiar with its shortcomings as with its advantages, they will still continue to favor it over the express companies' service.

An interesting annual summary of ship building in the United Kingdom and other countries for the year of 1912 issued by Lloyd's Register of British and foreign shipping, shows that during that year a total number of 1,151 vessels were built with a tonnage of 1,506,174 tons. This is considerably in excess of the number and tonnage for 1911. The United Kingdom, as usual leads, representing, in tonnage, considerably more than half of the world's entire activities along these lines. It is reported that the shipping trade continues brisk and that there is no outlook for any immediate let-up.

Tourist Rates.—Summer tourist rates to the West for the coming season, have been placed upon the same basis as last year.

From Chicago to Colorado common points the round trip fare will be $30, and to Utah points the rate for the round trip journey from Chicago will be $43. To California the round trip charge will be $72.50 for tickets on sale every day and $65 for periods during which conventions will be held on the coast.

It is also reported that the Central Passenger Association has decided to inform applicants for low rates to conventions to be held during the present year, that a fare of two cents a mile in each direction will be quoted. This is the rule which has been in force for some time.

Texas Lumber Shipments.—An extraordinary movement of lumber through Texas City and Galveston has been going on during the last few weeks. Reports from Galveston are to the effect that the Mallory and Morgan Lines and Texas City Steamship Company are sending out on every steamer practically all the lumber they can take care of along with their other business. So far this season the Texas City steamship line steamers have carried approximately 17,000,000 feet of lumber to North Atlantic ports, and there is now in sight about 16,000,000 feet. The movement of lumber to Mexico also has been large. Port Bolivar, Sabine and Port Arthur have also been receiving large quantities of lumber for movement to North Atlantic and Mexican ports. Another feature of the year's lumber movement has been shipments to Panama.

Immigrant Traffic.—Figures just compiled by the Immigrant Bureau lines show that during the first eleven months of 1912 a total of $1,062,158 revenue accrued to these lines on the immigrant traffic, compared with $1,030,160 for the preceding year, a gain of 3.11 per cent. The figures for the eleven months of 1911 was 12.04 per cent under 1910, which in turn was 1.44 per cent over 1909. That year, however, showed an increase of 90.13 per cent over 1908.

At the North Atlantic Steamship conference which met in Berlin on January 30th, the Canadian Pacific Railway refused to join in the regulation pool which has been enforced for a number of years. The other members unanimously decided to renew the combination. This action on the part of the Canadian Pacific was foreshadowed by its recent stand in connection with immigrant business and the efforts which it is to put forth to induce a large number of immigrants to settle in the Canadian northwest. It evidently desires no restrictions placed upon its efforts along these lines.

Reduction in Pittsburgh Coal Rates.—A freight rate has been established on coal from the Pittsburgh District that will permit competition on a more even basis with other coal fields in the seaboard coal markets and particularly for the export coal trade. The new charge established jointly by the New York Central and the Western Maryland gives a net rate of $1.43 a gross ton to Baltimore docks, when the consignments of coal ore for points beyond the Baltimore local market. This rate has been enjoyed by the Fairmont, Pocahontas and New River District operators of West Virginia, and represents a reduction of 15 cents a ton for the Pittsburgh District.

LAND AND INDUSTRIAL.

Additional Commissioner of Agriculture for the Missouri Pacific System.—The Missouri Pacific-Iron Mountain has added another commissioner of agriculture to its force. Heretofore, Mr. L. A. Markham, with headquarters at Little Rock, Ark., has been commissioner of agriculture for the system. He will remain commissioner of agriculture for the Iron Mountain Lines and retain his headquarters at Little Rock, but Mr. George K. Andrews has been appointed commissioner of agriculture with supervision over the lines of the Missouri Pacific proper. His headquarters will be in St. Louis.

Mr. Andrews is a man who has made a very thorough study of scientific farming and agriculture for a number of years. His addition to the force of the Missouri Pacific is in keeping with the policy of President B. F. Bush, to help improve agricultural conditions along the tracks of the company by teaching the tillers of the soil scientific methods of farming and conserving moisture.

J. J. Hill to Start Farmers' Bureau.—An agriculture department is to be started in connection with the First National Bank of St. Paul lately taken over by the Hill interests. The department will take the form of a daily information bureau for farmers throughout the entire Northwest, and information will be given on practically all branches of farming. The bureau will be second in size only to that of the United States.

It is still understood that Mr. Hill's plans include lending money to farmers at lower rates than are now being paid.

Digitized by Google

Canadian Pacific's Colonization Plans.—J. S. Dennis, assistant to the president, of the Canadian Pacific Railway, has returned from his recent visit to Europe where he was engaged in work the object of which is to obtain new desirable colonists for Canada. During his stay in London, Mr. Dennis addressed the Royal Colonial Institute on the subject of "Land Settlement Within the Empire," and he took advantage of the occasion to give a description of the new policy of the Canadian Pacific Railway under which the company is disposing of the remaining portion of their land grant for colonization purposes solely. This remarkable liberal policy, which is considerably in advance of anything heretofore attempted, attracted widespread and keen attention, being dealt with at great length by the press of the United Kingdom and also by many Continental papers. In the course of his address, Mr. Dennis emphasized the important fact that it is not possible to obtain from the United Kingdom any very large number of agricultural colonists for any of the oversea domains, the reason being that the agricultural population of the United Kingdom is now very limited, less than 13 per cent of the total population, or about 1,000,000 males, or 240,000 families in Great Britain and Ireland being engaged in agriculture and living on the land.

With all the overseas domains actively competing for a share of these colonists the proportion which any one can obtain is necessarily limited. Mr. Dennis utilized these facts as a basis for the argument that if colonization is to progress as steadily in Canada a large portion of the agricultural immigrants must be secured from northern Europe and from the United States.

Mr. Dennis intimated that vigorous efforts were to be made by his road to induce immigration to Canada from the United States. He stated that Canada supplies better prospects of financial success, a lower rate of taxation and as good or better school systems and a respect for law and order, such as is not found anywhere in this country.

Railroads Assisting Farmers in the Middle West.—Bankers and railroads of this section are actively engaged in promoting the adoption of better farming methods. In a number of countries in Missouri and Kansas, bankers are forming organizations for the purpose of establishing county bureaus of agriculture and employing experts to advise farmers in their work. The Rock Island and Santa Fe have agreed to pay four-fifths and the United States Department of Agriculture one-fifth of the salary and expenses of two farm demonstration agents to be stationed in Western Kansas, where there is serious need of a change in the system of farming now practiced.

The Missouri Pacific has established three experimental farms in Arkansas and two in Louisiana, and will start a sixth soon in Southern Missouri. A chain of experimental farms may be established along its entire system if those now conducted prove successful. The Rock Island is running more special farm demonstration trains than any other railroad in the Southwest.

Establishing Polish Settlers in the South.—Announcement has been made by the management of the Illinois Central Railroad that a colony of Polish farmers will be established within a year on an old southern estate known as Brandon Hall, located eleven miles east of Natchez, Miss. The property chosen for settlement purposes is located in Adams County, Mississippi, from which, for various reasons, all negroes have left. Four thousand acres have been acquired for the colonization scheme and forty acres will be allotted to each family.

Illinois Central to Establish Twenty-six New Farms.—Twenty-six new experimental farms will be established soon along the lines of the Illinois Central Railroad, President C. H. Markham announces. Fifteen will be located at various points on the Central of Georgia Road, a subsidiary of the Illinois Central, and eleven on the lines of the Illinois Central proper.

These will make a total of 27 farms of this kind on the Illinois Central and thirty on the Central of Georgia. Most of the new farms along the Illinois Central proper will be in Mississippi. Charles M. Brumfield is in charge of the agricultural work of both roads. His headquarters are in Memphis, Tenn.

Assisting the Farmers of Oklahoma.—The railroad companies operating in Oklahoma have been giving a great deal of attention to agricultural educational work. The Missouri, Kansas and Texas, Rock Island, Santa Fe and Frisco, as well as the other lines have with regularity run special trains carrying lecturers through the State in an effort to educate the farmers in proper seed selection and agricultural methods. The preliminary work of this character has obtained very satisfactory results.

LABOR.

Firemen's Wage Controversy to be Arbitrated.—The big development of the month, as recorded more fully in another section of this issue, was the agreement reached between the management of the Eastern railways and the representatives of their firemen to arbitrate their differences under the Erdman Act. The railroads were naturally reluctant to employ this method, as it was believed to be wholly inadequate to handle the situation properly, but as the firemen were on the verge of declaring a strike the railway managers decided, under protest, to accept the only Governmental means available, rather than cause the public the extreme inconvenience which would have been occasioned, had the threatened strike become an actuality.

The demands of railway labor for higher wages, shorter hours and better conditions generally, go merrily on and it is daily becoming more apparent that some adequate method of compulsory arbitration must soon be adopted in spite of the recent heroic statement of Samuel Gompers to the effect that laboring men and women would fight before they would submit to such a form of arbitration.

Several wage increases occurred during the month. By an agreement reached through the assistance of Judge Knapp of the Commerce Court and Acting Commissioner of Labor

Digitized by Google

Hanger, some two thousand telegraphers of the Southern Railway received a wage advance of approximately eight per cent. The additional wage will amount in the aggregate to more than $100,000 a year. A substantial increase in wages has also been granted blacksmiths, machinists, boiler makers and their helpers by the Delaware and Hudson Railroad Company. About four thousand workers will benefit. The Wabash Railroad has increased the wages of two thousand employees in the shops from six per cent to ten per cent. On the New York, New Haven and Hartford a seven per cent increase in pay affecting fifteen thousand mechanics and shop men has been agreed upon.

The strike on the Lehigh Valley at Packerton, Pa., which began February 8th, because the officials of the Company refused to reinstate one hundred and seventy men who were recently laid off, has apparently proved unsuccessful as the latest reports state that the "back bone" of the strike is broken and that many of the strikers are requesting that their positions be given back to them. It is stated that so far as the Company is concerned, the strike is over and that more men have applied for positions than the Company needs.

According to a statement issued at the office of the Chicago and Alton at Chicago, the management will adhere to its policy in forcing the rule of "eight hours a day and six days a week" in its shops at Bloomington, Ill. Officials of the various Unions, members of which are employed at the Bloomington shop, conferred recently with President Worthington relative to the rule.

The representatives of the unions contended that the working time in the shops should be reduced to eight hours a day and five days a week in order that the full force may have an opportunity to obtain employment. Five hundred men recently were laid off on account of slack business. It is expected that the union officials will submit a report to their respective organizations before further action is taken.

President Worthington says:

"The railroad feels that the agreement with the unions now in effect is liberal and contains every provision within reason that the company can afford to grant or that labor should ask for. When labor unions attempt to usurp the functions of management to the extent of dictating how many men shall be employed at any one time they are asking for something that cannot be granted."

Rock Island Advises Employees to Save.—Employees of the Rock Island Railroad are being urged to invest their savings in real estate. According to a statement issued by the management of the company, no man of ordinary income should neglect to invest a portion of his earnings in land.

"The young man who makes a payment on a piece of property and assumes further payments will not throw his money away foolishly," says the statement. "A liability of that kind teaches a man to save, gives him a standing in the community, awakens civic pride in his bosom and makes him a better citizen.

"More than sixty years ago the relatives of John Hunt, of New York, tried to have him declared insane because he paid $2,400 for a bit of New York real estate. The other day the same piece of property sold for $1,825,000. Real estate in the right location is an ideal investment. It cannot be destroyed, burned, lost or stolen, and it will increase in value more rapidly than money in almost any other form.

"The young man who puts his money into lots instead of squandering every cent on that characteristically American delight known as 'having a good time,' which is the real cause of extravagance, is laying a foundation for success."

United States Steel Corporation Increases Wages.—The United States Steel Corporation has announced a wage advance of 14 2-7 per cent for unskilled laborers and approximately 10 per cent for all skilled laborers. The day laborer getting 17½ cents an hour will be paid 20 cents. In the Carnegie mills 38,000 men are affected.

Increase in United States Steel Pensions.—The trustees of the United States Steel and Carnegie Pension Fund, which went in operation February 1, 1911, has made public its second annual report. It shows total disbursements for 1912 of $358,780, as against $281,457 for 1911.

BOOK REVIEWS.

Rates and Regulation.—By William Z. Ripley, Ph.D., Harvard University. Net, $3.00.

For various reasons, railroads during the last ten years have occupied a peculiarly prominent place in public attention in the United States. Representing an investment of about one-fifth of the nation's wealth, their affairs are a matter of direct concern, through bankers, to thousands of holders of their securities all over the country. Every merchant and manufacturer, in connection with the every day conduct of business, is bound, as a shipper, to be interested in their status. Several million officials and employes are dependent upon railroad welfare for their livelihood. The general public, as consumers, is vitally concerned with the manner in which they are conducted; and now, since the advent of strict public control of rates, in the outcome of that political experiment. The legal profession is directly interested also—by way of the multitude of cases now arising for settlement before the various Federal and State Railroad Commissions. This treatise, more detailed and elaborate than a mere text-book, aims to set forth the nature of the railroad problems of the time commercial, fiscal and political; while at the same time avoiding the extreme technicalities of the narrow specialist. The first volume, now ready, deals with the matter of rates and governmental regulation; while the second, in preparation and nearly ready, deals with matters of finance and corporate organization. Amply provided with footnotes and references, the text, nevertheless, deals with the subject in a manner comprehensible to the ordinary reader. Over forty maps and illustrations in the first volume alone serve to render the problems discussed more interesting and intelligible. It is a work which should appeal alike to bankers, investors, railway officers and employes, lawyers and publicists as well as to all students of economics and politics and the serious general reader.

Synopsis of the Sixty-Sixth Annual Report of the Pennsylvania Railroad Company.

THE PENNSYLVANIA RAILROAD COMPANY.

GENERAL OFFICE, BROAD STREET STATION, PHILADELPHIA, February 28th, 1913.

The Board of Directors submit herewith to the Stockholders of The Pennsylvania Railroad Company a synopsis of their Annual Report for the year 1912:-

Rail operations—Revenues		$174,607,598.22
Rail operations—Expenses		126,637,944.59
Net revenue—Rail operations		$47,969,653.63
Auxiliary operations—deficit		1,147,985.23
Net Railway operating revenue		$46,821,668.40
Railway tax accruals		7,128,535.02
Railway operating income		$39,693,133.38
Other income:		
Income from securities	$14,527,491.56	
Hire of equipment, etc.	4,762,241.75	19,289,733.31
Gross income		$58,982,866.69
Deductions from gross income		16,828,902.66
Net income		$42,153,964.03
Disposition of net income:		
Appropriations to sinking and other reserve funds	$1,138,627.92	
Portion of principal of equipment trust obligations	2,901,727.99	
Cash dividends	27,198,918.00	
Appropriations for Additions and Betterments	8,365,479.53	
Construction expenditures on branch roads	888,107.06	$40,492,860.50
Balance transferred to credit of Profit and Loss		$1,661,103.53

CONDENSED GENERAL BALANCE SHEET.

DECEMBER 31st, 1912.

ASSETS.		
Property investment:		
Road	$282,948,637.64	
Equipment	154,130,678.53	
	$437,079,316.17

Synopsis of the Sixty-Sixth Annual Report of the Pennsylvania Railroad Company.—Continued.

The number of tons of freight moved on the five general divisions east of Pittsburgh and Erie in 1912 was 143,480,431, an increase of 18,305,363, or 14.62 per cent.; the number of passengers was 72,452,887, an increase of 5,007,173, or 7.42 per cent.

The Railroad Companies east of Pittsburgh and Erie in which your Company is interested show satisfactory results. Detailed statements of their operations will be found in their respective annual reports, as well as in the full report of your Company.

The number of tons of freight moved on the lines west of Pittsburgh was 165,449,782, an increase of 26,672,392. The number of passengers carried was 34,326,381, a decrease of 335,069.

The operating revenue of all lines east and west of Pittsburgh for the year 1912 was $374,096,179.92; operating expenses, $291,867,378.81, and operating income, $82,228,801.11, an increase in operating revenue, compared with 1911, of $37,612,367.16, and an increase in operating income of $7,039,773.63. There were 473,174,093 tons of freight moved on the entire system, being an increase of 59,955,772 tons, and 178,811,733 passengers carried, an increase of 9,816,577.

There were expended during the past year for construction, equipment, and real estate on the Lines West of Pittsburgh $16,236,642.13.

The expenditures were principally for new ore docks at Cleveland, the elevation of tracks in that city, and also in Chicago and Fort Wayne, the construction of additional main tracks on the Pittsburgh, Fort Wayne and Chicago Railway, the Cleveland and Pittsburgh Railroad and the Pittsburgh, Cincinnati, Chicago and St. Louis Railway, land for new freight station at Indianapolis, increase in yard and station facilities at various points, and for additions to and improvement of the equipment.

GENERAL REMARKS.

The Income Statement is in the form prescribed by the Interstate Commerce Commission, effective July 1st, 1912, which requires the statement of certain parts of the Income Statement in greater detail; as well as showing the receipts and disbursements of certain accounts. The Company is further required to include the Income derived by Sinking and other Reserve Funds as part of its Income; but as it is not permitted to charge as a payment interest on any part of its bonds which may be held in any of the Sinking or Trust Funds, such interest on bonds so held cannot be included in said Income. While these accounting changes result, therefore, in apparently swelling the Net Income of the Company to the extent of $786,230.60 yet it is offset by corresponding necessary appropriations to these funds out of net income, which appropriations were formerly included in fixed charges.

This Statement shows that the total Rail Operating Revenues were $174,607,598.22, the largest in the history of the Company, an increase of $17,120,185.52, or 10.87% as compared with 1911.

The increased express traffic resulted in a greater gross return to the Company. The future effect of the parcel post on express revenue cannot as yet be determined, nor is it known what effect the change in express rates, ordered by the Interstate Commerce Commission, will have upon the revenue received from the Express Company operating over your lines.

In the transportation of United States Mails the revenues show a decrease although the volume of the traffic increased. The rates are fixed by Congress, and there is a Congressional investigation of the subject at the present time. It is hoped that, after due consideration is given to the value of this service and to the special facilities it requires, remunerative rates will be paid.

Rail Operating Expenses are also the largest in the history of the Company, showing an increase of $13,409,551.56, or 11.84%, caused principally by the increased traffic, which necessitated not only greater outlays for transportation expenses, but also for repairs and renewals of roadbed, bridges, and buildings, signals and interlocking and for other items which add to the safety and comfort of the patrons and employes of the road; as well as for repairs and renewals of equipment, and increased charges for Depreciation.

The expenses were further increased by the severe weather in January and February, 1912, and they also reflect increases caused by higher wages; the operation of the Extra Train Crew Law; increased cost of fuel and other materials, and improved standards of track and other construction to meet the requirements of heavier rolling stock.

In the wage questions that arose during the past year with the Enginemen and Firemen on the railroads in the Eastern District of the United States, represented by their respective Brotherhoods, a general strike was averted in the case of the Engineers by the appointment of a special Board of Arbitration, consisting of seven members, one selected by the railroad companies, one by the Brotherhood of Locomotive Engineers, and the other five appointed by the Chief Justice of the Supreme Court of the United States, the Presiding Judge of the Commerce Court and the United States Commissioner of Labor, collectively.

This Arbitration Board was constituted after attempts had failed to settle the difficulty through mediation under the Erdman Act, and because the parties in the controversy, while agreeing to the principle of arbitration, would not accept arbitration under the provisions of that Act.

In the difficulties of the present year with the Firemen, represented by the Brotherhood of Locomotive Firemen, a strike was averted by the railroad companies agreeing to submit to arbitration under the provisions of the Erdman Act, which they did not believe to be satisfactory, but accepted rather than impose on the Country, the railroads and the employes the lamentable consequences of a general strike, involving over fifty railroads, having over 25% of the mileage and nearly 40% of the total Operating Revenues and Operating Expenses of all the railroads in the United States.

Considering the magnitude of the interests in this Country and those Countries with which it has commercial relations that would be affected by the interruption of railroad traffic, and the serious results that would ensue therefrom; the stoppage of food supplies, fuel and other traffic, the inconvenience, losses and suffering to the general public whose interest is paramount, and to the workers in other industries dependent on a reliable transportation service and in no way responsible for railway disputes, and the failure of strikes to produce any permanent advantages to either the employes and their families or to the transportation companies, careful consideration should be given to the recommnedations for the amendment of the Erdman Act, which have been made from so many sources interested in the well-being of the Country.

The experience arising from these larger wage controversies places a serious responsibility upon those whose duty it is to enact proper legislation governing the relations between employer and employe, to consider whether the Erdman Act should not be amended to increase the number of arbitrators and thereby constitute a Board of sufficient size to properly represent the public as well as the parties to the controversy, and to direct the necessary far-reaching investigations and fully share the responsibility of an impartial determination of the equitable and economic questions arising from such disputes. It will also be found necessary to provide a longer time than thirty days specified in the Act for the consideration of the subject and the rendering of a decision.

It may not be possible to prevent strikes or lockouts by requiring compulsory arbitration, but it is wise to consider whether an obligation should not be placed upon the employer and employe to advise the authorities of the questions at issue before any lockouts or strikes can become effective, so that by due publication and inquiry the Government and the public may be fully informed of the extent of the controversy and its causes.

The net revenue of rail operations shows an increase of $3,710,633.96.

Taxes continue to increase, the charges for the present year exceeding those of the previous year by $332,649.28.

The tonnage for the year increased 14.52% and tonnage mileage increased 13.35%, while the freight train mileage increased only 10.95% due to an increased train load of 2.17%.

The passengers carried increased 7.42% with increased passenger mileage of 6.71%, while in the face of this, the passenger train mileage increased only 1.88% due to the average number of passen-

Synopsis of the Sixty-Sixth Annual Report of the Pennsylvania Railroad Company.—Continued.

gers per train increasing 4.84%.

In the deductions for lease of other roads the larger payments are due to the increased revenue earned on Roads operated on the basis of Net revenue.

The decrease in the interest deductions for funded debt, compared with 1911, was due to the maturity and payment on May 1st, 1912, of the River Front Railroad Company First Mortgage Bonds; and on November 1st, 1912, of the Pennsylvania Railroad Company 3½% Convertible Bonds of 1902, and also to the payments of principal due on Equipment Trust Obligations.

The Company has in contemplation many important and extensive necessary improvements, a large portion of which should not be charged to Capital Account, and for which the Reserve for Additions and Betterments will be utilized, such as the improvements of Broad Street Station, Philadelphia, and its approaches and facilities; improvements on the Allegheny Division hereinafter referred to; the elimination of grade crossings and elevation of tracks on the New York Division, from Colonia eastward, through the City of Rahway, to Bay Way, Elizabeth, and a slight change of line in the City of Elizabeth, where the line has already been elevated. It also contemplates the abolition of additional grade crossings in Philadelphia, Lancaster, Lilly, Johnstown Freeport, Wilkinsburg, Pittsburgh, and other points on its lines when the local authorities cooperate in making the eliminations. The Company also has in contemplation the construction of a new double-track steel bridge over the Allegheny River at Kiskiminetas Junction on an improved line to take the place of the present single-track bridge.

The Capital Stock was increased over the previous year by $100.00, of which $50.00 was issued in exchange for Fractional Convertible Bond Receipts, and $50 for Dividend Scrip dated May 31, 1893.

The Funded Debt and Equipment Trust obligations were reduced as follows:—

Redemption through Sinking Funds:	
Consolidated Mortgage 3½% Bonds due July 1, 1945.....	$66,930.00
Equipment Trust Loan due 1914..	121,000.00
Collateral Trust Loan Bonds 4½% due June 1, 1913.....	51,000.00
Philadelphia, Wilmington and Baltimore Railroad 4% Stock Trust Certificates due July 1, 1921.....	114,000.00
Payment at Maturity of:	
Ten Year Gold Convertible 3½% Bonds.....	10,222,500.00
River Front Railroad Company's 1st Mortgage 4½% Bonds.....	212,000.00
Equipment Trust obligations.....	6,441,100.07

It will shortly be necessary for the Company to provide capital for the $10,222,500. of Ten Year Gold Convertible 3½% Bonds which matured November 1st, 1912, and for $9,735,000.00. of Collateral Trust Loan 4½% Bonds due June 1st, 1913, together with maturing equipment trust obligations, and also for new construction work, the extension and improvement of terminals, track and facilities, and the purchase of equipment. The matter is now receiving careful consideration, but no decision has yet been reached as to the form or extent of the proposed financing.

The issues of Equipment Trust Securities during the year consisted of $7,000,000.00 of Pennsylvania General Freight Equipment Trust Certificates of 1912, of which the Pennsylvania Railroad Company's proportion was $1,572,100.00. There were thus furnished for the Pennsylvania Railroad Company 875 steel underframe and steel bodyframe refrigerator cars; for the Pennsylvania Company 1,000 steel underframe and steel bodyframe automobile box cars; for the Pittsburgh, Cincinnati, Chicago and St. Louis Railway Company 3,000 all steel coke gondola cars; and for the New York, Philadelphia and Norfolk Railroad Company 800 steel underframe ventilated box cars and 50 steel underframe gondola cars, an aggregate of 5,725 cars.

During the year the final payments were made under 19 series of equipment trusts, the original issue of which amounted to $19,000,000. These series covered 3,325 steel underframe box cars, 3,000 steel hopper gondola cars, 6,000 steel underframe long gondola cars, in service on the Pennsylvania Railroad; 500 refrigerator cars, 1,500 steel hopper gondola cars, 600 steel underframe long gondola cars, 500 steel flat cars, sub-leased to the Pennsylvania Company; 210 steel underframe box cars, 300 steel hopper gondola cars, 400 steel underframe long gondola cars, subleased to the Pittsburgh, Cincinnati, Chicago and St. Louis Railway Company; 200 steel hopper gondola cars, sub-leased to the Cleveland, Akron and Cincinnati Railway Company; and 85 refrigerator cars sub-leased to the Grand Rapids and Indiana Railway Company, representing in all 16,620 cars.

The cars therefore have become the property of the respective companies which paid the cost thereof.

The expenditures for acquisition of property during the year were mainly to cover additional right of way for new lines, elimination of grade crossings, and for passenger terminal and station improvements at Broad Street Station, and other points in Philadelphia, and for the enlargement and improvement of freight stations and yard facilities, at Hamburg Junction and Greenwich in Philadelphia, Elizabethtown, Altoona, Cresson, Uniontown, Tarentum, Peterson and New Kensington.

The block signal system on the main line between New York and Pittsburgh was further improved by the installation of automatic signals on the Philadelphia Division between Dillerville Block Station and Branch Intersection, and on the Pittsburgh Division between Summerhill and Latrobe, and the work will be continued next year on the Middle and Philadelphia Divisions.

The Cortlandt Street Ferry House and Dock, New York City, which are being rebuilt, have so far progressed that the two ferry slips are now in operation, and the remainder of the work will be completed in 1913.

On the Newark Rapid Transit Line, described in the Annual Report for 1910, the Summit Avenue passenger station, Jersey City, was partially completed and opened on May 30th, 1912, and has since been finished and is accommodating a large amount of traffic. The Fourth Street Station in Harrison, N. J., on this line, will be completed early in 1913.

For the eastern section of the six-track system on the New York Division between Colonia, N. J., and Waverly, west of Newark, N. J., additional right of way has been acquired. This work comprehends station improvements, the elimination of fifteen grade crossings by the elevation of the four existing main tracks, and also the construction of two additional elevated tracks between those points. Construction work is now proceeding between Colonia and Elizabeth, and should be completed in 1914.

The State of New Jersey, in which your Company and other lines have extensive mileage, is now considering the enactment of new legislation for the elimination of grade crossings. It has long been the policy of the Company to encourage the removal of grade crossings, and it has spent large sums of money for that purpose, but still greater results in this direction would have been attained had the States and municipalities been authorized, or willing, to co-operate in the outlay. The railroads in many instances have been the pioneers in the development of the towns, cities and territories served by them, and their existence has materially added to the population and prosperity of these communities. But with so many crossings still to be eliminated, the greatly increased payments for taxes and other items, and outlays for improvements in their railroads and equipment, which still confront them and are essential to public safety and convenience, it seems unfair and unwise to propose that the railroad companies should be burdened with either the entire cost, or an undue proportion of the cost, of eliminating grade crossings, many of which have been opened subsequently to the construction of the railroads, and against their strong protest. For these reasons and on account of the great increase of motor, street railway, vehicular and pedestrian travel, it is hoped that the legislation now pending will be so framed in the public interest, as to enable either the State, the municipalities or the railroads to take the initiative in the abolition of existing crossings, and to co-operate in carrying on the work by providing a fair and equitable division of the expenditure, as do the laws of New York, Massachusetts, Vermont, Ohio and other States.

The improvement of the passenger facilities in Philadelphia is still receiving consideration by the various departments in the service, and also by the Consulting Electrical Engineers of the Company. As outlined in the last annual report, it will necessitate (1) an increase in the tracks and

Digitized by Google

Synopsis of the Sixty-Sixth Annual Report of the Pennsylvania Railroad Company.—Continued.

platforms, and the enlargement and improvement of the station facilities at Broad Street Station and its approaches as far as West Philadelphia Station and Yard; (2) the widening of the bridge, and its approaches, over the Schuylkill River and the adjoining entrances to Fairmount Park at Girard Avenue, by the construction of two additional tracks and a revision of the signals and interlocking, which is now proceeding, and (3) the enlargement of North Philadelphia passenger station and its approaches by the addition of four new tracks with high level island platforms, and other improvements including the relocation of the junction of the Chestnut Hill Branch with the New York Division at that point, which is now under contract.

In brief the Philadelphia Terminal problem is to provide increased terminal facilities and approaches for approximately 20 years, for lines which equal eight double-track railroads.

An Ordinance was obtained from the City of Philadelphia to erect a new eight-track concrete steel bridge across North Broad Street near North Philadelphia Station.

Pending the results of the investigation of terminal improvements for Broad Street Station, Philadelphia, satisfactory progress is being made in the acquisition of the necessary real estate.

Extensive repairs and additions are being made to the West Philadelphia stock yards of the Company, and the piers at Greenwich, Philadelphia, are being improved, and the dock extended, to facilitate the loading of coal at that point.

On the Bald Eagle Valley Branch the grades are being revised and the line is being double-tracked between Mount Eagle and the Howard Rolling Mills and passing sidings are being extended, to provide for the increased tonnage passing between the Main Line and the Erie Division via Tyrone and Lock Haven.

On the Pittsburgh Division four grade crossings are being abolished in Braddock, Pa., by the construction of three under-grade bridges and one over-head bridge; work is in progress on the elimination of grade crossings in the City of Pittsburgh at Homewood Avenue, and the work of eliminating all grade crossings in the Borough of Wilkinsburg has commenced.

In West Brownsville Yard, Pa., the change of grade and extension of track facilities, necessary to connect with the new double track Monongahela River bridge, at that point are almost completed.

On the Sunbury Division the double tracking was further extended during the year by constructing second tracks at Boyd and South Danville, and between Port and Honey Pot Yard, Pa.

At Montgomery, Pa., the sixteen span double track steel bridge over the West Branch of the Susquehanna River, replacing the single track bridge at that point, will be completed this year.

The aggregate expenditures for Construction and Equipment during the year upon the owned and leased lines of this Company was $16,322,247.38 for which the Company has been reimbursed by leased lines to the extent of $727,502.41. The sum of $888,107.06 was expended on the Western New York and Pennsylvania Railway, Cambria and Clearfield Railway, and other Branch Roads, and charged against Income as Expenditures on Branch Roads for Construction. The expenditures on the line owned and on the Harrisburg, Portsmouth, Mt. Joy and Lancaster Railroad and the United New Jersey Railroad and Canal Company, operated under long-term leases, comprising the main line system between New York and Pittsburgh, amounted to $14,706,637.91, which has been disposed of as follows:—

Charged to Income as Extraordinary Expenditures.....	$1,841,127.72	
Charged to Reserve for Additions and Betterments appropriated out of Income of previous year.....	3,652,567.37	
		$5,493,695.09
Charged to Capital Account:		
Road.....	$3,602,489.93	
Equipment.....	5,610,452.89	
		9,212,942.82
		$14,706,637.91

Under the Balance Sheet prescribed by the Interstate Commerce Commission, the Road and Equipment Account includes not only these capital charges, but also similar expenditures made out of Income since June 30th, 1907. Therefore, the expenditures charged against Income and against the Reserve for Additions and Betterments, created in previous year have been so included.

The Additions and Betterments expenditures on the Harrisburg, Portsmouth, Mt. Joy and Lancaster Railroad and the lines of the United New Jersey Railroad and Canal Company, both operated by this Company under leases for 999 years have also been included under the Road and Equipment Account as "Leased Lines—Road."

Expenditures durjng 1912.....	$1,979,160.61
Expenditures June 30th, 1907, to December 31st, 1911.....	9,940,950.10
	$11,920,110.71

An offsetting liability appears on the credit side of the Balance Sheet, entitled "Additions to Property since June 30th, 1907, through Income," in which is carried not only the $5,493,695.09, but also the payments through Income on account of Car Trust Certificates amounting to $2,901,727.99 for 1912, and $637,644.08 for previous years, aggregating $9,033,067.16.

On account of principal and interest of Water Supply Trust Certificates $524,351.81 were expended during the year and charged against Income.

The construction of the New York Connecting Railroad, owned jointly by this Company and the New York, New Haven and Hartford Railroad Company, as described in the report of last year, is proceeding. Additional contracts have been awarded for foundations and masonry of Bronx Viaduct; foundations and masonry of Piers for Bronx Kills Bridge, Randalls Island Viaduct, Little Hell Gate Bridge, and Wards Island Viaduct; for the bases and foundations of the East River Bridge on Wards Island and Long Island City; and for the Long Island Viaduct; for foundation and masonry between Lawrence and Stemler Streets; and for grading and masonry between its connection with the Pennsylvania Tunnel and Terminal and the Long Island Railroads at Woodside Avenue and Fourteenth Avenue.

The increasing traffic between Pittsburgh and Buffalo via the Allegheny Division and the Western New York and Pennsylvania Railway requires the construction of three tunnels and the reduction of grades and other improvements on the Allegheny Division between Pittsburgh and Oil City, and the reduction of grades and improvements of the railroad and yard facilities on the said railway between Oil City and Buffalo, via Brocton and the Chautauqau Branch, to more fully utilize it as the principal route for passenger and freight traffic between these cities, and the work has been authorized. As the result of these improvements, the heavy grades will be restricted to relatively short distances between the said cities, and this route, which was objectionable because of heavy grades, will be over 58 miles shorter than the present route via Oil City, the Salamanca Branch, and Olean, and will have not only this advantage in distance, which will produce satisfactory operating economies, but its use will postpone for several years the double tracking and other expenditures on the present route.

To meet the Construction and Equipment expenditures on the Western New York and Pennsylvania Railway during the year, advances aggregating $525,212.30 were made by this Company, and charged against the net income of the Lessee Company. This Company will also be required to provide funds for the improvements heretofore mentioned on that railway during the year 1913.

On the Cambria and Clearfield Railway, the Cherry Tree and Dixonville Railroad, and the Pennsylvania, Monongahela and Southern Railroad, various short branches were built to reach coal mining operations.

This Company advanced $184,591.36 to the Cambria and Clearfield Railway Company to meet its construction expenditures, which was charged against the net income of the Lessee Company.

It has been deemed advisable to absorb the Cambria and Clearfield Railway Company, which for many years has been owned and operated by this Company in connection with its main line, the construction of that road and its several constituents having been promoted by this Company for the development of the bituminous coal traffic in the Clearfield region. The necessity for maintaining that Company as a separate corporation no longer exists, and the agreement providing for its acquisition will, in accordance with notice given

Digitized by Google

Synopsis of the Sixty-Sixth Annual Report of the Pennsylvania Railroad Company.—Continued.

to the stockholders, be submitted for approval at the annual meeting.

The sum of $94,408.94 was advanced to the Pennsylvania, Monongahela and Southern Railroad Company to meet its construction expenditures for 1912, for which it reimbursed this Company by the issuance of its stock and bonds in equal portions.

A fireproof grain elevator of enlarged capacity and modern facilities is being erected by the Girard Point Storage Company at Girard Point, Philadelphia, to take the place of the present elevator.

On the Philadelphia, Baltimore and Washington Railroad, the work of reconstructing the bridges over the Gunpowder and Bush Rivers is proceeding, and will be finished during 1913. The reconstruction of the bridges over Stemmers Run, Back River and Gwynn's Falls will also be undertaken in the present year.

The installation of automatic block signals on the Maryland Division has been completed between Washington and Baltimore, between Principio and Iron Hill, and between Ruthby and Wilmington, and the work will be continued next year.

On the Northern Central Railway the work of enlarging the Mount Vernon Yards, Baltimore, was entirely completed. The freight facilities at York, Pa., Highlandtown, Md., and at Marysville Yard, are also being enlarged and improved to accommodate the increased traffic. These improvements will probably be completed in 1913.

The execution and delivery of the proposed lease by this Company of the railroad, property and franchises of the Northern Central Railway Company, is still delayed by litigation. Under its provisions, which have been fully explained in the Annual Report for 1910, the lease and rental payments became effective January 1st, 1911, and an accounting between the lessor and lessee from that date will be necessary if and when the lease has been duly executed and delivered in conformity with its terms,and conditions.

The Wilkes-Barre Connecting Railroad Company was incorporated during the year jointly by this Company and the Delaware and Hudson Company to provide a line, seven miles in length, from Buttonwood Yard on the Pennsylvania Railroad, west of the City of Wilkes-Barre, to Hudson on the line of the Delaware and Hudson Company, to facilitate the interchange of traffic between the two roads, and avoid its movement through the business centre of that city, and via the tracks of other railroads.

The surplus property fronting on Seventh Avenue between Thirty-second and Thirty-third Streets, New York City, owned by the Pennsylvania Tunnel and Terminal Railroad Company, a subsidiary of this Company, has been conveyed to the Pennsylvania Terminal Real Estate Company looking to its future development.

During the year the Company made advances to the Long Island Railroad Company aggregating $2,625,000, for the improvement of its railroad and facilities, and the construction of new lines and equipment, and will receive therefor securities of that Company.

Minor advances were also made to the Pennsylvania Tunnel and Terminal Railroad Company in 1912, for which its certificate of indebtedness to this Company has been issued.

The pensions paid during the year amounted to $646,375.34.

The stockholders will be asked to authorize an increase in the annual sum set apart for pension purposes from $700,000, to $750,000 per annum and to give authority to the Board of Directors to hereafter increase the pension appropriation to such extent as may, from time to time, be necessary to meet the purposes for which the Pension Department was created; such increase to be reported to the stockholders.

The additional appropriation is necessitated by the increasing number of pensioned employes, especially between the ages of 65 and 69 years; and the advances in wages made from time to time, which increase the average pension allowances.

The securities held by the Company, December 31st, 1912, at a valuation of $331,909,154.32, produced a direct income during the year of $14,527,491.56. During the year the Company increased its holdings of Norfolk and Western Railway Company Common stock, by $4,788,100.00 through the conversion of a like amount of Norfolk and Western Railway Company Convertible bonds, to which it had subscribed at par, during the year, and also acquired $3,000,000 of Pennsylvania Terminal Real Estate Company stock.

Effective May 8th, 1912, the name of the Buffalo and Allegheny Valley Division was changed to Northern Division.

By order of the Board,

SAMUEL REA,
President.

Improvements of the Boston & Maine at Mechanicville, N. Y.—The opening to operation this week of four of the new "hump" tracks at Boston & Maine Railroad's great inbound gateway at Mechanicville, N. Y., is an event which, it is believed, certainly foreshadows some very notable improvements in Boston & Maine's eastbound freight movement.

The hump-yard system has never before been employed by any of the New England roads and expenditures connected therewith rising $2,000,000, that have now been entered upon by the Mellen lines, bid fair to be reflected in a short time in the most substantial betterment of New England's eastbound freight schedules, which in the past have been a principal subject of service complaints. At Mechanicville fully 40 per cent. of the freight brought into New England over Boston & Maine lines will be classified.

Railway World

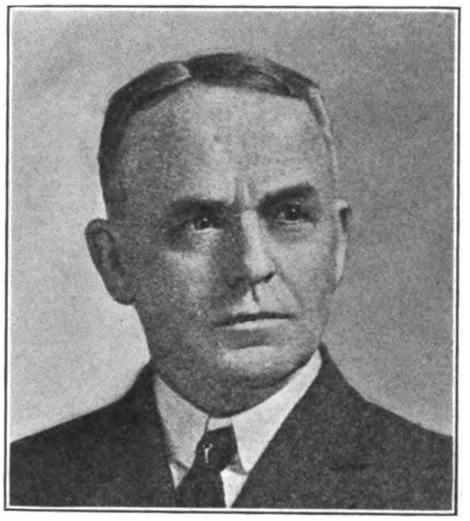
VOL. LVII. APRIL, 1913 No. 4

Important Developments in the Transportation Field

CURRENT DISCUSSIONS OF RAILWAY PROBLEMS

The railway presidents continue their policy of presenting their views upon current economic questions regarding which they are preeminently fitted to express intelligent opinion. Mr. William C. Brown, president of the New York Central lines, directs the attention of the country to the primary needs for improvement in agriculture. Speaking at the Interstate Agricultural and Industrial Conference at St. Joseph, Mo., on March 8th, he called attention to the low yield of American agriculture as compared with the results achieved abroad. The farms of the United States, he pointed out, produce an annual yield of only 14½ bushels of wheat per acre as compared with 31 bushels in Germany; only 30½ bushels per acre of oats as compared with 51 for Germany. Twenty-five years ago the yield of these crops in Germany was about the same per acre as the United States farmer is now procuring. The difference represents the results of science applied to agriculture. President Brown urged upon his audience the paramount importance of agricultural improvement. The results which have been achieved abroad can be duplicated in the United States. The conservation of timber land, of mineral resources and of water power are important. It is essential to the public welfare that these resources be widely utilized. But these forms of conservation are of little importance compared with the improvement of agriculture. The address closed with the following striking declaration:

"In every age and in every nation agriculture has been the foundation upon which national prosperity has been established and upon which its continuance has depended. In this great country of ours, with its vast resources of fertile, productive acres, buttressed as it has been in the past by other almost unlimited reaches of unoccupied, uncultivated land, equally fertile, the importance of agriculture has been very inadequately appreciated. Gradually the fact that farming—the cultivation of the soil—is the most important business in the world, is being recognized; and the earnest attention of not only this country but of every nation of the earth, is being anxiously directed to every effort looking to its improvement.



WILLIAM C. BROWN,
President, New York Central Lines.

"More to-day than at any time in our history the issue of national prosperity or adversity lies in the hands of the American farmer. Nothing should be left undone that will strengthen or encourage him in the great work in which he is engaged."

Mr. B. F. Yoakum, chairman of the Executive Committee of the St. Louis and San Francisco, is the most prominent exponent of the improvement of primary methods of transportation, and of the methods of distribution between producer and consumer. He seldom fails in his numerous public utterances, to bring one or the other of these phases of national economy prominently forward. In a recent statement, issued on his return from Texas, he discussed the problem of wagon transportation in that state as follows:

"In 1912, 60,000,000 tons of farm and other business were hauled over the public wagon roads of Texas. The average haul was twelve miles and the average cost twenty-one cents. For each ton moved one mile the same tonnage hauled by a railroad costs about one cent per mile. The difference is twenty cents per ton for each mile hauled. This carried out logically shows that each mile of wagon haul replaced by railroad transportation saves $12,000,000 annually to the people of the state.

"The average haul over wagon roads of Iowa is

Digitized by Google

six miles. If Texas were supplied as well with railroads as Iowa on an area basis and the average haul over the wagon roads of Texas was reduced from twelve to six miles, the annual saving to the people of the state would be $72,000,000."

SAMUEL REA,
President, Pennsylvania Railroad Company.

An amendment of the Erdman act, which shall furnish a permanent agency for adjusting the constantly recurring disputes between the railways and their employes, is urged by President Rea, of the Pennsylvania Railroad, in the annual report of the company. He specifically stated that the reasons for submitting the dispute between the firemen and the Trunk Line railroads to arbitration under the Erdman act was the reluctance to impose upon the country the hardships of a general strike.

"Considering the magnitude of the interests in this country and those countries with which it has commercial relations that would be affected by the interruption of railroad traffic and the serious results that would ensue therefrom; the stoppage of food supplies, fuel and other traffic, the inconvenience, losses and suffering to the general public whose interest is paramount, and to the workers in other industries dependent on a reliable transportation service and in no way responsible for railway disputes and the failures of strikes to produce any permanent advantages to either the employes and their families or to the transportation companies, careful consideration should be given to the recommendation for the amendment of the Erdman act, which have been made from so many sources interested in the well being of the country.

"The experience arising from these larger wage controversies places a serious responsibility upon those whose duty it is to enact proper legislation governing the relations between employer and employe, to consider whether the Erdman act should not be amended to increase the number of arbitrators and thereby constitute a board of sufficient size to properly represent the public as well as the parties of the controversy and to direct the necessary far-reaching investigations and fully share the responsibility of an impartial determination of the equitable and economic questions arising from such disputes. It will also be found necessary to provide a longer time than the thirty days specified in the act for the consideration of the subject and the rendering of a decision.

"It may not be possible to prevent strikes or lockouts by compelling arbitration, but it is wise to consider whether an obligation should not be placed upon the employer and employe to advise the authorities of the question at issue before lockouts or strikes can become effective, so that by due publication and inquiry the Government and the public may be fully informed of the extent of the controversy and its causes."

President Truesdale, of the Delaware, Lackawanna and Western, in his annual report, calls attention to a circumstance which should engage the minds of all thoughtful men at this time when the question of railway wages is so prominent. On the morning of July 4, 1912, an accident occurred on the lines of this company near Corning, N. Y., resulting in the death of 39 passengers, and the injury of 75 more. This accident as revealed by the investigations of the Interstate Commerce Commission and of the Public Service Commission of New York,

W. H. TRUESDALE,
President, Delaware, Lackawanna & Western Railroad.

Digitized by Google

was charged entirely to the engineer, who ran by three standard block signals, one set at "Caution" and two at "Danger" and also one in the hands of a flagman. Prior to taking this run the engineer had been off duty thirty hours and the evidence showed that he had employed a large part of the time in saloons. Owing to various influences brought to bear in his behalf, although this engineer was indicted by the grand jury upon the finding of the coroner's jury, the judge who was to have tried the case dismissed the indictment, and the engineer was allowed to go free without trial. He remains a member in good standing of the Brotherhood of Locomotive Engineeers. About the same time a special agent of the company engaged in driving off trespassers accidentally killed one of them. He was immediately arrested, tried and sentenced to a fine and six months' imprisonment. President Truesdale upon this set of facts, makes the following impressive comment:

"The mere statement of the facts in these two cases furnishes an impressive illustration of the unusual and unaccountable state of the public mind as respects its attitude toward the railway companies, as also the relations that exist between the latter and their employes. Under the provisions of the multitude of laws, Federal and State, which exist and others that are constantly being enacted the duties and responsibilities of the railways, both to the public and to their employes, are made more onerous and burdensome, while, on the other hand, no similar requirements are imposed on the individual employe either to fit himself or to keep himself in physical condition to perform the duty which is expected and required of him in order to enable his employer, the railway company, to meet its obligations.

"This situation, with resulting failure to realize responsibility, coupled with the insidious and far reaching influences continually at work to undermine loyalty, destroy discipline and lower efficiency in the rank and file of railway employes, without question constitutes to-day the most serious and perplexing problem with which the railway managers of the country have to contend."

SLIGHT INCREASE IN RAILWAY MAIL PAY

The Committee on Railway Mail Pay, acting on behalf of the 268 railway companies throughout the United States, won a slight concession from the last Congress, in the matter of increased pay to the carriers for carrying the extra mail burden imposed by the parcel post service. The Postmaster General is authorized to add five per cent to the compensation paid for transportation on railroad routes on July 1st, 1913.

According to President Ralph Peters, of the Long Island Railroad Company, vice-

ALBERT BURLESON,
The New Postmaster General.

chairman of the committee, this amendment is only a short step in the direction of securing adequate pay for carrying the mail. It can add, at the outside, only about $2,000,000 additional compensation to the amount whch the railroads are now receiving, and only partially makes up the loss which the railroads are sustaining from the larger burdens which the parcel post places upon them. We cannot doubt that the entire subject will be speedily reopened. The glaring injustice of changing the terms of a contract to the prejudice of one party to the contract, and against his consent, a method of procedure which would not be possible with any contract to which the Government was not a party, is, it is believed, now sufficiently apparent to influence Congress to grant the demand for a general reweighing of the mails this fall, and for the granting of compensation commensurate with the service rendered.

THE VALUE OF A PHYSICAL VALUATION

The physical valuation bill is now a law; the work, will, it is estimated, cost about $12,000,000 to be equally divided between the railroads and the Government.

The bill requires a report by the Interstate Commerce Commission of all kinds of value, tangible and intangible, of the property of the railroads which is used in their business as common carriers. The bill orders a report in detail on each piece of prop-

PROFESSORS COMMONS AND BEMIS ASSISTED SENATOR LAFOLLETTE IN THE PREPARATION OF THE PHYSICAL VALUATION BILL.

erty, the original cost to date, the cost of reproduction now, the cost of reproduction less depreciation, and an analysis of the methods by which these several costs are obtained. The commissioner is required to return a report separately on other values and elements of values of the property of common carriers, not necessaarily used in its business as a common carrier.

A return is also required on "the original cost of all lands, right of way, and terminals owned or used for purposes of a common carrier and ascertained as of time of dedication to public use and the present value of the same and separately the original and present cost of condemnation and damages or of purchase in excess of such original cost or present value."

A report by the Commission is also directed upon the "history and organization of the present and of any previous corporations operating such property; upon any increases or decreases of stocks, bonds or other securities in any reorganization upon moneys received by any such corporations by reason of any issues of stocks, bonds or other securities; upon the syndicating, banking and other financial arrangements under which said issues were made and the expenses thereof; and upon the net and gross earnings of such corporations; and shall also ascertain and report in such detail as may be determined by the Commission upon the expenditures of all moneys and the purposes for which the same were expended."

The work which will be done by the railroads will be largely voluntary, due to their desire that the valuations reached by the employes of the Interstate Commerce Commission shall be checked and compared with valuation and appraisals by engineers in whom the railroads have confidence.

The RAILWAY WORLD has always contended that the physical valuation of the railroads, so far from injuring them, will result in marked increases in their rates. It is well known that the railroads of the United States could not be duplicated for the present face value of their stocks and bonds. The framers of the valuation bill had this in mind, since they order the Commission to make extensive investigations into the history of railroad costs with the evident intention of offsetting the enormous present values which the investigation will disclose, and of answering the demand for higher freight rates with the argument that the railroads are not entitled to a return on increased values which have resulted from the rapid development of the United States. This answer will not, however, avail. If the valuation of American railroads discloses the fact that their present revenues do not represent what the courts will term a reasonable return on that value, a successful demand can be made on the part of the railroads for higher rates. That such will be the result, most well informed students of railway conditions are agreed.

Some interesting questions are, however,

Digitized by Google

suggested by this view of the outcome of the effect of the investigation. American railroads are not uniformly capitalized. The capitalization of certain companies is far in excess of the value of their physical property. On the other hand, companies operating in the Trunk Line territory are greatly under capitalized. In the case of particular railroads the results of the valuation may be used to advance rates, and the same will be true if the Commission can be persuaded to consider the railway situation as a whole. It is not to be expected, however, that uniform results upon this point are to be achieved. The problem of valuation in itself is extremely difficult of solution and the greatest divergence of opinion upon many points exists among experts. The direction of a resolution to delve into the history of railroad costs complicates the problem tenfold.

JAMES MCREYNOLDS,
The New U. S. Attorney General.

FINDING A SOLUTION FOR A DISSOLUTION

Owing to the opposition of the California Railroad Commission to certain features of the proposed plan for separating the Union and Southern Pacific, the plan has been abandoned. The chief ground on which the Commission refused its consent, was the exclusive lease of the Southern Pacific connecting link between Oakland and Sacramento, known as the Venetia Short Line. The Commission insisted that if the Southern Pacific granted the Central Pacific the right to use this cut-off, it should accord to all competing carriers a like privilege on the same terms.

The special committee of Union Pacific directors, which had the dissolution plan in charge, had anticipated this objection and had made a modification of the plan by which, instead of the previous agreement for trackage rights and joint terminals between the two companies, concerning which conditions had been imposed by the California Commission, provisions were inserted for the interchange of traffic, limited to the interstate traffic, over which the California Commission had no jurisdiction.

There remained, however, for the approval of the Commission, a disposition of the lines north of Tehana, and the lease of the Central Pacific to the Union Pacific. The Commission refused to give its approval to these dispositions, pending its examination of the plan for interchanging traffic. The time limit fixed by the underwriting syndicate which had guaranteed the sale of the $126,650,000 Southern Pacific stock having expired, the plan was withdrawn and the committee must begin all over again. Any new plan will probably be deferred until the Circuit Court has designated in its decision those matters which must be left to the jurisdiction of the California Commission, among these is the question of the joint use of the Venetia cut-off, and the question as to whether the Central Pacific, after its sale, shall be permitted to use all terminals and spur tracks of the Southern Pacific within the state. So far as the question of lease or sale of the Central Pacific is concerned, the California Commission has signified its willingness to waive objections to the sale of the Central Pacific to the Union Pacific if the Attorney General or the court thinks best. The Commission's approval, it has also intimated, would be given to a lease of the Central Pacific to the Union Pacific.

ARBITRATING THE FIREMEN'S WAGE CONTROVERSY

A most significant statement was made at the meeting of the Fireman's Arbitration Board by the chairman, Judge William L. Chambers, on March 15th. In reply to comment by the railroad's representative, bearing on the question of the ability of the railroads to pay the advances demanded by the firemen,

Digitized by Google

ALBERT PHILLIPS,

Vice-President of the Brotherhood of Locomotive Firemen and Enginemen, who represents the firemen on the Committee arbitrating under the Erdman Act.

he said that he did not think it worth while for the contestants to devote too much attention to the railroads' ability to pay. The real question, in his opinion, was whether the firemen and other employes, had to work harder than formerly and whether their efficiency was greater than it has been. If such were the case, the argument for advanced wages might be made out. The problem to be solved by the Board is essentially one of wages. The firemen asked for increases based upon the sizes of the locomotives fired, which would give them a wage of from $2.40 to $4 a day of ten hours or less. On the heavier locomotives two firemen are demanded.

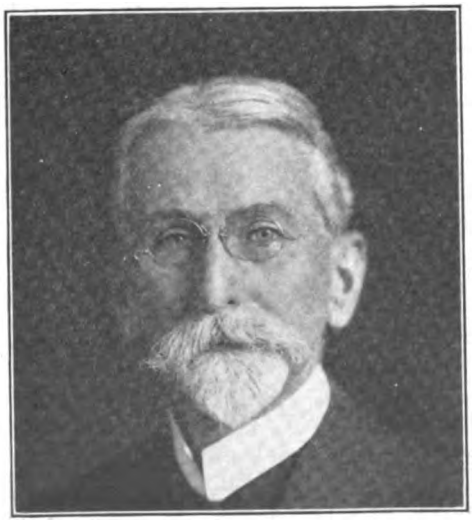
A large amount of testimony has been taken along the lines indicated by the chairman, but an effort has also been made to prove that the railroads can afford to pay the advance. The usual statistical "demonstration" has been made on behalf of the firemen by Prof. W. Gett Lauck, a statistician, who claims that the compensation of the firemen has increased much less rapidly than the corporate income of the company. The substance of the remaining testimony presented on behalf of the firemen was that the work demanded of them was far more severe than formerly, and that the advancing cost of living had absorbed the moderate increase in wages which they have received.

At the opening of the railroads' case, Mr. Elisha Lee, chairman of the Conference Committee of Railroad Managers, took a decided stand in opposition to the contentions of the firemen. He pointed out the unfairness of the position in which the railroads are placed. They are responsible for the performance of a public service; if they do not perform it they may lose their privileges. He continued:

"This board represents the public in a peculiar sense. It embodies, primarily, the widespread and justifiable view, that strikes on public utilities should never be permitted to take place. It gives visible evidence that public convenience is paramount, and to that end all interests must bow.

ELISHA LEE,

Assistant to General Manager, Pennsylvania Railroad, who presented the opening argument for the railways.



WILLIAM L. CHAMBERS,

Who, as independent Member of the Arbitration Committee, holds the balance of power and will virtually decide the Controversy.

Digitized by Google

"To such sentiment the railway companies feel a keen sense of responsibility. To our firemen friends, however, this sense of responsibility does not seem so acute. They represent no one but themselves; they cannot experience the direct results of public displeasure. Railway employes have come to know that a strike which would tie up traffic is well nigh unthinkable. The men make large demands upon railway managers, not expecting those demands to be granted, but believing that arbitration must take place, and the splitting of difference between what they demand and what the railways offer will result in their favor."

Mr. Lee then went on to explain to the Board that the demands of the firemen were part of a well concerted program of exaction practiced upon the railroad by the various unions, the basis of which was the differential in favor of railway employes in the West and South. If a large part of the present demands are granted, the Western firemen will begin an agitation to re-establish the differentials.

The outcome of the dispute is hard to foresee. The suggestion made in many quarters that the railroads should be allowed to increase their rates in order to pay the higher wages demanded would offer solution only in case it were coupled with some agreement with the leaders of organized railway labor as to the percentage of total railway earnings to which they would limit their future railway demands. In the absence of such a standard any considerable advance in rates would be but the signal of a new campaign for higher wages in which the same sinister argument—the threat of a strike, would be employed. In our opinion, an early solution of the difficulty is not likely. After the physical valuation of railroad property has been completed, and the fact has been clearly established, that the returns on railway capital are not unreasonable, it may be possible to reach some agreement, either with or without the force of law, which will establish to the investor as a primary right, a certain amount of railway profit, thereby furnishing a basis upon which the wages of railway labor may be determined.

THE NEW ADMINISTRATION

The advent of a new Administration is always of great interest to business men and investors. Each year sees the scope of government control of trade and industry widen, and deepens the concern with which business men, when they have adapted themselves to one set of laws and administrative policies, regard the new Administration which may force them to radically reorganize their business methods. The general tone of hesitation in finance and business, which has been observable during the last three months, is not due to any defect in fundamental conditions but solely to the apprehension of what the new Administration will mean. During the campaign, which closed with the election of Woodrow Wilson, much was said, both by Democratic orators and by their opponents, which might cause serious foreboding. The Democratic candidate openly avowed himself as the representative of the progressive wing of his party. He was supported by men who stood for radical revision of the tariff and financial systems, stricter control of railroads, drastic enforcement of all legislative statutes, and in general, for the policy which must be regarded as frankly hostile to vested interests. Especially did the tariff policy of the Democratic party cause uneasiness and alarm. American industries are so bound up with the existing system of protection that to threaten a drastic and general reduction of duties was equivalent to a threat of financial disaster. It is no wonder, then, that the business world has been anxiously scrutinizing the situation and the policies of the new Administration as these have developed.

The examination begins with the inaugural address. In so far as the President's utterances can be translated into definite statements, he declares himself in favor of the following policies:

First, certain measures of economic and business reform, including revision of the tariff and currency systems, and further amendment of corporation laws to admit of more perfect protection of the public against the exactions of monopoly.

Second, he declared himself in favor of conservation of our natural resources, putting foremost, under this head, the improvement of agriculture by bringing science to the aid of the farmer, and also indicating, as desirable subjects of Congressional action, the development of water courses, and the extension of Government forest reserves. President Wilson, also, gave much prominence to that reform which is usually described as "social betterment." The following passage is worthy of reading and preservation:

"We have been proud of our industrial achievements, but we have not hitherto stopped thoughtfully enough to count the human cost, the cost of lives snuffed out, of energies overtaxed and

WOODROW WILSON,
President of the United States.

WILLIAM B. WILSON,
Secretary of Labor.

broken, the fearful physical and spiritual cost to the men and women and children upon whom the dead weight and burden of it all has fallen pitilessly the years through. The groans and agony of it all had not yet reached our ears, the solemn, moving undertone of our life, coming up out of the mines and factories and out of every home where the struggle had its intimate and familiar seat."

And in another place:

"There can be no equality or opportunity, the first essential of justice in the body politic, if men and women and children be not shielded in their lives, their very vitality, from the consequences of great industrial and social processes which they cannot alter, control, or singly cope with. Society must see to it that it does not itself crush or weaken or damage its own constituent parts.

"The first duty of law is to keep sound the society it serves. Sanitary laws, pure food laws, and laws determining conditions of labor which individuals are powerless to determine for themselves are intimate parts of the very business of justice and legal efficiency."

Finally, the President pledged himself to do what he could to purify politics and to "cleanse, reconsider, restore and correct."

The address closed with a promise to do nothing which would impair property rights, and to have due regard for the limitations of existing institutions in formulating any scheme for their amendment.

We must, of course, accept without question, that President Wilson means exactly what he says; that he is firmly resolved so far as in him lies, to carry through the program which in briefest outline he set forth in his inaugural address. This program is indeed a drastic one. It is impossible to reconstruct the economic order of society in the thorough-going manner which the President demands, without inflicting vast damage upon property rights, because property rights have grown up in the scheme of things as they are, and any radical change in this scheme must necessarily destroy a large amount of the values which have been based upon it. If, indeed, the country is face to face with four years of reform, if the tariff is to be reduced to a revenue basis, if the banking and currency system is to be radically changed with a view to its decentralization, if laws for the regulation of corporations are to be strengthened and their administration stiffened, if, in a word, the Government control is to be broadened, and if Government is to be more active within the lines already laid down for its activities, then the caution, distrust and hesitation, which are everywhere manifest among business men, are well justified.

Furthermore, if in addition to these long standing propositions for economic reform we are to have a period of social readjustment by which minimum wages are to be established and the burdens upon employers of labor are to be increased, there is the more reason for business to move cautiously.

In expressing an opinion as to the course of action of the new Administration, we have to consider first, the composition of the Administration itself, and second, the composition of Congress, for without the co-operation of the House and Senate, no matter how cordial may be the disposition of the President to enact these various recommendations into law, he can do nothing. The President has selected a strong cabinet, so

Digitized by Google

much is conceded. Although some of the new secretaries are comparatively unknown, there is no one of them who is insignificant. The head of the cabinet, Mr. Bryan, next to former President Roosevelt, commands the largest personal following in the United States. He is still a dominant influence. He stands for radical reforms to which advancing age has not in any degree weakened his allegiance. As Secretary of State, however, aside from the general influence which he will have as a member of the cabinet, it is not likely that his activities can have any business significance. That his influence will be emphatically on the side of peace, his past record sufficiently proves.

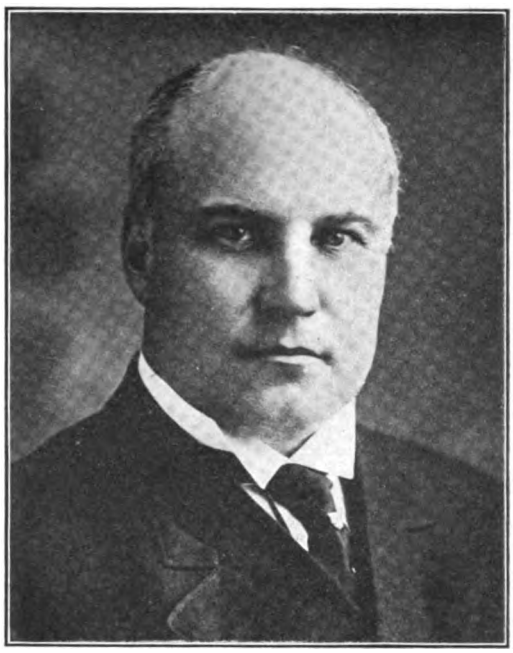
The Secretary of the Treasury, Mr. McAdoo, is a young man who has won distinction as the successful promoter of the Hudson and Manhattan tunnel project. The success of this undertaking has brought him wealth and a high standing among men of affairs. He is entirely acceptable to the so-called money interests, while, at the same time, he has always been noted for independence of thought and action in every relation in which he has been placed.

The Secretary of War, Mr. Lindley M. Garrison, was evidently appointed because of the President's personal knowledge of him. He held the position of Vice-Chancellor of New Jersey for ten years and has made a very high reputation as a careful and conscientious judge.

Attorney General McReynolds is already familiar with the work of the Department of Justice, having been appointed Assistant Attorney General in 1903 by President Roosevelt. In this capacity he had charge of some of the most important cases involving the enforcement of the Sherman anti-trust law, notably the Tobacco trust case. His appointment insures a continuation of the Wickersham policies of prosecution, although it is not yet known whether he will show an equal degree of wisdom to that manifested by his predecessor in agreeing to plans of dissolution which inflicted the minimum damage upon the industries affected.

The Postmaster General, Mr. Albert Sidney Burleson, has been a member of Congress from Texas for a number of years. He has been looked upon as one of the most substantial members of Congress and has been associated with Underwood, Clark and James as one of the House leaders. He is a skillful politician and brings a considerable measure of strength to the new Administration.

Mr. Josephus Daniels, Secretary of the Navy, is the editor of the Raleigh *News and Observer,* a close friend of William J. Bryan, an experienced politician and campaign speaker of note. He has been national committeeman from North Carolina for over sixteen years and has been in charge of the Publicity Department of the last two Democratic campaigns. His appointment was also regarded as a strong one from the standpoint of political influence.



FRANKLIN K. LANE,

Of California, who resigned the Chairmanship of the Interstate Commerce Commission to become Secretary of the Interior.

Mr. Franklin K. Lane, the New Secretary of the Interior, commands universal confidence. As Interstate Commerce Commissioner he has made an excellent record. The portfolio of the interior was the storm centre of the Taft Administration, as the appointment of Ballinger caused President Taft more trouble and was responsible for a large part of the unpopularity of his Administration. It is safe to say that Secretary Lane's administration of this department will not arouse serious criticism.

William Cox Redfield, Secretary of Commerce and Labor, is a prominent manufacturer of New York and has been a prominent figure in Brooklyn politics for many years. He is a vigorous tariff reformer and greatly interested in the expansion of American trade. He is a representative of the best type of progressive business man and his appointment has generally met with approval.

Digitized by Google

WILLIAM HOWARD TAFT,
who again became a private citizen on March first.

The Secretary of Agriculture, Professor David F. Houston, comes from the University of Missouri, and is regarded as in every way qualified to carry on the important work of this department, which is probably one of the most important, although the least involved in controversy, of any of the Government bureaus.

The Secretary of Labor, William B. Wilson, is a representative of organized labor who has served two terms in Congress and is the author of the bill creating the Department of Labor. Aside from this, little is known of him

From every standpoint this Cabinet is strong. Its members, it is safe to say, will prove efficient administrators. Not only that, but most of them are skillful politicians who can be very helpful to the President in presenting his policies to the country, and in securing their adoption by Congress.

The President's Cabinet is well abreast of current radicalism and its members will doubtless cordially second, in their several fields, his efforts to carry into effect the program of progressive democracy. When we turn to the composition of Congress, however, there is much less reason for confidence in the ability of the Administration to carry its recommendations into law. Congress is dominated by the Southern Democracy, and the Southern Democracy is not only very conservative, but it is still dominated by a belief in the sovereign rights of the state as opposed to the power of the nation.

Colonel Roosevelt fully appreciates the situation; he believes, as do other clear-sighted politicians, that the leading political interests in the United States for many years to come will be along the lines of social and industrial readjustment. That this country must follow in the path of Germany and England, and must enact a variety of laws, state wide in scope, for the amelioration of conditions of the poor. Whether Colonel Roosevelt expects to regain power as a Progressive or as a Progressive Republican does not much matter. That he expects to regain power, however, is evident by his continued efforts to strengthen the organization of the Progressive party, and it is a fair inference that he bases his hopes upon the inability of the Democratic party to meet the popular demand for social betterment legislation.

A fair indication of the attitude of the Southern Democracy which will be dominant in Congress, is seen in the opposition to the confirmation of Charles P. Neill as Commissioner of Labor Statistics in the new Department of Labor. This opposition is based, ostensibly, upon reports prepared under Mr. Neill's direction when Commissioner of Labor, reflecting unfavorably on labor conditions in Southern cotton mills. Social welfare legislation, if it is to be effective, must be national in scope, and national action on these subjects from Congress, as at present constituted, will be difficult to obtain.

The main interest in the Democratic program centres in the various projects of economic and business reform which were made so prominent during the recent campaign. First on the list comes tariff legislation. It is the fear of radical reduction in tariff duties that is responsible for much of the uneasiness which now prevails. These fears, in our opinion, are unfounded. Tariff duties will be reduced in many cases; so much is certain. It is equally certain, however, that the present measure of protection which these duties afford is excessive, and considerable reduction can be made without seriously increasing foreign importation. Many Democratic states, such for example as North Carolina and Louisiana, are deeply interested in the maintenance of protective duty. There is, in our opinion, not the slightest reason to apprehend damage to any American industry from the tariff legislation of the present Congress.

It is believed that the new Administration favors the imposition of tolls on American coastwise commerce passing through the Panama Canal. Certain utterances of the President, before his election, point unmis-

Digitized by Google

takably to the conclusion that he is in favor of the strictest possible observance of our treaty obligations, and at the same time, is entirely out of sympathy with a measure which would have the effect of granting an additional subsidy to steamers in the coastwise trade.

RECOMMENDATIONS OF THE PUJO COMMITTEE

Financial interests have been deeply concerned during the progress of the Pujo investigation lest the new Administration would push forward a scheme of radical revision of our banking and currency laws. Of these subjects the average Congressman is densely ignorant and it is always popular to attack the money power. An examination of the recommendations of the Pujo Committee, however, discloses no proposition whose enactment into law need cause any serious disturbance. The majority report, while it claims to have established the existence of a "Money Trust" and to find serious evils connected therewith, proposes a very modest program for the remedy of these evils. The committee proposes to prohibit the consolidation of two or more banks without the approval of the Comptroller of the Currency, to forbid directors serving on the boards of more than one bank in the same locality; to forbid stock ownership in national banks by other financial institutions; to prohibit the voting trust in the control of banks; to provide for cumulative voting in the election of national bank directors; to prohibit interstate corporations from constituting any banking establishment their sole fiscal agents and from depositing their funds with unsupervised private bankers; to prohibit national banks from engaging in underwriting syndicates; to forbid officers of national banks from borrowing from their banks; to provide for publicity of loans made by a director from his bank; to prohibit national bank officers from participating in underwriting syndicates; to limit the number of directors of national banks to not less than five nor more than thirteen; and to provide publicity for the assets and for the stockholding lists of national banks. In addition, the committee recommends that reorganizations of interstate corporations be placed under the control of the courts and of the Interstate Commerce Commission and that railroad security issues should be placed under the control of the Commission, and that provision be made for competitive bidding for these securities. The report also makes certain recommendations concerning

SAMUEL UNTERMYER,
the able Counsel for the Pujo Committee.

the conduct of stock exchanges and clearing houses, attempting to assert the power of Congress over these institutions because they use the United States mail. This is, however, to stretch the authority of Congress altogether too far and there is no expectation that purely local institutions, such as stock exchanges and clearing houses can be subjected to federal control.

As for the recommendations of the Pujo Committee for the amendment of laws governing national banks and interstate corporations, some of these proposed measures might be injurious but, in the main, they could be adopted without causing any serious disturbance or any marked departure from existing methods. There is, however, little prospect of immediate action upon these matters. The conservative majority in the Democratic party is evidently not anxious to grapple with the subject of fiscal reform, and this has been postponed until the tariff question is settled.

Additional railroad legislation is apparently not on the administrative program. Aside from providing for railroad valuation and for a revision of the laws relating to the settlement of labor disputes, no legislation specifically dealing with railway matters is likely to engage the attention of Congress.

It is impossible to derive from a survey of present political control of the United States, any well founded expectations of legislation seriously harmful to business interests. The outlook is, in our opinion, for an administration increasingly distinguished for conservatism in all matters affecting our fundamental business institutions.

J. Pierpont Morgan,

Who Died on the Morning of March 31.

STATEMENT OF J. P. MORGAN AND COMPANY

A conclusive refutation of the arguments presented in the Pujo report is furnished in a letter from J. P. Morgan and Company, written in response to an invitation of the committee. The letter is too long to admit of more than a summary of its main features. The long experience, high authority and recognized disinterestedness of this banking firm gives extraordinary weight to their comments upon the attack which for some months has been in progress upon the American financial system.

The concentration of money in New York, the letter points out, is due to the fact that New York City furnishes the best market for money at the present time, a fact which is, in turn, explained by the defects in the national banking system which automatically compels interior banks to concentrate their reserve funds in New York City. The financial control inevitably resulting from this concentration of money, has not, the letter contends, ever been used either unwisely or unjustly, but in all cases with the highest regard for the public welfare. In this connection the bankers indignantly deny the insinuation contained in the resolution under which the money trust investigation was inaugurated, that certain groups of financiers are able to "create, avert and compose panics." As the letter points out there could be no possible motive for creating a panic in the minds of the men who are thus unjustly charged with this horrible crime, even if their high character and unblemished reputation did not furnish sufficient refutation of the charge.

The extent of the financial control upon which the Pujo Committee lays such stress, is, in the opinion of J. P. Morgan and Company, greatly exaggerated. This control, it was alleged before the committee by its counsel, who attempted to support his conclusion by testimony, is exerted by the system of "interlocking directorates." Upon this point the letter comments as follows:

"For the maintenance of such an impossible economic theory, there have been spread before your committee elaborate tables of so-called interlocking directorates from which exceedingly mistaken inferences have been publicly drawn. In these tables it is shown that 180 bankers and bank directors, serve upon the boards of corporations having resources aggregating $25,000,000,000, and it is implied that this vast aggregate of the country's wealth is at the disposal of these 180 men. But such an implication rests solely upon the untenable theory that these men, living in different parts of the country, in many cases personally unacquainted with each other, and in most cases associated only in occasional transactions, vote always for the same policies and control with united purpose the directorates of the 132 corporations on which they serve. The testimony failed to establish any concerted policy or harmony of action, binding these 180 men together, and as a matter of fact no such policy exists."

In further refutation of the argument that a dangerous centralization of money and credit has been developed, the letter points out that the banking resources of the United States outside of New York have increased much more rapidly than the resources of New York City. In reference to bank mergers, which the majority report proposed to prohibit, the bankers explain these consolidations by the necessity of increasing the size of financial institutions in order to care for the increased demands which the growth in population put upon them. In New York City it is pointed out, moreover, that the largest bank has resources amounting to only three fifths of the largest bank in England, to only one fourth of the resources of the largest bank in France, and to less than one fifth of the resources of the largest bank in Germany. In London there are ten banks with resources in excess of $200,000,000, five such institutions in Berlin and four in Paris. In New York there are only three. In fact, American banks and trust companies have not grown with sufficient rapidity to take care of the business which is offered them. As a result it is necessary for them, in order to handle, for example, bond issues of $100,000,000, to combine and co-operate; otherwise the business could not be done. The demand for increased banking accommoda-

Digitized by Google

tion, in other words, is responsible both for the merger of financial institutions, and for such moderate degree of combination between them as has been reached.

Especially valuable is that portion of the letter which deals with the relations between the private bankers and the corporations for which they act as fiscal agents. A banking house which sells the securities of a corporation assumes a moral responsibility for the soundness of those securities, and to fulfil these responsibilities it is necessary that a careful watch should be kept upon the management of the issuing company, that it should be constantly advised as to the policy of proposed steps, and that the bankers should continually hold themselves in readiness to offer further assistance should that be necessary. A private banker serves as the intermediary between the great corporations seeking immense sums of money for the development of their properties, and thousands of investors who are seeking sound securities for their savings. No other method of marketing securities has ever been developed in this country than to sell them to investment bankers. It is only the strongest corporations whose stocks sell at a high premium, who can sell securities directly to their own members. As long as the investment banker is responsible for the soundness of the securities which he sells it must be conceded that he must be allowed a degree of supervision and control over the corporations issuing these securities.

The Pujo Committee is concerned with the question of competitive bidding for securities. It recommends, as we have seen, that enactment of laws providing for such competitive bidding. J. P. Morgan and Company discuss this point as follows:

"On this matter we are pleased to submit certain considerations which, we are confident, are borne out by the facts: First, in general and over a period of time, the sale of such securities is invariably subject to the competition of market conditions. We have not heard of an instance where any corporation failed to secure the benefit of a price for its issues as excellent as conditions at the time warranted. Second, in most of the leading commercial states, public service commissions pass with great care upon the prices at which the securities of all transportation and public utility corporations are sold. Third, competitive bidding, in the sense of having railroad and industrial securities offered practically at public auction, as in the same of municipal securities, is seldom or never practiced."

The reason for relying upon the banker is that the banker makes the corporation sure of its money, whereas if an appeal were made directly to the investing public the outcome would be very uncertain. The banker is frequently obliged to purchase and carry securities for a long time pending the development of a favorable condition in the investment market which will permit the sale of the bonds at a fair price. As a result of these fiscal agency arrangements between private bankers and corporations, a large amount of corporation money is deposited with these private bankers. Although the private bankers are not subject to supervision, yet in the opinion of J. P. Morgan and Company, the banking partnership whose members have unlimited liability for all of its debts, is a much safer depositary for corporate funds than a national bank or a trust company where a stockholder's liability is limited.

Spurred to action by the hearings before the Pujo Committee, Governor Sulzer, of New York, has presented a program of stock exchange reform to the New York Legislature whose leading provisions we outlined last month. These bills are arousing strong opposition; in particular the proposal to incorporate the Stock Exchange has been opposed. Mr. John G. Milburn, counsel for the New York Stock Exchange, at a hearing before the Senate and Assembly Judiciary and Codes Committee on the bills affecting Stock Exchange transactions, made the following statement which summarizes the objections to this legislation:

"This would be the most unfortunate piece of legislation that could be put on the state's books," declared Mr. Milburn. "It makes it a crime for a man to belong to an association and buy and sell securities if that association is not incorporated. You say that hereafter it shall be a crime for a man to do perfectly legitimate business to which he is entitled by membership in an association for which he paid his money.

"Your bill authorizes the New York Stock Exchange to do a banking business. It doesn't engage in that business, so this is a brand new authority to engage in the business of lending and borrowing money. I'm wondering who wants the exchanges to have that power. No well conducted exchange wants it.

"You want the superintendent of banks to approve all by-laws of the exchange. There's no grievance with respect to our by-laws so this is just another piece of radical legislation for which there is no call.

"Then you provide there shall be an examination by the superintendent of banks of all books of the Stock Exchange. The Stock Exchange has no business for which it should keep books. It buys and sells no stocks, has no money, has no business or orders to execute. I don't see what a superintendent of banks is to do when he goes down there. He can only find the books of indi-

Digitized by Google

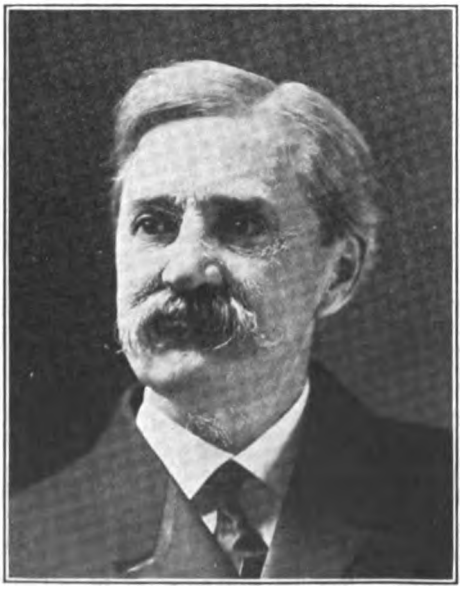
vidual brokers, but they are not the Stock Exchange.

"Now there's your bill to incorporate stock exchanges. You think that all will be white as driven snow after it goes into effect. If ever a mountain labored and brought forth a mouse so far as the correction of evil is concerned it is this bill."

Other speakers urged upon the committees the necessity of not affecting the open market of the exchange by attempting to regulate it through incorporation. They declared that the incorporation bill would not give the state any more supervision than is now enjoyed, while it would rob the board of goverors of the Exchange of the rigid disciplinary powers it possesses.

EFFORTS TO AMEND SHERMAN ANTI-TRUST LAW

It is understood that the Democratic leaders are not in sympathy with the proposal emanating from the Senate Committee on Interstate Commerce to amend the Sherman anti-trust law. This report which is mainly the work of Senator Cummins, recommends that the discretionary power which the Supreme Court now exercises in administering the Sherman law should be taken away from it, and that certain forms of illegal combination should be clearly defined so that business interests may understand what forms of combinations, agreements, contracts or pools are illegal. The report also favors the creation of a commission, similar in many respects to the Interstate Commerce Commission to administer the law.



SENATOR A. S. CUMMINS,

of Iowa, who recommends the amendment of the Sherman Anti-Trust Law.

A more intelligent view of the Sherman law is presented in a statement by former Attorney General Wickersham, made upon the eve of his retirement from office. In a comprehensive view of the subject he claims that the law, as at present constituted, is fully adequate to deal with all trust and monopolistic evils.

After referring to Senator Cummins's proposition to remove "the light of reason" from the Sherman anti-trust act and explaining how the Supreme Court injected that principle into the law, Mr. Wickersham says:

"Now the Senate committeemen who agree with Mr. Cummins, protest against giving a reasonable construction to the act and object to reposing in a court the power of determining whether or not any restraint of trade is due or undue.

"In criminal prosecution under the law the decision as to whether a restraint was undue or unreasonable would rest with the jury. In suits in equity the facts as well as the law must be decided by the court. Since the foundation of the jurisprudence which we have inherited from England such has been the case. Such will always be the case until the English language shall acquire a precision of meaning which it has never had and which the legislative use has never tended to improve.

"The vital principle of the Sherman anti-trust act is simply that every man shall be protected in his right to carry on commerce among the states and with foreign countries without being unfairly interfered with by other men or organizations of men. The interpretation of the Sherman anti-trust law for which Senator Cummins contends would entirely defeat its purpose.

"As interpreted by the Supreme Court, the statute has been held adequate to compel the breaking up of such monopolistic combinations as the Standard Oil, the tobacco and the powder and the great lakes towing combinations; such combinations of coal-carrying railroads formed to monopolize the traffic in and marketing of anthracite coal as those embraced in the recent case of United States versus Reading Railroad Company and others, recently decided by the Supreme Court, and the combination of railroad and bituminous coal companies in Ohio and West Virginia, recently condemned by the court in the sixth circuit; such combinations of competing manufacturers for the purpose of controlling prices and suppressing competition as those of the so-called bathtub trust, the Southern Wholesale Grocers' Association, the Eastern states lumber dealers, the kindling wood combination, the Pacific Coast Supply Dealers, the manufacturers of electric lamps and the window glass manufacturers in Ohio and Pennsylvania.

"It has been held adequate to reach 'corners' or combinations to acquire all or the dominant portion of a commodity with the purpose of withholding it from the market until it could be sold

Digitized by Google

at an artificial price obtained by those in control of the corner.

"Not only have the equitable remedies by way of injunction and receivership been found adequate to break up conditions existing in violation of the law, but the efficacy of the statute as a criminal law in cases of wilful disregard of its prohibition, under circumstances showing moral turpitude, has been demonstrated in the conviction and sentencing to various terms of imprisonment of the officers of the National Cash Register Company.

"Judge Hollister characterized the verdict of guilty in that case as a vindication 'not only of the wisdom and efficiency of the Sherman anti-trust law as it is written, but it is a promise to every man, however small his means, that if he engages in any lawful business which carries his product into interstate commerce the Government of the United States will see to it that he is protected and that the public is protected against conspiracies against his trade and monopolies built upon its destruction.'

"Yet in the face of all this accomplishment Senators talk of amending the law so as to abolish 'the rule of reason' and take from the courts any discretion in construing and applying the law. It would be, indeed, a reign of unreason and madness if such counsels should prevail, and while Senators strive to abolish the rule of reason and thus deprive the courts of a jurisdiction inherent in civilized institutions, the House of Representatives adopts a clause prohibiting the expenditure of any of the funds appropriated for the enforcement of the anti-trust law in proceedings against any labor union—this, too, scarcely three months after the conviction of thirty-eight members of one of the largest and most powerful labor organizations, including its president and principal officers, of criminal conspiracy to violate the laws of the United States regulating in the interest of public safety the carriage of dynamite, nitroglycerin and other high explosives in interstate commerce.

"Yet a majority in the House of Representatives seems willing to put a premium upon crime committed by such an organization by prohibiting the expenditure for prosecution of demonstrated convicted violators of social order, if they are organized in pretended protection of the rights of one class of the community controlling a sufficiently large number of votes."

CESSATION OF HOSTILITIES IN NEW ENGLAND

Opposition to New England railroads is quieting down. The efforts of the leaders of public opinion, who have the interests of New England at heart, are bearing fruit and the past month has seen much less agitation against the railroads. A move in the right direction has been taken by the Boston Chamber of Commerce, which recently held a public hearing, at which "constructive" suggestions were asked, for the benefit of the railroad situation. The net result of the various addresses which were made at the sessions of this conference, was a general agreement that the New England states must put themselves in a position to fight for their commercial existence, and that unless the railroads are able to bring raw materials in at low cost, and depend largely upon the local business and the outward transportation of finished products to earn interest and dividends, New England must fall behind other sections.

Of concrete proposals there are few. It was, however, suggested that the Boston and Maine should be separated from the New Haven and Hartford, and operated under the control of the state. This far-fetched scheme is, however, recognized as impracticable. That New England business men are thoroughly aroused to the danger confronting their interests as a result of the crippling of the New Haven and Hartford and the Boston and Maine by the agitation, is, however, plainly apparent. Major Henry L. Higginson, of the banking firm of Lee, Higginson and Company, voiced the conservative opinion of Massachusetts at the Chamber of Commerce hearing as follows: "Is it the best way, when you want to deal with a man, to give him a kick and then say to him, now we will deal? Or is it better to say—You have done some good things, go ahead and do others. It is two years," declared Major Higginson, "since I asked any one to buy railroad securities, least of all would I touch the New Haven, because of the number of people who are out with a stick. It is the better policy for New England to help railroads."

The committee of the Massachusetts Legislature which is investigating the railroad problem, on March 5th, listened to a strong argument by Mr. William H. Coolidge, counsel for the New Haven, urging the abandonment of the policy of opposition which has been so long followed. Mr. Coolidge declared that the people of New England were, themselves, responsible for the inability of the New Haven management to make the necessary improvements in their facilities. At the time of its consolidation with the Boston and Maine, the New Haven and Hartford presented as its principal argument in favor of the merger, the promise to spend a large sum of money in improving the Boston and Maine's facilities which, it was admitted, were insufficient. From that day to this the politicians of New England have bent every effort to break up the consolidation or to hamper the New Haven's plans for the improvement of the Boston and Maine. In spite of this opposition, however,

Digitized by Google

the New Haven has already spent more than $15,000,000 on the Boston and Maine, and is in the course of spending an equal amount. Mr. Coolidge sums up the situation as follows:

"Commission after commission has advised the Legislature as to constructive work which ought to be done. The railroads and their management have been ready to go ahead with this work as soon as the necessary legislation is obtained, but the railroad critics thus far have been able to prevent the work being done. The real sufferer is New England and not the railroad management.

"Investigations by commissions, state and interstate, grand juries, chambers of commerce and legislatures have taken the place of constructive legislation. Some time the people will be ready for constructive instead of destructive legislation; accomplishment instead of investigation; active improvement instead of criticism.

"The railroad directors and management are ready to proceed just as soon as the Legislature is ready. Already five or six years have been lost, with only a little done. We believe that private ownership under reasonable Government regulation is much better than public ownership of transportation business. We believe there is a much greater efficiency and economy in private than in public ownership. We believe that the manufacturing and business interests of New England demand that the attacks on New England's greatest industry shall stop and that business shall proceed.

"We cannot build tunnels without legislation; it is financial stupidity to electrify the Metropolitan district without knowing how the terminals in Boston are to be finally arranged. We are ready to help if the legislators are ready. We believe the substantial business interests of New England are unanimous in urging constructive rather than destructive legislation. You must decide whether you will take the advice of the railroad management or of the railroad critics."

A long general discussion followed. Members of the committee asked numerous questions about the willingness of the railroads to go ahead and Mr. Coolidge declared that it is essential to have the question determined first whether a tunnel is to be built under Boston to connect the two railroad terminals. Even if the Legislature decides against a tunnel, however, the roads will go ahead with the electrification propositions and four-tracking to which they are committed, but if they can do much more, will depend on which way that issue is determined. When pressed for a statement as to what the company will do if the Legislature decides that no tunnel shall be built, Mr. Coolidge replied rather emphatically that "somebody will decide sometime that there shall be such a tunnel."

Further, Mr. Coolidge argued that there is an awful waste of streets in Boston under existing arrangements when the distant suburbanites are carried in the streets. He said that the people who own the railroads own also the elevated and the street railway and they should co-ordinate all those service lines so that each may perform that part of the service for which it is best adapted.

SLOW PROGRESS IN UNITED STATES STEEL SUIT

The Government has concluded the taking of testimony in the suit against the United States Steel Corporation. The principal witness during the past month has been Mr. James Gayley, a former vice-president of the steel company. From this witness the Government attempted to show that the United States Steel Corporation had long profited on an organized rebate system on ore shipments as a result of which it gained a marked advantage over its competitors, and which tended to strengthen the alleged monopoly enjoyed by the corporation.

It is conceded that the Government has made out its case, so far as concerns the magnitude of the operations of the company and the important position which it occupies in the steel trade. Specific evidence of attempts to monopolize, however, such as was so abundant in the oil and tobacco suits, has been lacking. The evidence has, on the whole supported the contention of the directors and officers of the United States Steel Corporation that the company has always conducted its business with fairness, both to the competitor and the consumer. The formation of the corporation, however, undoubtedly united a number of companies which were formerly competitive with each other, and even in spite of specific acts looking toward monopolization, of which there are practically none, it is not unlikely that the Supreme Court may decide that this immense business organization, with its innumerable alliances and connections, is too large for safety, and must accordingly be broken up.

West Virginia Wins Rate Case.—The Federal Court at Charleston, West Virginia, has sustained the State in the Norfolk & Western two-cent rate case, which has been in that Court for several years. The railroad companies of the State had been charging over two cents a mile for passenger travel and gave rebate checks which were held for the face value in the event the final decision resulted against the defendant company.

Contemporary Opinion

The Situation in New England.

JUDGED from recent editorials in certain New England dailies, the proposed panacea for the railway woes which have been afflicting that section of the country, namely, the disintegration of the system which has been developed under the Mellen regime, is not meeting with the approval hoped for. Not only has it developed that the destruction of this system may seriously affect New England's commercial and industrial position, but the recent rapid decline in the shares of the Boston and Maine stock, provide an object lesson of the financial struggle which this and other lines would be subjected to were they forced to engage in the more costly methods of operation brought about by independent management. Discussing the possible disintegration of the Boston and Maine system, the Boston "Transcript" has had the following to say:

"The sensational decline in Boston and Maine Railroad shares last week, with responsive depression on a few transactions among the shares of leased roads, has led to much talk, not only of passing of the Boston and Maine dividend, but of possible disintegration of the system. Many guaranteed stocks, representing vital parts of the great system, are affected. What would happen if leases were abandoned and various roads were returned to their stockholders? It is not easy to take up independent operation of properties after a long term of practical amalgamation. The needs of the public as well as the roads themselves under which the leases were made are multiplied tenfold in these newer days. Problems of commercial need, of railroad operation and management, of shareholders' interests are more pressing than were dreamed of in the days when the present Boston and Maine system was evolved. Segregation may be the puzzle of the day in the Harriman Pacific case, involving two successful properties. What would it be in the case of the numerous Boston and Maine leased lines when it is admitted that the lessee company is not successful?

"It may be that some revision of the terms of some leases may be suggested as a means of giving some relief from the burden under which the parent company is staggering, but that does not involve segregation or disruption of the system. It is a case of standing if united, of falling if divided—that would seem evident. No such violent effort at solution of the problem seems likely or necessary. Boston, New England, requires the Boston and Maine maintained as a system; the system requires broad consideration from the public served. A generous co-operation, a broad effort at uplift by all parties concerned, and the situation should clear enough to warrant belief in ultimate recovery of the system's standing."

Railway Valuation and Rates.

THERE appears to be a wide divergence of editorial opinion regarding the utility of a physical valuation of railways. Editors, who through experience and training, would appear equally able to discuss this undertaking with a proper regard for the value of the results to be obtained, are disclosing opinions diametrically opposed. Even among railway officials there is no uniformity of opinion, although it has been generally recognized for some time that such an undertaking by governmental authorities is inevitable. The New York *Journal of Commerce* is particularly caustic in its criticism and characterizes the whole procedure as a "ridiculous farce." It says:

"The man more responsible than any other for getting this absurb requirement through Congress is Senator La Follettee, of Wisconsin, and it is amazing that a majority of both parties in the last Congress should have been brought to its support. The only excuse for it is the contention that the Interstate Commerce Commission cannot determine what a reasonable railroad rate is without knowing the actual value of the railroad property. This is the height of absurdity, and it is certain that a reasonable rate cannot be determined by any such method as that proposed. Reasonable rates depend upon the cost and value of the service and not upon the cost of existing property or the cost of replacing it. They vary upon different lines and systems according to situation and circumstances and the efficency of management. On some they may mean a large return upon actual physical valuation and on others none at all.

"The value of any property in use, that for which it can be bought or sold now and upon which its owners are entitled to a return, depends upon many considerations besides what it originally cost or what it would cost to reproduce it, and this is more true of railroads than of factories or trading establishments. If a rule of the kind proposed should be applied it would throw into confusion the whole system of railroad traffic and shift lines of communication all over the country, leaving many of them in ruins. The cost of doing any kind of business has no fixed relation to the physical cost or value of the premises upon which and the appliances with which it is carried on, and reasonable prices for the goods produced or traded in can no more be determined by such value than a lawyer's service can be valued according to his office rent and the cost of his furniture and library. If this task of the Interstate Commerce Commission should be prosecuted for a series of years at great cost to the Government and the railroads, all paid for in the end by the people of the country, the result would be found to be utterly useless for the ostensible purpose. Congress ought to put a stop to the ridiculous farce."

The Firemen's Wage Controversy.

THE comparative lack of editorial support given to the Eastern firemen's arguments in their effort to procure an increase in wages, is surpising in view of the past attitude which has been manifested concerning such controversies. It indicates a growing appreciation on the part of the daily press of the rights of both the employer and the employe and also a fuller recognition of the fact that the demands of railway labor have now reached a point where their claims must be conclusively proven on the basis of a sound economic requirement, before they shall be entitled to more pay. As a leading New York daily puts it:

"Thus far, the argument of the firemen in the

Digitized by Google

arbitration case is not very convincing. Two points have been forcibly made—the one that some investment in equipment and tools is necessary before the men begin work, the other that the hardships of the occupation are considerable. Both points appear to be well sustained, and should be given such weight as they deserve. Neither has much to do with the controversy. Nearly every occupation requires a preliminary investment of some kind, and it does not appear that the firemen are worse off in that regard than are those who follow other lines of employment. As for the hardships of the trade, they would be as great, no matter what wages were paid. The real question is financial, touching the ability of the roads to pay, and has not been dealt with as yet."

Results of the "Money Trust" Investigation.

THE investigation of the Pujo Committee of the so-called "Money Trust," seems to have fallen flat, if a large number of editorials from leading newspapers throughout the country, are to be taken as a criterion. The committee itself, while contending that the existence of a certain kind of "Money Trust" has been proven admits by inference that such a trust, as popularly conceived, does not exist. In commenting on the published statement of J. Pierpont Morgan and Company, which was recently submitted to the investigating committee and which carefully considers every point developed during the investigation, *Financial America*, has the following, in part, to say:

"This document is perhaps the clearest and withal the most temperate and dignified expression from a banking source by way of rebuke to those who hold false and misleading notions in regard to the concentration of money and credit in this country. If any document ever had a right to become historic, the Morgan letter is certainly that one. As a contribution to current economic literature it is potentially valuable. As a model of style, logic, analysis and persuasive eloquence it is unique. Relatively speaking, it is brief. That a subject so wide and far-reaching as the question of money and credit in this country—a question upon which the prevailing ignorance and misconception in the popular mind is positively astounding—could be so comprehensively and intelligently discussed in another triumph for the genius and resiliency of the house of Morgan.

"In language the most temperate this letter points out the mistake of the Pujo Committee in pursuing the theory that a few men control money and credit in this country—a thesis impossible of demonstration owing to the operation of economic laws ever since the beginning of barter and trade when civilization was in its primitive stage. The financial ills which periodically affect this country were shown to arise from an outworn banking system and not from the schemes of men. And the remedy pointed out by the Morgan letter will commend itself to every thoughtful citizen. There was a careful diagnosis of our whole banking system, together with a study of the successful systems of other countries, by the several committees in Congress entrusted with the subject of currency and banking, to the single end of wise and comprehensive—as contrasted with piecemeal—legislation.

"In regard to the elaborate tables of so-called interlocking directorates furnished by the statisticians employed by the Pujo Committee, the letter makes emphatic protest. The implication that 180 bankers and bank directors serving upon corporate boards with resources aggregating $25,000,000,000, absolutely control this huge total is shown to rest wholly upon a false assumption. Living in different parts of the country, personally unacquainted with each other in many cases and associated only in occasional transactions, that they should always vote for the same policy and control with united purpose the directorates of more than 130 corporations is absolutely untenable. The testimony, says the letter, failed to establish any concerted policy or harmony of action binding these 180 men together, and as a matter of fact no such policy exists.

"On the question of decentralization of banking power in this country the letter is equally explicit. It is shown that the country outside of New York is far outstripping that money centre. The banking resources of New York City banks now represent only 18.9 per cent of the country's banking resources, whereas, in 1900 they represented 23.2 per cent."

Public Ownership.

AS the results of a more extended inquiry into public ownership in various foreign countries are available, it becomes apparent that such experiments in the majority of instances, have proven anything but satisfactory, and in several countries, conditions have become so objectionable that a return to private ownership may be expected if the will of the people is carried out. This is particularly true with regard to experiments along these lines in France where railway operations under government ownership have assumed the form of a national scandal. The New York *Journal of Commerce*, in discussing editorially the conclusions recently reached by the well known French economist, Paul Leroy-Beaulieu, after calling attention to the fact that France's experiment with Government railways began in 1875 with the acquisition of certain bankrupt lines in western France, has the following to say:

"These were welded together and linked up with a system extending from Paris to Bordeaux and Nantes. The running of this proved 'very expensive,' and the 'net revenues do not represent two per cent on the invested capital,' while it has had some terrible accidents of late, costing the lives of scores of passengers,' the latest 'due to the bad condition of a bridge over the Loire.' As late as 1908 this small system was developed by taking over the Western Company which controlled roads in several departments, and starting at Paris has as termini the seaports of Havre, Cherbourg, Brest and Nantes. This scheme was adopted against much opposition when the radicals were in power and Clemenceau was at the head of the cabinet. The State management, M. Leroy-Beaulieu declares, 'has been and continues to be a great financial and technical disappointment.' For the first two years 'the trains were never on time and the worst possible accidents were continually happening, whereas under the old management not a single passenger had been killed in ten years.' There has been improvement on the technical side, but the financial results 'could not be much worse than they are and are a great load on the State treasury.' This trial of State

Digitized by Google

ownership, the writer says, 'is directly against that system and consequently public opinion is completely opposed thereto.'"

Electrification on the Pennsylvania Railroad.

THE official announcement made by the Pennsylvania Railroad to the effect that it is about to electrify the Main Line tracks for local traffic from Broad Street station, Philadelphia, to Paoli, has been widely published and commented upon by the daily press who see in it the entering wedge for the eventual electrification of the entire system. In discussing the significance of this action, the Philadelphia *Press* has the following, editorially, to say:

"This is definite and positive and as the Pennsylvania Railroad does not loiter over work once decided upon a beginning of the electrification of the Philadelphia terminus of this great aggregation of roads may be looked forward to with confidence. It is estimated that time will be saved in the passage of trains by the adoption of electricity, but the removal of so many locomotives with their noise and smoke from the city limits will be the chief advantage to the city. That change would be of inestimable value were it not for the vast number of soft coal burning locomotives that will still remain after the trains to Paoli have all been placed under electricity.

"But this good work once begun will not stop. The Philadelphia terminals will ultimately be as free from coal burning locomotives as are those of New York at the present time. The change is bound to come and the great thing for the present generation is to see a beginning made. This is now in immediate prospect. It will go, as we understand, hand in hand with the enlargement of Broad Street Station and the addition of trackage leading out of it on the side towards Arch street. The unresting growth of the Pennsylvania Railroad tends in a short time to outstrip its trackage and stations, but the improvements now in contemplation that are intended to be good for twenty years ought to give most satisfying results and demonstrate the powers of the company's engineers for forecasting the future."

The Commerce Court Question.

THERE appears to be a growing belief that the new Administration may deal more leniently with the Commerce Court than was anticipated, and that its tenure of office may be indefinitely extended. It is known that the Interstate Commerce Commission is in favor of its continuance and that prominent judges, lawyers and shippers are coming to its support. Such pressure is likely to have its effect and it would not be surprising if some measure was adopted authorizing its continuance, though perhaps in a modified form. While it is possible that Congress may make a special appropriation for the next fiscal year, and then leave the court undisturbed, there appears to prevail an opinion, in some quarters, that a change will be provided in its personnel and its jurisdiction.

Discussing the possibility of the abolition of the Commerce Court, a lawyer who has had years of experience in Interstate Commerce Commission practice, says to *The Wall Street Journal*:

"The subject of interstate commerce law and traffic adjustments is one of such intricacy and endless ramification that it is impossible to become grounded in it, save by experience. Under the old system of trying interstate commerce cases in federal courts throughout the country, the judge was usually at a disadvantage because he knew so little of the subject and had his attention directed to it so infrequently. The lawyer who prepared his case the best and presented it most clearly wielded the greatest influence.

"The Commerce Court, with the exception of one of its members, had not had previous interstate commerce experience at the time the court was established, but its members upon assuming their duties, at once embarked upon a most valuable and systematic training, which, if continued, will render them experts.

"If the Commerce Court be abolished, the duties now devolved upon it will necessarily have to be performed by the United States federal courts. Under the old system in effect prior to the creation of the Commerce Court it frequently happened that in cases involving complaints on the part of one city or town against another, the judge who was to try the case resided either in the city or town complaining or in the one against which complaint was made, or else was a resident of a State whose principal towns or whose principal industries might be involved in a case before him. It was, in fact, impossible to avoid this result. It must be apparent that any unconscious bias to which the courts were subjected by reason of this condition has been effectually removed by the establishment of a special court, composed of five men appointed from widely remote parts of the country, and residing in Washington, D. C.

"The criticisms directed against the Commerce Court have tended to create a general impression that the court is antagonistic to the Commission and is in the habit of acting arbitrarily and capriciously. Nothing could be farther from the truth.

"Attorneys for the Commission and the Government who appear in the Commerce Court seeking to have the orders of the Commission enforced, or prevent thei renfrocement being restrained, become as partisan as the attorneys for the railroads who are resisting such orders or seeking such restraining orders or injunctions. The ends of justice are therefore best subserved by trying the cases before a tribunal which possesses as much technical knowledge as either of the contending parties. The lack of such general technical knowledge is necessarily a disadvantage, especially as the court is one in which traffic experts frequently testify orally.

"The agitation for abolishment of the Commerce Court had its inception so early after its creation that the United States Supreme Court had had no opportunity to review all its principal decisions. It is therefore uncertain how far the Supreme Court will sustain the Commerce Court. Suppose it should result that the Supreme Court, upon the leading legal propositions involved, should uphold the Commerce Court. Would not those members of the Congress who are severely criticising the work of the Commerce Court be in a rather embarrassing position?

"It is impossible for the Commerce Court to do any great harm, for whatever may be said of its legal conclusions, its work has been done intelligently and has resulted in placing before the Supreme Court clearly and lucidly the legal propositions involved in each particular case.

The Railroads' Position Concerning Regulation

NOTE: At the public hearing at Harrisburg before the Legislative Committees having in charge the Public Utilities Bill now pending in the Pennsylvania Legislature, Mr. George Stuart Patterson, general solicitor of the Pennsylvania Railroad, appeared last month on behalf of the steam railroads of Pennsylvania. The following is an abstract of his argument.

GEORGE STUART PATTERSON,
General Solicitor, Pennsylvania Railroad.

THE position of the railroads is that:—

1. The bill should endow the Commission with power to secure reasonable rates and facilities. Nothing in the law, however, should contravene the well known statement of the United States Supreme Court that "the public is in no sense a *general manager.*"

The function of management should be left to the railroads themselves. To illustrate: The Commission should have power to insist that equipment be safe and to pass, if necessary, upon the adequacy of the provision made for safety. It should not, however, be empowered to specify the means by which such safety should be secured.

2. The bill should be clear in its meaning, and its language should in general be the same as that of other similar measures which have already received judicial interpretation. In such manner will the railroads understand the precise purport of their obligations.

3. Above all, the bill must be fair to invested capital. It is comparatively easy to force prosperous companies to submit to any burdens which may be imposed up to the point of actual confiscation.

No way has yet been devised, however, by which a man, or set of men, can be forced to embark upon a new enterprise involving the investment of their money unless there is a reasonable probability of profit from the transaction. Capital is volatile. Create unfavorable atmospheric conditions and it vanishes. It knows no national boundary lines. It seeks unceasingly to find a *habitat* where it will be welcomed and encouraged.

Now, through the development of its resources by private capital, the Commonwealth of Pennsylvania has become the premier industrial State in the Union. Railroads and manufactures have here prospered. But it is perfectly obvious that if we impose undue burdens, if we restrict the prerogatives of management, if we penalize efficiency, and make it evident that this State will not allow those who risk their capital here to enjoy the fruits of initiative, enterprise, and industry—no new railroads will be built, and those which exist will make no improvements involving the slightest risk.

In other words, an impasse will develop through the refusal of private capital further to engage in developing our resources, and the public itself through the Government will be forced to embark upon the perilous course of building and managing public utilities.

WHAT GOVERNMENT OWNERSHIP MEANS.

If Government ownership is our goal, we must consider carefully the experience the world has had with Government management. In general, it may be said that no country has as yet undertaken Government railway ownership as a policy deliberately chosen upon economic grounds. Special and local considerations have determined the choice in practically every case.

The most recent instance of this character is that of the Western Railway in France, acquired by the Nation in 1909. In 1909 that company's deficit was $7,750,000; in 1910, $11,700,000; in 1911, $14,000,000; in 1912, $16,000,000; and for 1913, the budget estimates that the people must be taxed $18,000,000 to provide the deficit in railway operation.

In this connection note comment upon the French Government Railway in a letter from the Hon. Evelyn Cecil, M. P., published in *The London Times* June 8, 1912:

"Its enormously enhanced deficit, its greater inefficiency of operation and the insubordination of its staff since it had been taken over by the State, are now notorious. These disastrous results were preceded by a large increase in the number of employes, which has in no way been justified. Under State management, the discipline necessary to the best administration, is disregarded by employes, who are mostly electors, while the pressure brought upon a squeezable Minister to raise wages is highly detrimental to public interest.

Pierre Leroy Beaulieu, a well known French economist, says in *L'Economiste Francaise* of December 30, 1911:

"We see all the inherent faults of State administration in this affair; the abuses of formality and red tape, favoritism, delay, instability, resulting lack of *esprit de corps*, no fixing of responsibility, indifference to financial results."

AMERICAN RAILWAYS BEST IN THE WORLD.

Broadly speaking, the United States has the most efficient railway system of any country in the world. It carries freight cheaper and pro-

Digitized by Google

vides a more satisfactory service to the public than any country in the world.

We do our work upon less capital. The railroad capitalization per mile of road of the principal nations of the world is as follows:

United Kingdom (1911)	$275,156
France (1910)	144,683
Prussia-Hesse (1910)	112,427
United States (1910)	62,657

We do more work upon our capital. This is shown in these figures giving ton miles hauled per mile of line by the leading companies. (England not being given because such figures are not compiled there.)

France	496,939
Germany	827,400
United States	1,071,086

American Railway Wages.

We pay our railway labor better than any country in the world. The following table shows the average daily compensation of railway employes:

United States	$2.23
United Kingdom	1.35
Austria	.89
Prussia-Hesse	.81

The English Board of Trade's official reports show our cost of living (based on the cost of the standard consumption of a typical workman's family) as being 38.0 per cent higher than in the United Kingdom, yet in pay our railway labor receives 60 per cent better wages.

The cost of living in the United States is 17.8 per cent higher than in Germany, yet we pay our railway labor nearly three times as much as is paid in Germany, under government ownership.

American Railway Taxes.

Our railways pay more to the support of the government in the form of taxation proportioned to the capital invested than is paid in any other country in the world.

The railways of the United Kingdom, capitalized at $275,000, paid $1,121 per mile of line in taxes in 1911, while the railways of the United States, capitalized at $62,000 paid $431 per mile of line in 1910. In other words, Great Britain's railways, with a caiptal per mile 4.44 times greater than that of the United States, paid taxes of only 2.6 times as great. *Our taxes were relatively twice as high.*

American Railway Service.

Notwithstanding all of these extra burdens, higher wages, and additional efficiency, the railroads of the United States do their work cheaper than any railroads in the world, as will be indicated by the following table (England not included, since her railways do not compile ton-mile statistics.)

Average Rates for Hauling Each Ton of Freight One Mile.

Year	France (cents)	Prussia-Hesse (cents)	United States (cents)	Group II* (cents)
1900	1.322	1.2474	0.729	0.613
1901	1.327	1.2578	0.750	0.646
1902	1.327	1.2543	0.757	0.664
1903	1.305	1.2543	0.763	0.667
1904	1.296	1.2613	0.780	0.686
1905	1.274	1.2578	0.766	0.665
1906	1.276	1.2543	0.748	0.650
1907	1.231	1.2509	0.759	0.655
1908	1.209	2.2578	0.754	0.643
1909	1.200	1.2509	0.763	0.647
1910	1.203	1.2474	0.753	0.641

*(Pennsylvania, New York, New Jersey, Delaware, Maryland.)

Passenger rates per mile are not given because the low-class rates charged in Europe have no counterpart in this country. First class rates in Europe are generally charged at about 4 cents (American money) per mile; second class, at 2½ cents, and lower classes still cheaper. For the same character of service, the passenger rates in this country are admittedly less than in Europe.

The Necessity for New Capital.

(a) Roughly speaking, the railway tonnage of this country doubles every 10 or 12 years, passenger traffic every 14 or 15 years.

(b) There is necessity for increased terminals, classification yards, tracks, equipment and motive power.

(c) There is the necessity for the expenditure of large amounts out of earnings ($140,000,000 for the Pennsylvania Railroad alone in the next ten years) in non-income producing improvements, such as, elimination of grade crossings, electrification, strengthening of bridges, steel cars, passenger equipment.

(d) In the first seven months of 1912, operating revenues increased 3.3 per cent per mile, operating expenses (exclusive of taxes) increased 4.9 per cent, and net operating revenue decreased .5 of 1 per cent.

(e) Taxes on the Pennsylvania Railroad Lines East of Pittsburgh increased from $3,672,000 in 1903, to $8,597,387 in 1912.

(f) In last ten years the Pennsylvania Lines East have expended $18,000,000 in passenger cars; $99,500,000 in freight cars and $42,400,000 in locomotives.

(g) In last twelve years the Pennsylvania Lines East have expended $188,737,592 in State of Pennsylvania, of which $20,850,000 has been in the elimination of grade crossings.

(h) In last six years, Congressional and State regulation, with reference to hours of labor, safety appliances, standardization of equipment, extra crew laws have cost the Pennsylvania Lines East $11,000,000.

(i) During the ten years (1901 to 1911) there has been an increase in the operating ratio of the Pennsylvania Railroad from 68.68 per cent to 78.88 per cent.

(j) During that same period there has been an increase in wages paid to labor amounting to 37 per cent.

(k) During this same period there has been a decrease in the return upon the money actually

Digitized by Google

invested in the Pennsylvania Railroad property from 6.54 per cent to 4.18 per cent.

It must be obvious to any one that this narrowing of the margin between income and outgo cannot continue much longer, if this and other railroads are to be in a position properly to perform their duty to the public.

Public regulation, then, of public utilities should seek to give every encouragement to private capital while taking all necessary steps to protect public interests. In this connection the quotation from a speech by Commissioner Prouty of the Interstate Commerce Commission on November 19, 1912, is worth quoting and considering:

"The United States is trying an experiment which never has been successfully worked out yet in the history of the world. It is trying to build, develop and operate its railroads by private capital under rates and regulations fixed not by the owners of that capital but by the public."

"Having Eyes That See"

By HOWARD ELLIOTT,

GENERAL MANAGER'S OFFICE, SALT LAKE ROUTE.

HOWARD ELLIOTT,
General Manager's Office, Salt Lake Route.

I MOVE the adoption of the following resolutions:

That, whereas, the railroads of the United States are now confronted with a serious shortage of net revenue, and

Whereas, the increased authority of national and state commissions has narrowed the field through which economies may be practiced until virtually the only flexible method is left by increasing the capacity of the individual employes, and

Whereas, the tendency against over-specialization is both logical and natural: and

Whereas, the "most important part of everything is the beginning" and that, while the specialist may be needed to apply the remedy, any average individual can see the disease;

Now, therefore, be it resolved, by each employe of every railroad in the United States, that he appoint himself a committee of one who, "having eyes that see," will observe what is going on about him, report improper conditions, make suggestions as to improving the service, and in every other way consider the railroad business in the same way that he regards his private affairs, to the end that the roads may be saved from bankruptcy, the country better served, and the stockholders properly recompensed.

The good Samaritan would have made a good railroad man. He had "eyes that see" and he used them. He saw a dangerous condition and he remedied it. If he had stopped to ask himself, "Is this a matter that comes within my department?" he would probably have done just as the priest and the Levite did before him, and passed by on the other side; the man who fell among thieves would have perished, and the world might yet have been waiting for an abiding illustration of "who is my neighbor."

The priest and the Levite are symbolic of the railroad man of the past, the man whose perspective of life is restricted to his "prescribed" duties. The Samaritan is a type of the railroad man of the future, the man who considers the railroad business in the same light that he regards his own, and who thinks it his duty to do anything which will produce dividends for the road, whether it lies strictly within the scope of his employment or not.

Those of us who follow the trend of affairs in the railway field cannot fail to notice certain well defined forces at work. For instance, there is the safety movement, which has for its purpose the reduction of accidents and the amounts paid out for personal injury claims. With the slogan "Safety first" many roads have organized safety committees, lectures have been given, moving pictures displayed, literature distributed, and other steps taken to create in the minds of officers and employes the necessity of "having eyes that see" and of using the utmost care and caution, primarily to avoid the suffering and hardship which inevitably follow in the wake of personal injuries, and secondarily to reduce the enormous amounts continually paid out in consequence thereof.

Closely akin to this movement is that designated as "stopping the freight claim leak." One road has appointed an assistant general manager who gives especial attention to this work. On that line the handling of O. S. and D. reports and claims for loss and damage have been transferred to the operating department. A salutary reduction in claims and claim payments has been made and a system devised whereby all the information necessary to settle a large portion of the claims is in possession of that department at the time the claim is received. Other roads have put on transportation inspectors whose initial purpose is to inquire into and report on conditions which cause

Digitized by Google

claims and to remove so far as possible those causes. Still other roads are treating the same question in different ways.

Then there is the saving habit. One road issued a short time ago a schedule showing in terms of ton miles the expense caused every time a postage stamp is wasted, or a broom or a lantern and other articles usually considered of minor importance. The figures were astounding. One road has adopted the slogan "Save a nickel a day," another "Save a penny a day," and other lines by other means are attempting to inculcate principles of economy in the minds of all.

A campaign of courtesy has also been started. There was published on one road recently a very excellent circular to impress upon agents and others the fact that courtesy costs nothing, but yields large returns in the way of friends for the road. This circular was copied by other roads, which instituted like campaigns. One road has, I understand, appointed an inspector of courtesy, who devotes his entire time to instructing employes how to be courteous and to have manners that please.

There are a number of other movements, such as the establishing of employes' magazines, as means of imparting information to the rank and file as to what is going on, attracting their attention to their own possibilities and developing a spirit of loyalty; the founding of bureaus of economics to compile data with which to contest unsound economic theories; the instituting of a policy of publicity regarding railway affairs, which proceeds on the assumption that suppression of the facts is a wrong and is resented by the public; and the formation of traffic associations composed of both railroad men and shippers, whose object is to minimize their differences and magnify their common interest.

All of these movements were started with the object of developing and increasing efficiency, and the noteworthy fact about it is that the instructions covering all of these matters urged employes to look about them and make suggestions whether it directly concerned their department or not.

But there is one movement that stands head and shoulders above all the rest. Indeed, in a sense, it includes all the rest. Compared to the others, it is as substance to form. It is as much more important than the others as the spirit of the law is of more consequence than the letter. I refer to the pronounced tendency against overspecialization and overcentralization of authority. The trend of the times nowadays is distinctly in the direction of decentralization. Many roads are making the division the unit instead of the department. A broadening of the vision of men follows as the night the day. There is no disputing the fact that this tendency exists, and is finding expression in one form or another every day on some railroad. The only point of argument is whether or not it is a step in the right direction.

Now it is not my purpose to describe the unit system of organization. My friend Major Hine of the Harriman line has done that most admirably. As a pioneer he advocated some startling innovations which have aroused much discussion, but which are being rapidly adopted, once their real import is comprehended. When the safety committee idea was first broached, a good many members of the old school referred to it as a huge joke. How different now! There is nothing so painful to the average mind as a new idea, yet even the "mossbacks" must admit that new conditions demand new methods of treatment, and who will deny that railroading nowadays is far different from what it used to be?

It has been but a few years since lower rates were accorded patrons who shipped in trainloads over those who shipped in carloads. No one thought of questioning the right to do it. Only a short time has passed since railroad managers were the judges of who were entitled to ride free. Even young men in the business may remember when cars were held without demurrage as long as the shipper desired. It has been only within the last five years that a railroad could not protect a rate quoted in error but in good faith. In 1907 the sixteen-hour law became effective, prior to which time an appeal to the loyalty of men was sufficient to cause them to get their trains into terminals, even though they had met with extraordinary delays. Only within the last three years have we heard much about "full-crew bills." In short, the law of "supply and demand" so far as it relates to railroads, has been repealed in many of its essential features within the last decade. The situation has changed and methods of organization and operation must likewise be changed to meet the new conditions.

The opposition to the theory that a man in one department may possibly have an idea that is valuable with regard to some other department is founded either in prejudice or ignorance. The prejudice is begotten of ignorance, but rapidly subsides under a system of enlightenment. I maintain that the theory of broadening men is entirely logical and practical, and that their efficiency is increased to the extent that their vision of departmental boundaries is dimmed. But disregarding the question of whether efficiency is promoted by going outside of one's department, this is at least true, that for every instance where the specialist is indispensable, there are ten instances where any man of common sense will do, and that even if it is necessary to call the specialist to apply the remedy, it doesn't always require his presence to discover the disease, and the discovery is of prime importance.

Let us take this case, to get down to "brass tacks." A traveling freight agent, walking down the track, discovers a broken rail. Knowing that he alone possesses the information, he says nothing about it to any one and an oncoming train plunges to its destruction. Now reporting rail failures is not one of the "prescribed" duties of a traveling freight agent, yet is there a man among us who would not say that the traveling freight agent was guilty of criminal carelessness and gross negligence? But negligence is defined as "the inadvertent failure to perform a non-contractual duty," and if there was no duty there was no negligence. If there was negligence—and we are agreed that there was—then there must have been a duty. It follows then that there may be duties which are not "prescribed," and right there we find the "rub." I say it is a railroad man's duty to do anything which will further the interests of the railroad, and there is not nearly so much danger in encouraging this idea as there is in following the time-worn advice, "Stick to your knitting." If the traveling freight agent had done that when he found the defective rail, what would have been the result? Could he have justified his failure to report the defect on the ground that he was not a track man and could not re-

Digitized by Google

place the broken rail with a sound one? Does his act lose any of its value because it came from one whose principal business was not that of rail mending? And could the roadmaster take offense because the suggestion came from outside the department of maintenance?

I say we need a change of heart if we harbor such ideas. But, says one, do you mean that if a clerk in the auditor's office discovers an intoxicated engineer on his run, that he should report it? I most assuredly do. Such a case may be fraught with graver danger than the broken rail case. Do you mean that a civil engineer should solicit business? Exactly, and some roads are now publishing the names of every one outside the traffic department who secures passengers or freight shipments. Yet solicitation is not one of the prescribed duties of a civil engineer. Do you mean that a section laborer who sees cars on a blind siding unnecessarily delayed, should report it? I do, for maybe he's the only one that knows about it. His pay comes from the same source as the car accountant's. Why should be stand back on ceremony and decline to do things merely because he won't be censured if he doesn't? Do you mean to obliterate departmental lines entirely? Yes, if their maintenance demands that every one else keep hands off and not be concerned with the success of the property as a whole.

Another thing. No man lives who can place his finger upon a single feature of railroad operation which does not concern more than one department. Sitting around a general manager's desk to-day you will find besides the general manager, the general superintendent, the superintendent of motive power and the chief engineer, discussing the advisability of purchasing some Mallet engines. Now if there is any one feature of operation that suggests its own allocation, it is an engine, which every one knows belongs to the mechanical department. Why then is it necessary to go farther than the superintendent of motive power for a recommendation as to the purchase of locomotives? Because when you consider the increased tractive effort, you are looking at it from the standpoint of moving tonnage in larger train units, and this is something that directly concerns the general superintendent and the superintendent of transportation. But during the discussion it develops that to employ this larger power will mean heavier rail, better ballast, stronger bridges. Does it not then become an engineering matter?

But mark you, out of those four officials, there is only one with the proper attitude. The head of the motive power department looks at it only through mechanical eyes. The general superintendent naturally disregards factors which cannot be expressed in "ton miles." The chief engineer pictures only the physical characteristics involved. Not only is there but one man with the right attitude, there is only one man who is in position to say whether or not the purchase of such an engine is true economy. He is the general manager. But the general manager was not always general manager. He came from the ranks. Can any one argue that a general manager can highly specialize up to the day of his appointment and then in an instant of time blossom out into a full fledged executive officer with a "discussable" working knowledge of all the other departments? Such a proposition is untenable. Then at what point in the career of railroad men should the broadening process commence? I say it should begin the moment he takes service with the railroad. He should be taught to "have eyes that see" not only his own particular activities but those of other departments as well, in order that he may develop the proper perspective and fit himself for those positions where they speak of "our road" and not "my department." When we can grasp the force of this idea, at that psychological moment departmental lines will vanish.

When the Titanic went to her watery grave a few months ago, to the world's amazement, it was found that many of the seamen could not row. Seamanship had become such a highly specialized calling that it was thought unnecessary for employes of steamships to know how to handle a rowboat. If those two railroad officials who lost their lives in that catastrophe could speak to-day is there a particle of doubt in your mind and mine what they would say about the dangers of over-specializing?

This tendency to destroy sectional lines is one of the most encouraging signs of the times. It promotes loyalty, it generates the "team-work" spirit, it creates an esprit de corps, it enables employes to tell what is true economy, and if followed to its logical conclusion it will produce dividends, for which purpose and the serving of the public, railroads were established.

Restrictive Legislation.

IN a recent address at the annual dinner of the Railroad Men's Improvement Society of New York, G. N. Orcutt, assistant to the president of the Erie Railroad, stated that while the railroads of the United States were performing an incalculable service to the country, they were constantly being subjected to unfair and discriminatory legislation. In discussing the terminal situation at New York, Mr. Orcutt said:

"The railroads entering New York, by way of New Jersey, did not approve of the recent plans advocated by the city relative to terminals along the North River, because they are obviously unfair. We were courteously invited to co-operate with the city in the matter, but the co-operation turned out to be that of the lion and the lamb."

In reply to a statement of John Purroy Mitchel, president of the Board of Aldermen, who spoke before Mr. Orcutt, that "the day is coming when the North River water front must be taken over for maritime purposes," Mr. Orcutt said:

"During the last year the railroads brought 43,000,000 tons of freight into New York, as against 31,000,000 tons brought in by the combined steamship companies. This fact seems to be overlooked. Yet it presents a striking instance where justice ought to be accorded the railroads."

"Congress has dealt most unfairly with the railroads," he continued, "in the laws regulating the postal service. By the introduction of the parcel post the Postoffice Department has greatly increased its profits, while the railroads, which alone make these profits possible, have not been adequately repaid for the extra service."

What Regulation Taught One Regulator

By HON. JOHN B. OLMSTED.

PUBLIC SERVICE COMMISSIONER OF NEW YORK STATE IN CONNECTION WITH HIS RETIREMENT FROM THAT OFFICE, WHICH HE ENTERED WITH AN ANTI-CORPORATION VIEW.

I CAME into office with decided leanings towards the anti-corporation view of public utility questions. Some of my good friends among the corporation lawyers in Buffalo were kind enough to say that I was too much of an anarchist to be of much use as a commissioner. Want of knowledge as to the precise point involved I have found in many cases to be the principal cause of the prejudices I then entertained. Experience has taught me that there is another side to these questions, and one not lightly to be dismissed.

For instance, I held the view, as I imagine many another person holds the view, that the New York Central Railroad is grossly over-capitalized, and is paying dividends on a large amount of what is popularly known as water. When it came to my knowledge as a part of the evidence of a long investigation in the Buffalo, Rochester and Eastern case that the estimated cost of that company's 300 miles of railroad from Troy to Buffalo, planned without adequate allowances for terminal yards and facilities at either end, and touching but one or two large centers of population, was approximately one hundred millions of dollars, I came to the view that the New York Central, with its four tracks running through the heart of so many great cities of the State, with all the attendant advantages to freight and passenger business, and with approximately 500 miles more trackage, including the vast and valuable terminal facilities of New York City, might possibly on a valuation measure up to a capitalization of five times that of the Buffalo, Rochester and Eastern.

HONORABLE JOHN B. OLMSTED.

MANAGERS CONCILIATORY.

I have changed my mind also as to the attitude of most corporation managers towards the public. I had expected to find it recalcitrant and objurgatory, which is a Latinized and "more tenderer" way of saying that it was made up of kicks and damns. I have found it almost uniformly, when expressed in the presence of the Commission, conciliating and willing to abide by the results of a fair hearing. The difficulty with me has been not so much in getting the corporations to do what I thought was right as to determine in my own mind what under all the circumstances of certain cases was right.

I am fully aware that this is not the popular view of public service corporations, nor do I wish to be understood as having discovered wings on the shoulders of the managers thereof. I say that a better knowledge of the conditions under which their business is carried on brings one to a more just appreciation of some of the difficulties under which they labor. I know well that there are many—very many— particulars in which the service which they are rendering may be improved, as I know well that there are very many particulars in which the business of every man in this room might be improved if an inquiry into it were started by a commission armed with power. Such a commission would be at once met with the objection that its suggestions required too much of an outlay to carry them out, and would be asked how it proposed to provide the funds for the improvements recommended. Let us be reasonable as well as critical. Let us realize that the management of one thousand men on a street car line is no less difficult than the management of an equal number in a factory, and that there are times when you have to do the best you can with the material with which you have to work.

"STRAIGHT" STREET MORE POPULAR.

I believe that in the past ten years a great change has come over the minds of men who are in the management of public utilities. There are still some left who cling to the old "public-be-damned" idea, but they are fast being supplanted, and the up-to-date railway or electric light official stands ready to listen to any reasonable complaint that may be brought to his attention, and, what is more to the point, to turn a deaf ear to proposals which call for abhorrent and forbidden methods in their accomplishment. I am not innocent enough to believe that all the dark, devious and easy ways of "getting there" have been wholly abandoned; but I do hold the view that the street called "Straight" is a much more popular thoroughfare than it used to be, and that the directors and agents of the corporations over which we have control are walking it with much cleaner consciences and with great gain to their self-respect.

RISKS OF INVESTMENT.

I have intimated that one great difficulty with certain corporations is the lack of means to carry

Digitized by Google

out the improvements to service which their operating men admit would be advisable and desirable. On this point some figures from our last annual report may be illuminating. Out of 78 steam railroads reporting to the Commission in this State, only 27 paid any dividends for the current year. Out of 364 electric railroads, light, heat and power, and gas corporations, 237 paid no dividends. In 1909 it was 237 out of 310, so that conditions are improving some; but the figures are significant. They are contradictory to the general impression that dividends are the foundation upon which all public service corporations are erected, and they have a sobering effect upon an official who starts in with the idea of building Rome—or even Schenectady—in a day.

The consideration of them has not swayed the mind of the Commission where conditions have become intolerable or even irritating; but they have at times prevented the attainment of ends which otherwise might have been ordered.

I know that these views are not wholly popular, and I know that in certain quarters the idea prevails that a public service commissioner should be pictured with a knot of thongs to lash the sides of all the hated corporations, irrespective of their merits or deserts. In my view that savors too much of "Donnybrook Fair." I like the expression of President Taft, who quietly reminded his hearers on one occasion, as I recollect it, that the phrase "all the people" means just what it says, and that "all the people" included also the corporations, which are made up of people just as much as a municipality is.

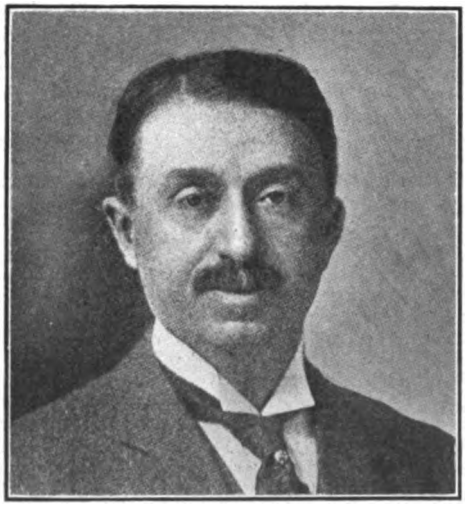
Even-Handed Justice.

The Public Service Commission is organized to hand out justice as near as it can determine it, both to shippers and to carriers, to consumers and to producers, and if it has attained some success in its work of the last five years, it has done so by strict adherence to that view, and not by spectacular brandishings of the "big stick." It has accomplished more good by getting both parties before it, pointing out the strength or weakness of opposing views, and then appealing to that sense of fair play which is inherent in every man, than it ever has by a display of the tremendous powers which the law undoubtedly confers upon it.

A Trip to The Panama Canal

By FRANK TRUMBULL.

NOTE:—In a most delightful manner, Mr. Trumbull records some of the impressions received during his recent trip to the Panama Canal. In his memorandum, railroad officials will find material of a highly entertaining character, particularly in the consideration given the human element in the construction of the Panama Canal as compared with its influence in general railway construction and development.



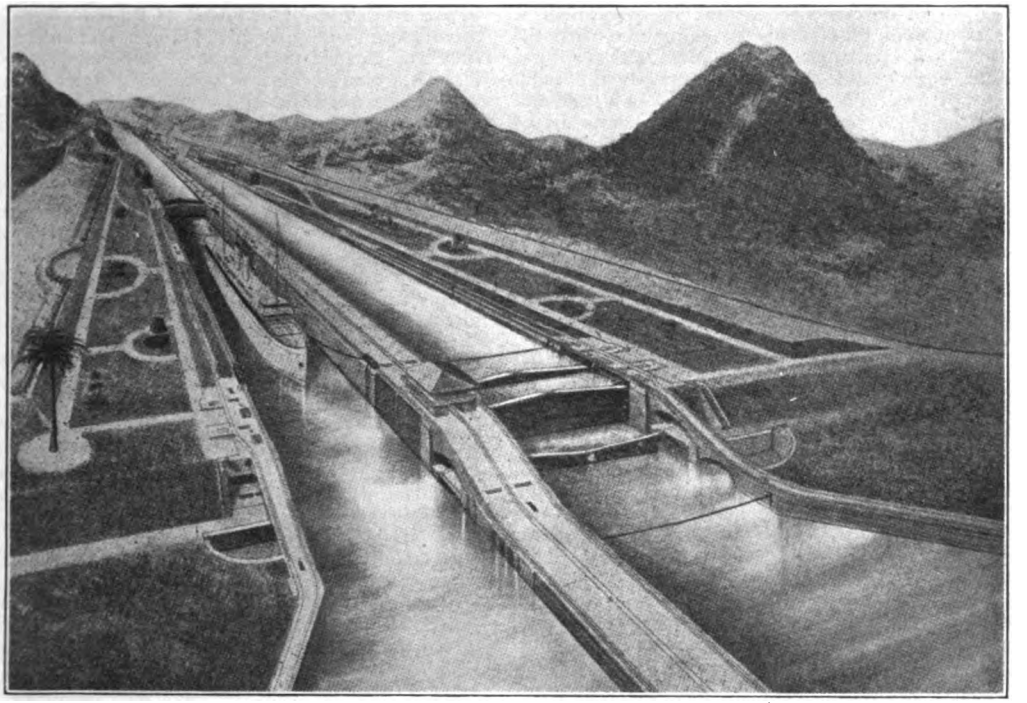
FRANK TRUMBULL.

THE things that interested me most were the human, not the physical features of the work and I am glad on that account that we had six days instead of only two in the Canal Zone. I leave to others a description of the number of cubic yards of excavation, the number of barrels of cement, the bust measure of the locks and the canal, and all those corpulent and really imposing things. You can see steam shovels at home; there are simply a hundred of them there, masticating perfectly good landscapes, and some of the landscapes, particularly near Panama, are charming.

The services of our civilians (railroad men, by the way), who initiated our work, are very cordially commended on the Isthmus. After getting the work started the transfer of it to the Army, was no doubt a good move, because it has given stability to the whole affair; the organization and discipline are splendid. This illustrates the value of appointments for life in the Army and Navy, and of military standards of conduct, instead of the scattering of energy through the temporizing and terrorizing methods connected with governmental work at home in nation, state, county and city. The physical work is a much simpler problem than it was for General Dodge to build the Union Pacific Railroad in 1867-1869, or for the Pennsylvania Railroad Company to get from New Jersey to Long Island under the Hudson River, the East River and New York City, and to build its splendid terminals in New York; and less difficult than to build the subways in New York City.

In computing the value of what we got for the forty million dollars we paid the French, our Government jots down the stock of the old and inadequate Panama Railroad at nine million dollars, which is nearly two hundred thousand dollars a mile, and we are spending about two hundred thousand dollars a mile more to relocate and rebuild most of it. The average capitalization of United States railroads is about sixty thousand dollars a mile. The gross earnings of the Pana-

Digitized by Google

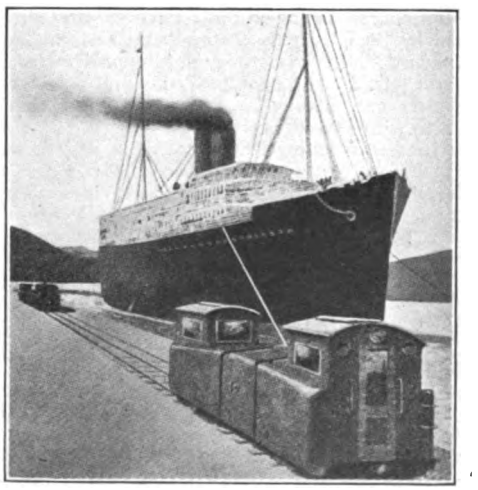


(From the Official Hand Book of the Panama Canal.)
VESSEL PASSING THROUGH PANAMA CANAL LOCKS.

ma Railroad are about ninety-two thousand dollars a mile per annum—as against eleven thousand dollars a mile average in the United States. The first class passenger rate is five cents a mile and its average rate per ton mile four cents—as against an average of three-fourths of one cent per ton mile in the United States, and when the railroad was threatened with congestion the company simply notified prospective patrons that they would not take any additional business!

The railroads of the United States are spending more every year for improvements, additions and new equipment to take care of expanding business than the whole expenditure in ten years on the Isthmus. Two railroad companies alone have invested in terminals in New York City and vicinity in the last few years one half as much as the entire cost of the canal. The City of New York is spending for a new water supply about half the amount of the canal cost, and you can see this immense work in a very agreeable motor trip from New York City. Please understand that I do not disparage the canal work at all. It is superb. To say anything less would be not only ungracious but unfair. It is well to have enthusiasm but it is also well to have perspective and it is fruitless to travel if you do not compare this and that and assemble conclusions, and so I could not forget that our railroads at home also represent the achievements of our own countrymen, who have always hanging over them the burden of sustaining their credit—a spectre unheard of in the Canal Zone.

But there is a halo around the canal, because the nation as a whole is digging it and a pilgrimage there is not only worth while, but patriotic. The chairman of the Congressional Committee said, in opening the hearing at Ancon, Canal Zone, on December 18, 1911: "The people seem to be impressed with the opinion that we are about to realize the hope of the ages in the consummation, under Providence, through the instrumentality of American brain and energy, of the greatest achievement of all time—the joining of the two oceans through the Isthmus of Panama—for the benefit, primarily, of our Army and Navy, and, secondarily, for the benefit of the commerce of the world." The canal will doubtless increase the efficiency of the Navy—some say its efficiency will be doubled—and yet we are building more battleships instead of more railroads. So far as



(From the Official Hand Book of the Panama Canal.)
ELECTRIC LOCOMOTIVES TOWING STEAMER THROUGH PANAMA CANAL.

Digitized by Google

the "commerce of the world" is concerned, it seems evident that European commerce with the Orient will continuue to go through the Suez Canal, because on that route it passes the front doors of nine hundred millions of people, and not until the ships reach Japan and the east coast of Australia do they arrive at the line which is equidistant via Suez or via Panama from Liverpool. The commerce in the part of the globe which lies between Panama, on the one hand, and Japan and Australia, on the other, is almost *nil*, for it is nearly all ocean. The trade routes of commerce to and from the west coast of South America will, of course, be changed, and doubtless there will be some shifting of trade centers in the United States.

It is expected that the first boat will be put through the canal about September, 1913, and that they will be ready for general business about a year later. I think that the effect on commerce of the United States, at least for the first few years, has been very much overestimated by people all over the country. The tonnage per annum which Government representatives estimate will go through the canal for the first few years is far less than that which goes through the Soo Canal connecting Lake Superior with Lake Huron; it is not even as much as that now being hauled by the Chesapeake and Ohio Railway. The canal will cost about three hundred and seventy-five million dollars and the result of that expenditure is placed without money and without price at the disposal of our coastwise commerce—to compete with the railroads. Outside of any question of violating the integrity of our pledge to other countries (concerning which Great Britain has already filed a protest), the ordinary railroad mind is, perhaps, too dense to perceive why after giving United States boats a monopoly of the coastwise commerce as against outsiders, and quarantining the canal against all railroad owned boats, we should also pay the owners of the coastwise commerce lines a rebate. By rebate, I mean the remission of tolls. The practical effect of this "special privilege," is, of course, to increase the burden on other commerce, or to increase the deficit from year to year in the interest account and maintenance and operating cost of the canal —a deficit which must be made up out of the public purse by taxation. Part of the latter is paid by the railroads through the Federal income tax, and, indirectly, through the protective tariff —and part by the people of the States like Iowa, Kansas and Montana, far away from the seacoast, who would perhaps be glad to have more railroad employes. Query: why are railroads expected to be self-supporting and the canal not expected to be? The interest, and cost of maintenance and operation of this fifty-mile canal will at first amount to at least one dollar per ton of steamer contents. The Chesapeake and Ohio Railway furnishes the equivalent of a canal in the shape of a highway across the Allegheny Mountains, and besides, carries the freight itself in its own vehicles an average distance of two hundred and fifty-six miles for $1.04.

The Canal Zone area is about four hundred and forty-eight square miles, of which about twelve hundred acres (adjoining communities of people) are sanitated and that costs about five hundred thousand dollars a year. The towns of Colon and Panama are cut out of the Canal Zone and are a part of the Republic of Panama, but our Government reserves the right to enter either of them for the purpose of sanitation, or to preserve order. The towns of Panama are very picturesque and foreign looking, particularly as they are cleaner than most of our American cities. This transformation of a fever-stricken Isthmus into a healthful and even salubrious place of residence is one of the events of the world. The previous discovery that yellow fever is transmitted by mosquitoes, was a great boon to humanity. It is said that the maximum flight of the mosquito is three hundred yards when not blown by the wind, and you cannot help wondering why if mosquitoes can be regulated in the Canal Zone they are not also regulated in New Jersey. The hospital buildings and grounds at Ancon are very attractive in appearance and beautifully located. When the French were doing their work on the Isthmus it was the custom to have nurses on duty only during the day. The patients who were the worst off, were taken care of in some sort of fashion at night by the convalescents. The French counted on large losses of life from yellow fever just as they expected large human sacrifices, when they went to war. Negro as well as white laborers are well taken care of in the hospitals, are tucked up in nice clean sheets and attended by white nurses. The Subsistence Department is another fine piece of work for the welfare of the employes. It supplies them with food, clothing, etc., at low prices and does a business of about seven million dollars a year in a very business-like way. It buys wherever it gets most favorable terms, and without paying any duty. Query: If it is good to reduce the cost of living in the Canal Zone, why not at home? It is fair to say that preference is given to the United States, but about one-seventh of the purchases (in money value) are made in other countries. The negro laborers, get only ninety cents a day, but are furnished three good meals a day for twenty-seven cents. Sirloin steaks from Chicago via New York are sold at retail at twenty cents a pound. There is almost no fresh food on the Isthmus, and so practically everybody uses cold storage poultry, cold storage eggs, evaporated milk, etc. But everything is of excellent quality and well supervised for the general welfare. One of the first effects in the United States of the completion of the canal will be to diminish these large purchases.

I have come back from the canal impressed over again with the versatility of my countrymen. On the Isthmus we are patiently and unselfishly caring for the welfare of thirty thousand negroes (mostly from Jamaica) and ten thousand other employes—we are doing everything well—while at home we are impatiently and selfishly doing so many things badly. Therefore I say when you go to Panama, take along your white duck suits and your sense of humor; that is, a power to perceive our own political incongruities. And perhaps you will come home feeling both proud and humble. The canal work is a fine case of governmental ownership twenty-five hundred miles away from the politicians. The mosquitoes have been banished—and equal suffrage and the predatory politician have not yet arrived. We hear a great deal in the United States about the "Rule of the people," but when we want to do a really big thing in an efficient way we "rule" by putting it in charge of an autocrat like Colonel Goethals—a benevolent autocrat, it is true, but, nevertheless, an autocrat and not subject to the initiative, the referendum or the recall. I think the chief lesson to be

Digitized by Google

learned from a visit to the canal is that we, like other people, accomplish the best things by centralizing responsibility instead of by dispersing it. Every American should be thankful that our country has produced a Colonel Goethals, a Colonel Wilson, a Captain Wood, whom I met most agreeably—and a Colonel Gorgas and others, whom I had the misfortune to miss. And we should be thankful that in this practical work those in charge have permanent tenure of office instead of being subjected to the infectious breezes of popular misconceptions.

The Use of Hydro-Electric Power in Railway Operations

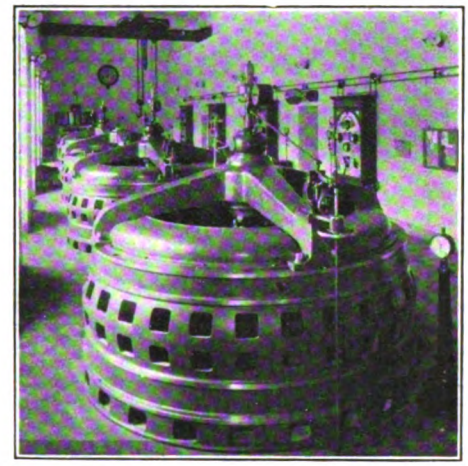
THE increased interest which is being shown in the electrification of steam railways and the report that a number of Western lines are seriously contemplating an installation of this character, lends additional value to any information relative to the successful installation and employment of hydro-electric power in other countries. In fact such power has been successfully employed for many years in a number of European mountain localities and American engineers can undoubtedly gain much of practical value by a study of foreign experiments and developments.

The accompanying illustration shows the power plant at Montbovon, Switzerland, which not only supplies current for operating the Mortreux-Oberland and Bernois Electric Railway, but also for lighting and other service in the neighboring Swiss towns.

The water is supplied from the River Sarine, nearly 20,000 horsepower being developed as a maximum at this plant and the hydraulic station at Hauterive.

There is a dam at La Gine for use in connection with the Montbovon power house, the water being received in the latter from an underground tunnel having a section of over 100 square feet cut through the rock to the pressure chamber above the power house. The tunnel which is nearly two miles long connects with a gravel settling basin at its inlet, while at its outlet there is a concrete tunnel connecting with the river through an overflow and emptying valve.

In the power plant there are four water wheels of the Richter type, developing over 1,000 horsepower at 300 revolutions per minute, working



MONTBOVON ELECTRIC GENERATING STATION.

with an effective head of over 200 feet. There are two penstocks feeding the turbines, measuring nearly five feet in diameter and over 600 feet in length, connecting the pressure chamber with the water wheels in the hydro-electric plant. There are compensating valves installed to open and relieve the excess pressure and avoid water hammer effect, due to suddenly closing the turbine valve; and an automatic regulator working in connection with these compensating valves.

HYDRO-ELECTRIC POWER HOUSE AT MONTBOVON, SWITZERLAND.

MOTOR GENERATOR SETS AT THE CHAMBY SUB-STATION.

The electric generators are of the Aloith vertical type as shown, the fields being excited by two 100 horsepower units, connected with the generator and excitor switch cabinets. The various feeder circuits are connected with a separate switch house. There are moveable panels provided for the feeder circuits without circuit breakers relay. These are of steel plate and structural iron located a sufficient distance from the wall to give space for the leads to the line and the oust bars. On this moveable iron frame work is located the oil switch, with a three-phase series oil transformer which supplies current to the three-pole time limit relay mounted on the base.

The three-phase current is transmitted at 8,000 volts over circuits of copper wire of 50 square millimeters cross section mounted on poles of wood, in triangular form, the conductors being mounted about twenty inches on centers with two three-phase circuits on each pole line.

The Chamby sub-station is shown in the accompanying illustration. This station receives the current at 8,000 volts and transforms it from a three-phase current to a direct current of 800 to 1,000 volts for use on the Montreux-Oberland-Bernois Railway. Three motor generator sets are utilized, each consisting of an 8,000-volt induction motor of 200 horsepower capacity driving a continuous current dynamo of 140 kilowatts at a speed of 430 revolutions per minute.

There is a battery installation employed for regulation consisting of 360 storage cells each having a capacity of 368 ampere hours. This battery receives and stores current during light load and during periods of peak load restores the energy to the railway line.

Personal

Wilbur Chapman Fisk.

Wilbur C. Fisk, who was recently elected president of the Hudson and Manhattan Railroad Company, was born at New York City, 1868. He graduated from Princeton University in 1890, with degree of C. E., and after leaving college, entered the banking house of Harvey Fisk and Sons, founded by his father, the late Harvey Fisk, and became a member of the firm in 1898. Shortly after Harvey Fisk and Sons undertook the financing of the Hudson and Manhattan Railroad Company, at the urgent request of the directors and W. G. McAdoo, president, Mr. Fisk accepted the vice-presidency of the company. His technical knowledge was of great assistance to Mr. McAdoo in the construction of the tunnels and he held the position of vice-president and general manager until March, 1913, when he was elected to succeed Mr. McAdoo, who has been called to serve as Secretary of the Treasury under President Wilson.

WILBUR CHAPMAN FISK.

Alfred H. Smith.

Directors of the New York Central have elected Alfred H. Smith senior vice-president. At the same time they have also made an order authorizing Mr. Smith to perform the duties of president in the absence of that executive. In so doing the board has followed a precedent and extended to Vice-President Smith the same compliment they paid to W. C. Brown, preceding his elevation to the presidency.

Mr. Smith is 48 years old and has been in railroad life thirty years beginning as a messenger in the purchasing department of the Lake Shore. He did not stay there long. Ambitious to qualify himself for advancement and to attain a knowledge of railroading in all its branches he soon joined a construction gang and was later made foreman of bridges on the Michigan division Ultimately he became a division superintendent and in that capacity had charge of two divisions and then was made in 1901 general superintendent at Cleveland. One year later he came to New York in the same capacity on the New York Central and two years later was appointed general manager.

In another three years he became vice-president

Digitized by Google

ALFRED H. SMITH.

and general manager. Last April he was made vice-president in charge of the lines west of Buffalo, in charge of operation, maintenance and construction, both east and west of Buffalo except as to the Pittsburgh and Lake Shore, the Nickel Plate, the Boston and Albany and the Rutland. Now next to the president he is the highest executive officer connected with the system and is thoroughly familiar with all its features of operation and management and having acquired a grasp that amply qualifies him for the important and higher responsibilities that will devolve upon him.

George W. Boyd.

GEORGE W. BOYD, who was recently appointed passenger traffic manager of the Pennsylvania Railroad to succeed J. R. Wood, retired, was born in Indianapolis, Ind., August 1st, 1848. In 1863 he made his entrance into railroad life through the freight department of the Cleveland, Columbus, Cincinnati and Indianapolis Railroad, Indianapolis then being one of the greatest railroad centers in the country. All the east and westbound freight was transshipped there and its freight yards were at all times the scene of great activity. For several years Mr. Boyd served as clerk, and subsequently as chief clerk, of the freight department.

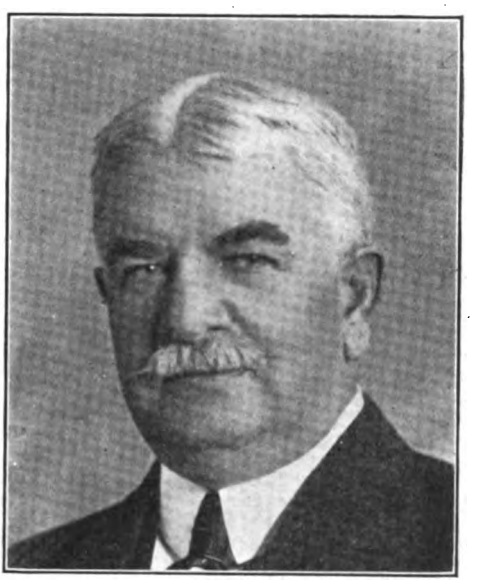
In June, 1872, Mr. Boyd was appointed cashier of the passenger department, Pennsylvania Railroad. He discharged the duties of this office until January, 1874, when he was promoted to the higher post of chief clerk. The chief clerkship remained in his hands for eight years, until January, 1882, when the office of assistant general passenger agent was established, and he was installed as its first incumbent. Mr. Boyd held that position until his appointment as general passenger agent, June 1st, 1903.

Mr. Boyd's work in relieving the passenger business of outside interference and confining the sale of tickets to regularly accredited agents has been notable. He has been an uncompromising foe of the ticket scalper and has advocated anti-scalping laws before committees of Congress, as well as before the legislatures of many States, and thereby contributed much to the legislation on this subject.

His efforts in the field of the development of passenger traffic have been unremitting and comprehensive, and he is the pioneer among railroad officials in the principle that pleasure travel, under the personally-conducted system, is the legitimate business of the railroad companies, and not of the independent promoters.

Coincident with the appointment of a new passenger traffic manager, the Board of Directors has made a complete reorganization of the passenger department, the first important feature of which is the appointment of two general passenger agents, D. N. Bell and J. P. Anderson, formerly assistant general passenger agents. Heretofore, Mr. Boyd had been the only general passenger agent on the Lines East. Under the new organization, one general passenger agent will devote his time to developing travel local to the Pennsylvania Railroad and the activities of the other will be devoted to building up the so-called "through" passenger business.

Division passenger agencies have been created at New York, Philadelphia, Harrisburg, Pittsburgh, Williamsport, Buffalo and Baltimore.



GEORGE W. BOYD.

David Nelson Bell.

DAVID N. BELL, who has been appointed general passenger agent of the Pennsylvania Railroad, was born in Philadelphia, November 18th, 1868. After graduating from the public schools of that city, he entered the general office of the passenger department, Pennsylvania Railroad, July 5th, 1885.

In April, 1891, Mr. Bell was appointed assistant advertising agent, and in November, 1896, he was assigned to duty as tourist agent. On June 1st, 1903, he was appointed special assistant to the general passenger agent. He was advanced to division ticket agent, United Railroads of New Jersey division, on August 1st, 1906, and, on June

J. P. ANDERSON.

D. N. BELL.

F. B. BARNITZ.

1st, 1910, he was appointed assistant general passenger agent, in charge of through traffic.

James Paul Anderson.

JAMES PAUL ANDERSON, who has been appointed general passenger agent of the Pennsylvania Railroad, was born at Beaver, Pa., August 29th, 1862. At the age of twelve years he moved, with his family, to Allegheny, Pa.

Mr. Anderson received his education in the public schools of Beaver and Allegheny. He entered the service of the Allegheny Valley Railway Company, July 15th, 1880, as a clerk in the passenger department. After serving as chief clerk and traveling passenger agent, he was appointed general passenger agent of the Allegheny Valley Railway, June 1st, 1889.

When The Pennsylvania Railroad Company absorbed the Allegheny Valley Railway, August 1st, 1900, Mr. Anderson was appointed division ticket agent of the Buffalo and Allegheny Valley division. On April 1st, 1910, he was made district passenger agent of the Pittsburgh district, and on August 1st, 1912, he was advanced to assistant general passenger agent of the Pennsylvania Railroad Lines East of Pittsburgh and Erie, with headquarters at Broad Street Station.

Mr. Anderson was married to Miss Margaret Dickson Moorhead, May 4th, 1907. He is a member of the Duquesne Club and the Americus Republican Club of Pittsburgh.

F. B. Barnitz.

F. B. BARNITZ, who has been appointed division passenger agent of the Pennsylvania Railroad at Philadelphia, was born at Wheeling, West Virginia, May 5, 1880. He graduated in the class of 1902 from the University of Pennsylvania and entered the service of the Pennsylvania Railroad Company on October 10, 1902, as redemption clerk in the passenger department. He held this position for two months when he was made ticket seller. On June 1, 1903, he was promoted to be file clerk, and on December 1, 1907, was made special excursion clerk. On June 1, 1910, he was advanced to chief tourist agent, and on November 1, 1911, he was made milk agent of the Lines East of Pittsburgh and Erie. On March 1 he was promoted to his present position.

George McCormick.

GEORGE McCORMICK, recently appointed assistant general manager of the Sunset-Central Lines of the Southern Pacific, with headquarters at Houston, Tex., was born July 15, 1872, at Columbus, Colorado county, Tex. He was graduated from the Agricultural and Mechanical College at Bryan, Tex., with the degree of Mechanical Engineer, in 1891. He began railway work in 1891 as apprentice in the shops of the Galveston, Harrisburg and San Antonio at Houston, Tex. In a short time he was transferred to San Antonio, Tex., as draftsman, returning to Houston in 1895 as chief draftsman. He was appointed mechanical engineer in 1900, where he remained until December 20, 1911, when he went to El Paso, Tex., as assistant superintendent of the El Paso division. He held the latter position until his appointment on February 17 as assistant general manager (mechanical) of all the Sunset-Central Lines, as above noted.

GEORGE McCORMICK.

P. C. HART.

P. C. Hart.

P. C. HART, recently promoted to general manager of the Chicago, Milwaukee and St. Paul lines east of the Missouri River, with headquarters at Chicago, has been in the service of the St. Paul road since 1876. He began railway work as section man, and has since filled the positions of telegraph operator, station agent, brakeman, conductor, chief clerk in the superintendent's office, trainmaster, superintendent of terminals, division superintendent, superintendent of construction, and general superintendent, until his recent promotion as general manager.

Herbert S. Balliet.

HERBERT S. BALLIET, engineer of maintenance of way of the Grand Central Terminal and signal engineer of the Electric division of the New York Central and Hudson River, with headquarters at New York, has been appointed assistant manager of the Grand Central Terminal. He continues to perform the duties of signal engineer of the Electric division, and engineer of maintenance of way of the terminal. Mr. Balliet was born in Neffsville, Pa., in 1868, and was for several years a telegraph operator, working both for the Western Union Company and for the United Press Association. He was at one time station agent and operator on the Philadelphia and Reading. He began on the Lehigh Valley as operator, but he soon went into the signal department and was engaged in that department eleven years. He was appointed assistant engineer in 1901. He left the Lehigh Valley to go to the New York Central in April, 1905. For two years, 1905-1906, he was secretary of the Railway Signal Association. He has been one of the most prominent members of that Association from its earliest years, and in 1910 he was its president. In his position at the Grand Central during the past five years he has had charge of the construction of the extensive new tracks and signaling connected with the establishment of the new two-level station.

H. S. BALLIET.

W. A. McDOWELL.

William A. McDowell.

WILLIAM A. McDOWELL, who, on February 15th, was elected to the positions of vice-president and secretary of the Lexington and Eastern Railway Company, has for many years, been prominently identified with the industrial and commercial life of that part of Kentucky in which Lexington is located. He was born in Louisville in 1863, and is a graduate of the scientific department of Yale University.

After a varied experience in engineering and mechanical enterprises, he was made engineer of the Lexington and Eastern Railway Company, a position which he held for a number of years. In 1906, he was elected general manager of this road, and his intimate knowledge of its working, coupled with a fine executive ability, enabled him to maintain the high standard set by his predecessors and to carry out a number of important improvements. On January 1st, the Louisville and Nashville took over the operation of this line, and Mr. McDowell's position was then changed to that of manager of the Lexington and Eastern division.

Financial

Annual Report of New York Central.

THE New York Central and Hudson River Railroad Company enjoyed a prosperous year in 1912. Its net revenue from operations, it is true, remained almost stationary, in fact, showing a small decrease, but the gross corporate income, owing to a large increase in dividends on stocks owned, showed a gain of $126,403. Fixed charges increased $2,951,015, resulting in a reduction in the net corporate income of $1,424,611, but leaving a balance for the year, carried to Profit and Loss of $2,743,372. The total balance to the credit of Profit and Loss as of December 31, 1912, after deducting a large amount on account of discounts, commissions, etc., stands at $13,185,413.

The expenses of the New York Central were increased by the same causes which raised costs on the Pennsylvania. Increased traffic, higher rates of pay, and weather difficulties are responsible for an addition of $5,610,950 to operating expenses. That the efficiency of the property is increasing is seen in an increase in the average train load of 35.4 tons, and in the load per car mile of .7 of a ton. The consumption of fuel by locomotives also decreased.

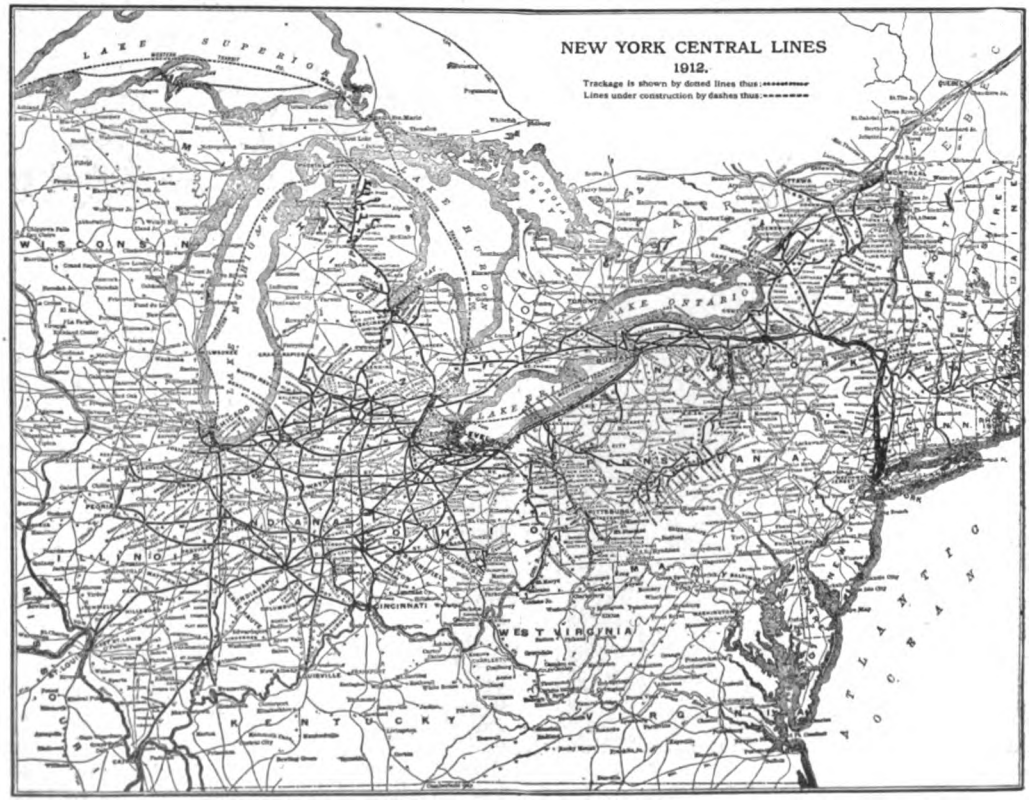
The company has a large amount of improvement work in process, most of which consists of four-tracking and electrification. During the year there was a net addition to the property account of $17,083,899. The report calls attention to the establishment of certain equipment trusts by which the New York Central, in company with its subsidiaries, will become responsible for the payment of about $35,500,000 of equipment trust certificates to be issued from time to time. The equipment of the Merchants Despatch Transportation Company has been purchased during the year.

In reference to the labor difficulties which occupy a prominent position in every railroad report to-day, President Brown quotes extensively from the recommendations of the Engineers' Arbitration Commission, but speaks disapprovingly of its conclusions as to the necessity for compulsory arbitration. "Compulsory arbitration," he says, "of course means that the railroads must submit the questions of compensation and conditions of service of all employes to a commission having no interest in, nor responsibility for, the financial result of the operation of the property.

"For the employe it involves the surrender, to some extent, of his liberty of action in deciding whether the wage he receives and the conditions under which he works are satisfactory or not.

"The proposition is not an attractive one for either the employer or the employe, but it is doubtful if, in the long run, it will not be better for both than the conditions which may arise without some such arrangement for settling controversy."

In this connection it is interesting to note that in 1905 the New York Central paid to its employes 42.4 per cent in wages and in 1912 46.8 per cent. Making allowance for the additional num-



Digitized by Google

ber of employes, the increase in seven years is $9,500,000, an amount equivalent to 4.27 per cent on the stock of the company.

It is indeed significant that this great property, enjoying exceptional advantages from its position, operated with the highest efficiency, was able to earn during the past year only a five per cent dividend on its stock and a surplus of 1¼ per cent.

A feature of the report which is deserving of especial comment, is the following remarks upon the co-operation of the various commissions, with which the company comes in contact:

"Appreciative acknowledgment is made to the Public Service Commission of the State of New York, the Massachusetts Board of Railroad Commissioners and the Interstate Commerce Commission for helpful co-operation in improving the service and in maintaining friendly and cordial relations between the road and the public.

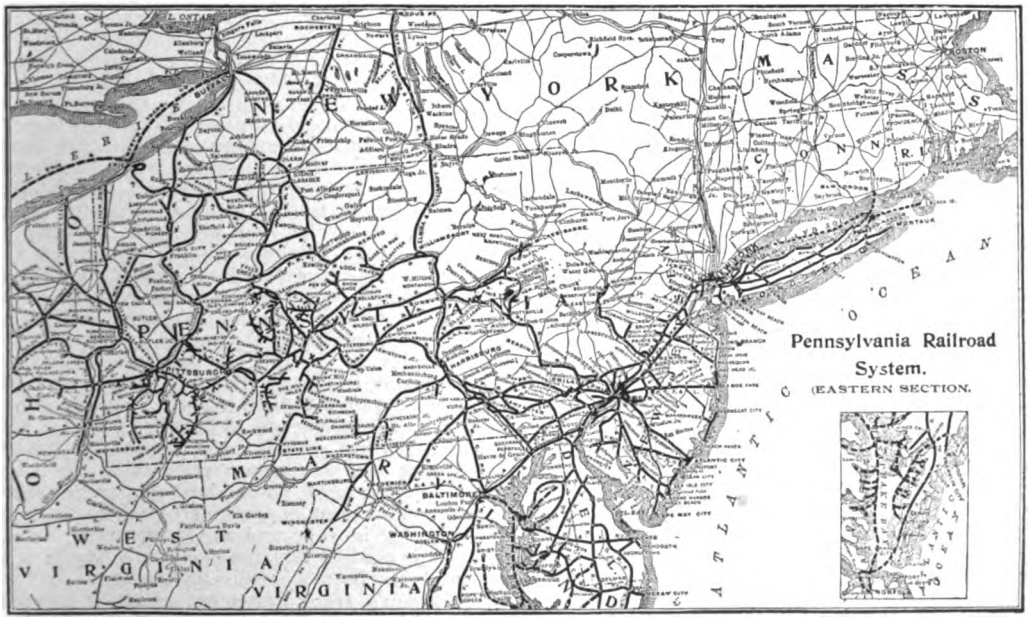
"Especial obligation is felt for the timely and efficient efforts of the Interstate Commerce Commission in expediting the movement and preventing the abuse of cars. The freedom with which an unprecedented volume of traffic has been moved and the absence of any serious car shortage or congestion is due in no small measure to this wise and helpful co-operation."

Annual Report of the Pennsylvania Railroad.

THE Pennsylvania Railroad Company in 1912 enjoyed the most prosperous year in its history, both from the standpoint of gross revenue and from that of net operating income. The gross revenues reached the imposing total of $181,023,693, an increase of $17,120,185 over 1911, and $16,210,868 above the previous high record reached in 1907. Net operating income showed a gain of $3,403,117 over 1911, but was only slightly above the figures reached in 1907. The remarks of President Rea contain a number of points which explain the significance of these figures. The large increase in gross earnings was met by an even larger percentage increase in operating expenses, which showed a gain of $13,409,551, or 11.8 per cent. This increase in operating expenses is not only due to the increase in traffic, but also resulted from the large additions to the cost of repairs and renewals to various portions of the property, and to increased charges for depreciation. The severe weather of the preceding winter, higher wages paid, the operation of the Extra Train Crew Law, increased cost of materials, and betterments to the roadway, are additional explanations of the increase in operating expense.

We have elsewhere referred to the very pertinent although restrained remarks of President Rea upon the labor situation. In spite of the unsettled outlook in this field, the company announces an extensive program of betterments, among which the improvement of Broad Street Station, in Philadelphia, and the construction of three tunnels and extensive grade reduction on the Allegheny division between Pittsburgh, Oil City and Buffalo, are of primary importance. The last mentioned improvements will shorten the available route to Buffalo by over 58 miles, and will postpone for several years the double tracking and other expenditures on the present line.

A conspicuous example of expenditures made in aid of passenger traffic is the proposed improvement of Broad Street Station. This program, when completed, will provide increased terminal facilities and approaches, for approximately twenty years to come, for lines which equal eight double track railroads. No information is given in the report concerning the financial plans of the company, other than to intimate that a large portion of these improvements will be made out of income and added to the reserve for additions and betterments. The only impor-



Digitized by Google

tant capital issue during the year consisted of $7,000,000 of equipment trust certificates.

The Pennsylvania Railroad is on the eve of another period of expansion, forced upon it by the rapid growth of population and industry along its lines. The only deterring influence to the successful carrying out of these comprehensive plans for improving its service, will be the hostile attitude of railway labor, which unless changed, might make the management cautious about incurring new obligations.

Annual Report of the Lackawanna.

OF the anthracite coal roads the Lackawanna, according to the 1912 annual report, earned 38.8 per cent on its stock compared with 39 per cent in 1911. The company has for a number of years made large expenditures out of earnings in the improvements of its property. Renewals and betterments received an amount equal to 7.2 per cent on the capital stock in 1911 and 8.4 per cent in 1910. President Truesdale states in the annual report: "The management believes that the large expenditures for additions and betterments during recent years have added so greatly to the facilities of the company that further outlays in that direction may be reduced quite materially for the immediate future. The company's surplus, after appropriating $1,720,698 to additions and betterments, and $6,028,800 to dividends, exceeded $4,000,000, raising the profit and loss surplus to $29,500,000."

An Uncertain Outlook.

THE United States, at present, is suffering not only from uncertainties connected with the policies of the new Administration, but also because of money stringency which is much more severe abroad than it is in this country. In every country of Europe gold has been hoarded in anticipation of a possible outbreak of hostilities among the great powers. The danger of this is now regarded as remote but the apprehensions excited by rumors of war and preparations for war have resulted in practically drying up the stream of investment funds which normally flows in such enormous volumes out of the current savings of western Europe. As a result large amounts of American securities have been liquidated and a considerable amount of gold has been withdrawn from New York. The European situation, although still unpromising, is now regarded as out of serious danger. The powers have reached an agreement among themselves as to the terms on which the Turkish war will be concluded and there is no reason to doubt their ability to enforce these terms upon the combatants. With the conclusion of peace in Southeastern Europe, it is expected that a large amount of this hoarded money will be released for investment.

The Business Situation.

ASIDE from war and politics there is nothing in the business situation to cause the slightest uneasiness. The report of the iron output for February shows a large production and the continued activity in the steel trade has been a matter of surprise. The railway equipment industry is especially active. It is estimated that the orders now booked by steel manufacturers are large enough to assure their capacity operation for the next six months. Unfilled orders on the books of the United States Steel Corporation show a small decrease, but this is not regarded as serious. The corporation earned during the year a balance for common dividends after all charges, including depreciation and sinking funds, of $29,038,070, or 5.71 per cent on the outstanding capital stock, as compared with 5.9 per cent earned during the past year.

The record of bank clearings, railroad earnings, manufacturing output, and scarcity of labor, all point to a condition of sustained business activity which with the unfavorable influences already noted removed, will make for higher stock values. Securities are now at the lowest average level since September, 1911. With stocks like Baltimore and Ohio, Atchison, Lehigh Valley, Northern Pacific, Southern Pacific and Union Pacific selling on better than 6 per cent basis it is hard to see how the investor can expect much higher yield on these high grade stocks.

The Bond Market.

THE bond market has also suffered in sympathy with the decline in stocks. There has been, however, a fairly good demand for seasoned railroad and public service issues. Among other influences the decline in the prices of certain industrial preferred stocks is expected to send investors back to bond buying. The average price of listed railroad bonds has, however, declined more than three points during the past year. During February alone there was a decline of over a point in the average price of twenty-five bonds listed on the New York Stock Exchange. The new issues which were made during the year show a steady increase in yield to the investor. For example, the New York Central's lines equipment trusts sold this year on a 4.65 basis, while in 1911 the yield was only 4.45.

In this condition of the bond market it is not expected that railroads will make any large offer. They will be compelled to raise their capital either by an appeal to their stockholders or by some form of notes.

Showing of New England Roads.

AN exception to the generally satisfactory condition of the railroads from the standpoint of surplus earnings which, while not showing any marked improvement, are holding their own in the face of many adverse influences, is furnished by the two principal railroads of New England. The Boston and Maine for the last two fiscal years failed to earn the dividends paid by $2,080,000. In the fiscal period ending June 30, it is likely that the company will do no more than earn its fixed charges. Its profit and loss surplus as of June 30 last was $1,812,090. It is officially estimated that the property of this company requires $50,000,000 to be spent upon it before it will be efficient to handle its traffic. The New Haven has already spent $15,000,000 for improvement and $10,000,000 remains to be spent.

The Boston and Maine has outstanding $22,000,000 short term obligations of which $12,000,000 fall due in June and $10,000,000 next February. It is evident that the company's financing in the past has been woefully mismanaged. It was Mr. Mellen's frank statement of the deplorable physical condition of the property when he took

Digitized by Google

charge of it, which was primarily responsible for the decline in the market value of the company's shares. For this condition Mr. Mellen, is, however, in no wise to blame. The present situation is the outcome, first, of some extremely burdensome leases, and second, of the neglect of the physical condition of the property.

It is expected that the New Haven directors will recommend that its stock be placed on a 6 per cent basis. The payment of 8 per cent dividends in the year ending June 30, 1913, indicate a deficit for the year of over $2,000,000. The outlook is at present for a surplus of not to exceed $12,300,000 which is about sufficient to pay the 6 per cent rate. Tariff uncertainty is primarily responsible for the temporary industrial stagnation which is afflicting southern New England and is preventing the earnings of New England railroads from showing a normal increase.

The Situation Outside of New England.

OUTSIDE of New England, railroad earnings are generally favorable. The Western Maryland is continually improving its showing, and by June 1st it is expected that the completion of the improvements which have for some time been in progress, will enable the company to take advantage of the large tonnage over the extensions through its connection with the Pittsburgh and Lake Erie. The Louisville and Nashville's gross and net earnings are showing so marked an improvement that it is expected that the year will show a considerable balance, although the first part of the year was unsatisfactory.

The earnings of the Southern Railway Company are showing a satisfactory improvement. Up to the close of the first week in February gross revenues were $3,580,000 above the corresponding period of last year. For the six months the Southern Railway has more than earned its full year's preferred dividend.

The net operating revenue for the Baltimore and Ohio for January shows an increase of $801,787 over the corresponding period of last year. The predictions are made that the gross earnings of the company will pass the $100,000,000 mark and that the net income will be between 11 and 12 per cent on the common stock.

The Western railroads have also shown marked improvement. The following tables, taken from the *Wall Street Journal*, show, first, the gross earnings for the six months ending December 31, the increase over the first half of the fiscal year, and the percentage of gain, and second, the net earnings for the same period. It should be noted with especial gratification, that these large Western railroads have shown larger proportion of gains in net earnings than in gross.

Western Railway Earnings.

Six months	Gross	Increase	% Inc.
Atchison	$61,228,359	$6,291,575	11.4
St. Paul (old system)	39,004,166	5,659,711	16.9
Great Northern	44,110,727	7,492,651	20.4
Illinois Central	33,413,641	2,920,302	8.9
Northern Pacific	39,721,737	5,241,968	15.2
Northwestern	43,854,869	4,594,811	11.7
Southern Pacific	75,648,105	6,578,730	9.5
Union Pacific	51,580,269	4,535,724	9.6
	Net	Increase	% Inc.
Atchison	$19,011,544	$2,540,760	15.4
St. Paul (old system)	12,340,612	4,418,585	55.7
Great Northern	19,725,455	2,746,294	16.1
Illinois Central	6,000,251	1,487,276	24.7
Northern Pacific	15,620,888	1,945,413	14.2
Northwestern	14,592,191	2,339,835	19.0
Southern Pacific	26,689,664	3,454,848	14.8
Union Pacific	21,864,572	2,502,154	12.9

An interesting showing, in conection with the comparatively moderate return earned by the New York Central on its capital stock last year, is the fact that the undivided earnings of its principal subsidiaries brought the percentage of earnings, behind the stock, up to 10 per cent. The Michigan Central, for example, earned 14.6 per cent on its capital stock and had a surplus for the year of $1,602,000, while the Lake Shore earned 33.1 per cent with the large surplus of $7,584,384. The other subsidiaries also showed substantial gains.

The Erie.

THE Erie Railroad is doing the heaviest business in its history. January gross revenues increased $614,000, or 14.6 per cent over last year. From July 1st to February 14th the gain in gross earnings was $3,485,000, or 9.6 per cent. All branches of traffic, merchandise, coal and passenger, are showing large gains. The open winter has enabled the Erie to continue without interruption the work of constructing and grading 276 miles of second track which will give the company a complete double track line between New York and Chicago. These improvements, it is estimated, will increase the company's carrying capacity 50 per cent.

The Wabash.

THE Wabash is rapidly progressing to a condition of complete solvency. In the first week of March gross revenues were $572,000, an increase of 15.1 per cent over the same week of 1912. February gross earnings show an increase of 13 per cent over last year, and from July 1st to March 7th the gain in gross earnings was 11.6 per cent. If the present increase in earnings continues, the company will show a gain in gross earnings for the full fiscal year of $3,650,000. A large part of these increased revenues is, of course, going into the property.

Pungent Observations on Government Ownership.

C. D. Kellogg, secretary of the American Railroad Employes and Investors Association, calls attention to some pungent observations on Government ownership of railroads recently made by "Cy" Warman, who is well known for his writings on railway matters. The observations referred to are as follows:

"American railways are well managed, deliver the goods cheaper and pay better wages than do the railways of any other country on earth.

"Private railways are a success. Government railways are a failure.

"Private railways kill a few people. Government railways kill a nation.

" 'Push,' on a private car line, may put you in a private car. On a government road it takes 'pull.'

"I believe that in nine cases in every ten, where a country is burdened with a government railway that country would like very much to lose the road.

"The private railway is a great field for bright, ambitious young men. A government road is a haven of rest for nephews and second sons."

Operation

Teaching Railway Signaling in England.

FROM OUR ENGLISH CORRESPONDENT.

A VERY interesting school has been established by the Lancashire and Yorkshire Railway of England for the teaching of railway signaling and some account of its work with illustrations will be interesting to readers of the RAILWAY WORLD. It has been organized to give facilities to members of the staff of this railway to extend their knowledge of railway working; and, with its present equipment, is the finest school of signaling in England.

A model miniature railway is provided with signals and points worked from three signal boxes. Signal box "T" works the points and signals in connection with a terminal station so laid out that all types of operations which require to be carried out at a terminal station can be demonstrated; this signal box is connected by block telegraph circuits to signal box "A." Signal box "A" operates the points and signals in connection with up and down main lines, the inlet to a goods loop running between signal box "A" and signal box "B" and also the points leading into a refuge siding; this signal box is also connected by the block telegraph circuit with signal box "B." Signal box "B" works the outlet from the goods loop and the junction to and from signal boxes "C" and "D" respectively, and is connected by block telegraph circuits with signal boxes "A," "C" and "D."

The model railway as laid out at signal boxes "T," "A" and "B" allows of all kinds of operations under different conditions to be demonstrated.

A track circuit is provided between the up starting signal for "B" and the up home signal for "A" and when a train is upon the track circuited section of the line, the block instrument is locked at the "Train on Line" position, a three-position track indicator in signal box "A" shows the approach of the train and the up starting signal for "B" is locked in the danger position. This arrangement shows how a track circuit can be used for protecting an obstruction between the last stop signal for the signal box in the rear, and the home signal for the signal box in advance.

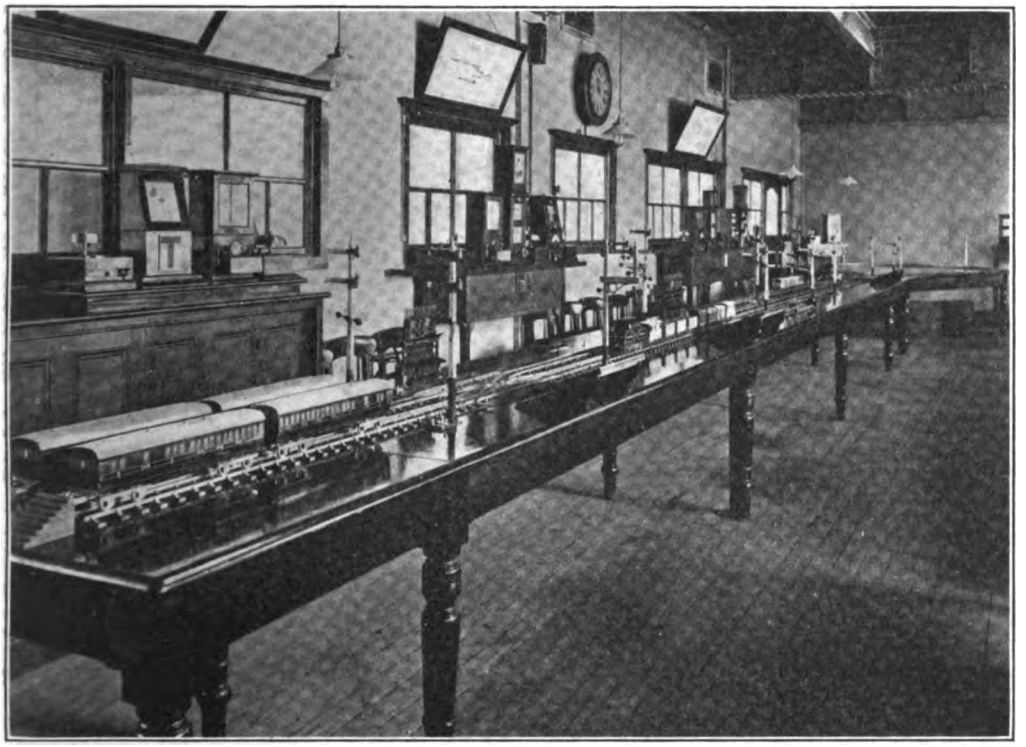
Track circuits are also provided between the fouling points of the junction at "B"; and the starting signal to "C" and the starting signal to "D" operate indicators in the "B" signal box, showing when the line to "C" or "B" respectively is obstructed and also lock the protecting signals. This arrangement shows how track circuits can be used for protecting an obstruction between home signals and starting signals.

At the up home signal from "D" for signal box "B," to and from electric bell communication is established which operates an indicator in the signal box at "B" showing "Train waiting at signal," and demonstrates what is done at places where such appliances are in force in substitution of carrying out the provisions of rule 55 in the book of rules and regulations. This indicator is replaced to the normal position when the home signal is lowered.

Rule 55 is also suspended in connection with

INTERIOR OF SCHOOL OF SIGNALING, LANCASHIRE AND YORKSHIRE RAILWAY, ENGLAND.

Digitized by Google



MINIATURE RAILWAY AND APPLIANCES IN SCHOOL OF SIGNALING, LANCASHIRE AND YORKSHIRE RAILWAY, ENGLAND.

trains detained on the track circuited portion of the line similar to the practice which is in operation on the Lancashire and Yorkshire Railway. At the signals where rule 55 is exempted a plate is fixed to this effect.

Miniature engines of the company's standard electric and steam type are run along the railway, and in order that all types of trains may be dealt with, miniature passenger and goods vehicles are also used. The trains are electrically propelled by the use of a third rail similar to the electric traction system in operation on the company's electrified lines in the Liverpool and Southport districts and are so arranged that by means of keys in connection with separate traction section circuits, a train may be drawn forward or set back, as required, on different parts of the railway.

At each signal post a cut-out switch is also fixed so that students taking up the position of a driver of a train may bring it to a stand at a signal when at danger and restart the train after the signal has been lowered.

One of the company's standard signal box lever frames with the necessary block instruments is fixed in the school and so arranged as to work the points and signals which would be required for a railway laid down as shown in the signal box "B" sketch. This lever frame is extensively used for dealing with all kinds of operations, as by means of the illuminated diagram the passage of the train along the line can be indicated. Illuminations can be placed on each running line to indicate the following positions:

(1) Train passed distant signal.
(2) Train at a stand at home signal.
(3) Train passed signal box.
(4) Train at a stand at starting signal.
(5) Train passed starting signal.

Electric tablet instruments are provided and also patterns of the standard type of signals in use on this company's line together with apparatus showing how the chain communication between passengers and guards and engine drivers is operated.

The questions put down for examination for prizes are calculated to leave the graduated pupil conversant with what he should do under almost any conceivable set of circumstances. The following are questions from recent papers:

Can a signalman at a junction allow a goods train, light engine, or coaching stock train to leave a loop line or siding during the time a goods train, light engine or coaching stock train is approaching?

Where station yard working is in operation and the line on which a train is required to run is already occupied, how should such a train be allowed to enter the section?

May a signalman shunt outside the home signal in all cases if he can obtain the necessary permission from the rear?

If a train breaks down in the section in advance, and before "Train out of section" has been received for it, and if the fireman or guard comes back asking for an assistant engine, or for the break-down vans, what should be done?

If the "cancelling" signal is received from the signal box in rear when the block instru-

STANDARD BOX AND SIGNALS, LANCASHIRE AND YORKSHIRE RAILWAY, ENGLAND.

ment shows "Line clear" or "Train on line," what action should be taken with the block instrument?

If a goods train for which the "Is line clear" signal has been sent forward and acknowledged disposes of its load at a signal box, and only the engine or the engine and one or two break vans goes forward, what is to be done?

If a train is running between a box and the box in advance when the first-named box is switched in, and afterwards "Train out of section" for it is received from the box in advance, what should be done?

The Progress of the Safety Campaign.

IT is apparent that the "safety first" movement is about to become one of the historic events in the annals of railroading. As from month to month we have noted one system after another falling into line with the result that within a space of less than two years this work has been taken up by almost every large railroad system, it seems almost impossible to imagine any additional lines of development. A review of the safety work of the past month, however, shows most important progress and it now appears that the movement bids fair to become international, for the Chicago and North Western Railway has received a request for full information concerning its safety work from the vice-president of the Imperial Government Railways of Japan. A similar request has been made to the Baltimore and Ohio Railroad by the chairman of the Railroad Branch of the Young Men's Christian Association of the Finland State Railways at Helsingfors, Finland.

Scientific organizations are recognizing the value of the work and are preparing to co-operate in it. Among the papers discussed at the meeting of the American Railway Engineering Association, held in Chicago March 18th to 21st, were a number which concern the problem of making railway travel more safe.

The American Museum of Safety is about to inaugurate a six months' educational campaign in the public schools of New York and Brooklyn for the purpose of preventing accidents on railways, street car lines and from vehicular travel.

Mrs. E. H. Harriman has rendered a distinct service to the movement by offering a medal to be known as the "Harriman Railway Medal" which is to be awarded annually by the American Museum of Safety to the railway making the greatest progress in safety and accident prevention during the year. The medal is intended as an incentive to the great railway systems of America to reduce the number of accidents along their lines. The first presentation of the medal is to be made in 1914. The trustees of the American Museum of Safety are charged with the duty of preparing a set of rules outlining the conditions under which the award will be made. The trustees have invited Mr. Julius Kruttschnitt, president of the American Railway Association, to make suggestions concerning this matter. The chairman of the committee having charge of this work is Mr. C. L. Close, general manager of the United States Steel Corporation.

The Mammoth Pittsburgh Rally.

WHAT in all probability is the largest single safety rally thus far held was the gathering in the Exposition Hall at Pittsburg, on March 10th, at which about 12,000 people were present. This notable audience was made up of the employes and their families from every railroad system entering that city, and from some of the larger industrial establishments which have undertaken such work. The exercises consisted

Digitized by Google

of moving pictures and stereopticon views of a fitting character and of talks by a number of railway and industrial men. One of the speakers effectively summed up the purpose of the meeting when he stated that "it was designed to cause more weddings, fewer funerals, more flowers for the bride and fewer sadnesses over accidents which might have been avoided." One speaker urged the men to lay as much emphasis in their union lodges upon the matter of safety as they did upon the matter of wages or hours of service. He advocated that a careless man should be brought before the lodge and given to understand that such a course of action was a serious offense.

Many other safety rallies have been held throughout the country during the month; a number of these have been notable not only from the standpoint of the size of the gathering but from the quality of th aeddresses made. It is obviously impossible to even briefly chronicle these gatherings. Railway officials, however, realize that while monster meetings are impressive and produce much good, the real basis of the "safety first" movement lies in the universality of the campaign so that it reaches every worker no matter how remote he may be situated.

Fitting Up "Safety" School Cars.

TO this end several railroad systems have, at large expense, fitted up school cars which can be sent to every point on the system for the prosecution of safety work. The Burlington, for example, has fitted out a car with stereopticon and other facilities for showing pictures, and with seats arranged for the auditors. This car is being sent to the shops, freight yards and stations along the system.

The Chicago and North Western Railway has appointed C. G. Stecker as signal instructor with orders to instruct enginemen, trainmen and other employes in the use of signals and signal indications. A car has been fitted out for the purpose of carrying on this work which contains not only stereopticon and moving picture machines but carries charts and other exhibits to visualize the signal instruction.

Frisco System to Enlist Children in Safety Fight.

THE Frisco System has prepared a circular which is to be sent to the school principals in every important town in its territory, with the request that they read the statement to their pupils and post it, if possible, in a conspicuous place. It is suggested that an excellent topic for school essays is the "safety first" movement or some of its phases, such as the dangers of trespassing on railroad property; the folly of walking on the track, playing in the yards, or "hopping" moving trains. The circuar contains the striking statement "that in the years 1901-10, inclusive, 103,452 trespassers were killed or injured on the railroads of the United States. Of this number 15,000 were under the age of 14 and 20,000 were between 14 and 21 years of age. The Frisco System, in addition, is endeavoring to secure the co-operation of the local authorities in the towns in its territory in keeping the children away from its property.

Lehigh Valley Safety Work a Success.

THE officials of the Lehigh Valley in charge of the safety campaign are very much encouraged with the progress of the work. The results thus far secured are even more satisfactory than was anticipated. This company has offered a "safety banner" which is to be awarded to the division having the best safety record for the year.

Necessity for Greater Care in Employing Men.

MR. GEO. BRADSHAW, general safety agent of the New York Central Lines, in an address before the Western Railway Club, declared that "more care should be taken in determining the mental and moral qualifications of men employed in responsible positions. There should be an employment bureau on every large railroad having authority to employ men and to make a thorough investigation of the history of each applicant. We should have the finest body of men in the world in charge of our trains. Every boy wants to go railroading and we should select the best of them for the service."

The Necessity for Safety Campaigns to Protect Our Streets.

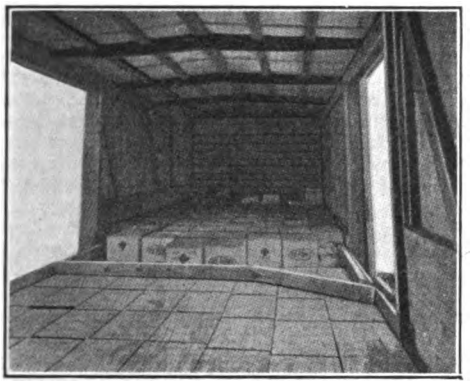
PERHAPS the only serious objection which can be raised to the "safety first" movement is the impression which it has created in the minds of many poorly informed people that it is more dangerous to ride on the railroad than to travel in any other manner. That such is not the case is something which is easily demonstrated. In the year 1912 in which the railways hauled, 1,000,000,000 passengers a total of 35,000,000,000 miles, the number of passengers killed was only 139, while the number of persons killed by automobiles in New York City alone was 146. The number of people killed last year by automobiles in Chicago was 38 per cent of the total number killed on all of the railroads during the same period.

Report on Safe Transportation of Explosives.

THE chief inspector of the "Bureau for the Safe Transportation of Explosives and Other Dangerous Articles," has submitted his report on the work of the Bureau for the calendar year 1912. The report shows that the number of boxes of high explosives and kegs of black powder condemned as unsafe for transportation, has materially decreased for the year under review. As compared with 10,902 boxes of high explosives, which were condemned as unsafe in 1910, and 6,591 in 1911, only 4,798 were so condemned in the year 1912. The number of kegs of black powder so condemned decreased in the three years from 1,291 to 1,205, and 399 respectively.

During the year, the Bureau gave 668 lectures to employes and railway officials, made 14,609 inspections, and enrolled sixty-two new member-companies, operating 13,540 miles of road. An interesting feature of the report are the illustrations which accompany it, some of which are herewith reproduced, showing common errors in loading, made by shippers, which indirectly lead to explosions. Attention is called to the fact that a very considerable proportion of the accidents is

Digitized by Google



Interior of box car showing a broken box of dynamite in a carload consisting of 460-fifty pound boxes, total weight 23,000 pounds. The damage to the box of explosives was due primarily to faulty loading, although the car must have been subjected to extraordinary rough treatment, as the entire load had shifted twenty inches from the further end of the car.

due to rough handling of cars containing explosives by railway employes. This is in part due to the fact that employes fail to appreciate that many freight cars stand treatment without apparent injury, that is disastrous to the packages of freight in the car. The report recommends that railway officials should impress upon their men the fact that where a car of ordinary size is colliding at a speed of five miles per hour, with a string of loaded cars, the end box of dynamite or other high explosive is subjected to a pressure of over 7,300 pounds, which is likely to break open the package, either causing an explosion at that time, or later, through friction, shock or spark with the exposed contents. It is recommended that dangerous explosives be given the preference over non-perishable freight in train and car movement. The major portion of the report consists of a digest of the facts and causes of the various railway explosions investigated by the Bureau during the year.

Co-operation of Officials and Employes.

AN encouraging sign of the times is the rapid extension of co-operative efforts between railways officials and their employes. Vice-President Horn, of the Boston and Maine Railroad, has inaugurated a series of conferences with the various classes of employes under his jurisdiction. The first meeting was made up of the passenger and freight conductors. Mr. Horn discussed the history of railroad rules and the public attitude toward the railroad. He explained the recent decline in the market quotations of the stock of his company on the ground that the public did not look with as much favor upon railroad stocks as formerly because of the many hostile attacks to which the railroads had been subjected: the decline was in no way the result of the New Haven's control.

Railway officials are following with much interest the policy recently inaugurated by the New York Railways Company, which operates a considerable proportion of the surface railways in New York City, of establishing co-operative stores for its employes. Every article offered is quoted at considerably less than prevailing prices—prices in fact are fixed at the actual wholesale cost plus the expenses of operation. The company is prepared to make up any deficit which may occur, believing that such an expenditure would be amply justified by the effect of the co-operative stores upon the employes.

Pennsylvania's Employes to Give Information Concerning Delays, Accidents, etc.

INSTRUCTIONS have been given to conductors and station agents by the Pennsylvania Railroad Company requiring them to give prompt information to passengers of the causes of delay in traffic and if necessary the best means of proceeding on their journey. Notices are to be posted on bulletin boards by station agents stating the location of the obstruction to traffic, the probable length of delay and any other information as to the cause and extent of the difficulty. When a train is disabled at or near a station passengers who desire to communicate with their friends from the station are to be afforded promptly the use of the telephone or telegraph.

This wreck shows what can be expected when high explosives are subject to rough treatment. In this instance, occurring some years ago, the engine came in contact with about 2,800 pounds of dynamite and an explosion immediately occurred with the results as shown.

Economies in Coal Consumption on Lehigh Valley.

THE Lehigh Valley Railroad Company is carrying on an energetic campaign to further reduce the consumption of coal on its locomotives. In addition to the road foreman of engines, who has general supervision of this work, expert firemen are assigned to train new men in the methods of economizing in the use of fuel. Accurate records of coal consumption of each locomotive are kept and wherever excessive use is discovered, corrective measures are applied. It is impressed upon the men that with the exception of wages, fuel constitutes the largest single item in the cost of operation; that the company consumes 150 carloads of coal a day requiring an expenditure of about $10,000, and that the saving of .10 per cent in the fuel would mean $1,000 a day.

In spite of the fact that the company is running larger and heavier trains than a year ago, and that many new firemen were employed in the latter months of 1912, the consumption of coal per ton mile has shown a net decrease of 5 per cent, as compared with the same period of the previous year.

Magnificent New Trains in the West.

ONE of the most notable developments of the month has been the announcement by several of the transcontinental systems of new limited trains running on fast schedules. The Union Pacific has announced that the "Overland Limited," on and after April 10th, will leave Chicago at 7 P. M. and arrive at San Francisco at 9.30 A. M. on the third day thereafter instead of 2.10 P. M. as at present. This will amount, in effect to the saving of a business day. In the opposite direction the train will leave San Francisco at 2 P. M., arriving at Chicago at 9 A. M. on the third day. An extra fare of $10 will be charged. All steel equipment will be used throughout, the new cars being fitted with every modern convenience, including barber shop and bath. No day coaches will be carried in this train. In addition, a new train will be placed in service, in connection with the St. Paul, to be known as the "Pacific Limited." It will leave Chicago at 10.45 A. M., arriving at San Francisco at 9.30 A. M. and at Los Angeles at 10 A. M., the third morning. In the opposite direction the train will leave San Francisco at 10.20 A. M., arriving at Chicago at 8 A. M. on the third morning.

North Western Establishes New Limited Train.

ON April 1st, the Chicago and North Western Railroad will begin the operation of a new 64-hour and 30-minute train between Chicago and San Francisco. The train will leave San Francisco at 2 P. M., arriving at Chicago at 9 A. M. on the third morning. The Chicago train will leave at 7 P. M., arriving at San Francisco at 9.30 A. M. the third morning. No day coaches will be carried.

St. Paul Eliminates Extra Fare on 72-Hour Train.

EFFECTIVE April 1st, the Chicago, Milwaukee and St. Paul Railroad will discontinue the extra fare heretofore charged on its 72-hour train from Chicago to San Francisco and Los Angeles. It is believed that this will greatly stimulate travel between Chicago and the Pacific Coast over this route.

Frisco Secures New Orleans Terminal.

ANNOUNCEMENT was made on March 14 that an agreement had been reached between the St. Louis and San Francisco and the Illinois Central by which the former will use the tracks of the Yazoo and Mississippi Valley between New Orleans and Baton Rouge. This action was forecasted in the last issue of the RAILWAY WORLD. It followed the decision of the courts that the contract between the Frisco and the Louisiana Railroad and Navigation Line, by which the former had secured a New Orleans terminus, was null and void. It is understood that the new arrangement is for a term of ninety-nine years.

New York Central Proposes to Absorb Lines.

THE New York Central and Hudson River Railroad Company has made application to the Public Service Commission, Second District of New York for permission to absorb the Rome, Watertown and Ogdensburg Railroad Company and its subsidiaries. The New York Central now holds a lease on the Watertown railroad for its corporate existence and owns 80,188 shares of the total issue of 100,000 shares. One of the problems which must be adjusted in connection with the proposed consolidation arises out of the fact that a number of the towns in the northern part of the State, tributary to this road, issued bonds for the purpose of financing its construction. It is problematical what position these municipalities will take upon the proposed consolidation.

New Haven Establishes Fine Train.

ON February 25th, the New York, New Haven and Hartford put into service one of the most magnificent trains in operation in the country. This train which is known as the "Merchants Limited," runs between New York and Boston, leaving Grand Central Terminal at 5 P. M. The train, which is composed of all steel equipment consists of parlor, smoking, dining and observation cars, which have just been delivered by the Pullman Company. The upholstery is of tapestry, the lighting system is indirect electric, and the seats and ventilation are of the most approved type. State rooms have been eliminated, giving 36 seats instead of 28 in the parlor cars, the observation smoker is finished in cocoa wood and has 40 leather chairs, and a buffet and electric stove.

New Haven Directors Authorize Lease.

THE Board of Directors of the New York, New Haven and Hartford Railroad Company have authorized President Mellen to negotiate a lease of the lines of the Northampton division, north of Westfield, Mass, to the Boston and Albany Railroad. The details of the proposed lease have not been worked out, but if it is possible to make a satisfactory arrangement the Boston and Albany will thereby secure entrance into Holyoke, Eastampton, Northampton, Turners Falls and Shelbourne Falls. The Board of Directors of the New Haven also authorized President Mellen to negotiate a lease of the trolley lines connecting New London and East Thompson, Conn., now owned by the Connecticut Company to the Shore Line Electric Railway Company. The terms and conditions of this lease are subjects for future negotiations.

Cause of Heavy Loss in Damage Claims.

THE investigation which has been conducted by the Chicago and North Western during the last year as to the reason for the large loss and damage claims annually paid by the railroad with respect to freight shipments, brings out some interesting facts. While less than carload freight tonnage comprised only 5.7 per cent of the total tonnage and developed 21.5 per cent of the aggregate revenue, the loss and damage claims paid, arising from this class of freight, represented 53.7 per cent of the total claims of this character. The reasons ascribed for this condition are that less than carload freight is as a rule higher in value and in addition is more subject to careless handling en route. Steps are being devised to decrease the loss through the mishandling of such freight by employes.

Digitized by Google

Railroads Installing Sanitary Drinking Cups.

PRACTICALLY all of the railroads in the country are preparing to comply with the Interstate Commerce Commission's recent ruling prohibiting common drinking cups on interstate trains. The Pennsylvania, the Reading, Baltimore and Ohio and other systems are putting in devices to furnish individual paper drinking cups on all trains, while a number of roads are placing spouting fountains in the stations. In many cases the old common drinking cups are being abolished on local trains which are technically not subject to the Interstate Commerce Commission.

Efficiency of Car Operation.

ACCORDING to the compilation of the American Railway Association, the average mile traveled per day of freight cars on the railroads of the United States and Canada reached a high water mark for the month of November last. The average distance each car was moved during that month was 26 miles, compared with 24.4 miles in November, 1911. The month is unusual, moreover, in that it does not show the usual decline in efficiency over the showing for the month of October, which almost invariably occurs.

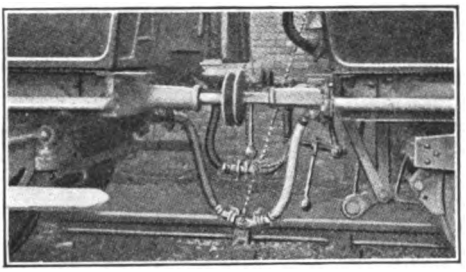
Unusual Operating Conditions During the Past Winter.

IT is unlikely that the present generation of railway officials will ever witness such a sharp contrast in operating conditions as has prevailed this winter and last winter. The winter of 1911-12 was one of the most severe that has ever been experienced, the weather being not only unusually cold but the difficulties of operation from snow being long continued and widespread. On the other hand the winter just closed has been unusually mild. With the exception of the last week of February there has been no severe weather this winter throughout the West, although a number of storms have occurred in the Southwest and Pacific Northwest which have made trouble for brief periods. The notably open winter has saved the transcontinental lines in the Northwest on the average $1,000,000 each in operating expenses, while the mild weather has brought about a beginning of the spring track work on the Western roads about a month earlier than is usual.

Cutting Trains When Running at High Speed.

AMERICAN operating officials are interested in the practice recently inaugurated upon the Great Western Railway of England, of cutting a train in two when running at high speed, allowing the rear portion to stop at some designated point. This practice was instituted in order to avoid making a stop at Exeter by the "American Mail" and other fast trains, and its operation is interestingly described in the *Railway Man's Magazine*. Through the use of this device, it is now possible for the company to run this train from London to Plymouth—a distance of over 225 miles, without a stop—in 245 minutes. One or two cars, or as many as may be needed, are cut off the train, while running at full speed, at Plymouth, or such other points as occasion may require.

The inauguration of the practice of cutting a high-speed train in two, while running, was viewed with disfavor at first by the British Board of



(Courtesy of the Railway Men's Magazine.)

A VIEW OF THE "SLIPPING" APPARATUS EMPLOYED ON THE GREAT WESTERN RAILWAY OF ENGLAND.

Trade, but experience has apparently demonstrated that this can be safely done. The method by which this is accomplished is shown in the accompanying illustrations. It will be observed that the couplings between the cars contain what is referred to as the "slipping" apparatus, which, in reality, is but little different from the ordinary coupling device in the passenger service in this country. In conjunction with this slipping apparatus, however, there is installed a system of levers in the car, by which it is possible for the brakeman to slip the coupling whenever desired. When the train approaches the point where one or more cars need to be cut off the engineer is instructed to look to the rear of his train. The brakeman at the same time waves a green flag, which indicates that he is ready to cut off the required number of cars. When the engineer receives this signal, he shuts off steam. This causes the buffers to close up, as the rear cars of the train push slightly against the fore part in the manner well known to all operating officials. When this occurs, the brakeman, after shutting off the valve in the air-line, drops his lever, disconnecting the coupling and dividing the train. The engineer puts on steam and resumes speed, while the brakeman brings the cut-off rear portion to a gradual stop in the station.

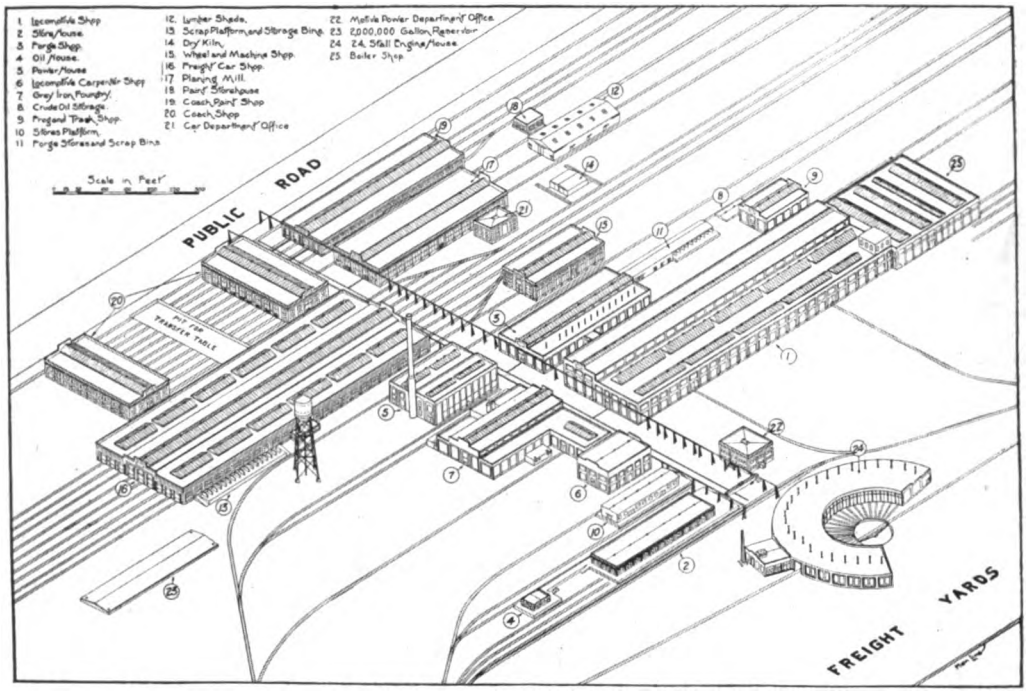
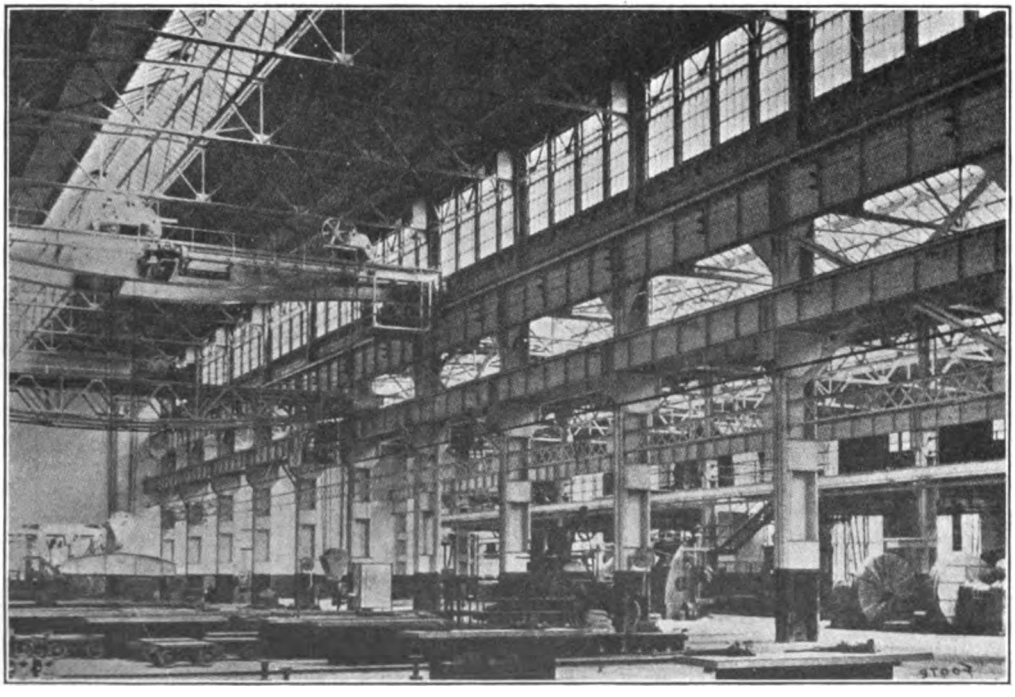
The New Railway Shops at Transcona, Manitoba.

BRIEF reference was made in the March issue of the RAILWAY WORLD to the completion and successful opening of the Grand Trunk's new railway shops at Transcona. Through the courtesy of *Canadian Machinery*, we are now able to present several illustrations which will

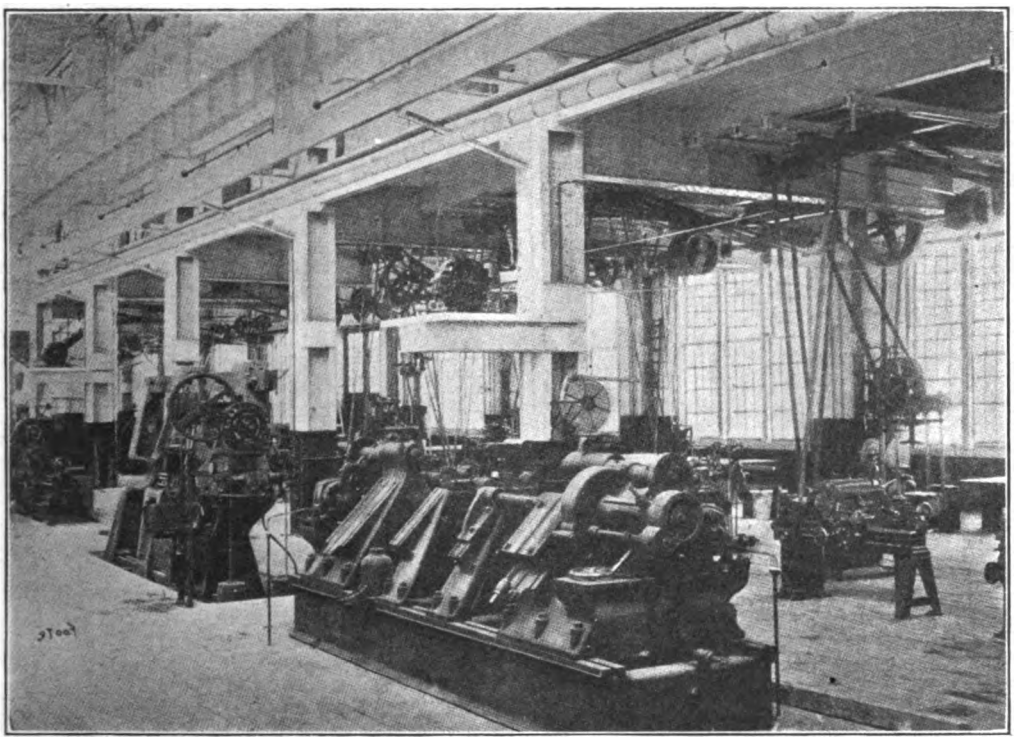


LAY-OUT OF EXTENSIVE RAILWAY SHOPS RECENTLY COMPLETED AT TRANSCONA, CANADA.



UPPER END OF LOCOMOTIVE ERECTING SHOP SHOWING 120 TON CRANE AND ONE TEN TON MESSENGER CRANE.

Digitized by Google



VIEW IN MACHINE SHOP.

give our readers a clearer idea of the remarkable work which has been accomplished in the building of these shops which represent, both as to size and completeness, one of the finest aggregations of buildings of their kind on the North American continent. It has taken about four years to complete the work, and the buildings cover an area of somewhat more than seventeen acres.

All buildings have self-supported steel frames standing on re-enforced concrete footings. The walls are of concrete up to the window sills and rest on wide concrete footings. Above the window sills, the walls are of white brick, carried up into a parapet wall on all four sides of the building, and topped with a coating of concrete. The lay-out of the buildings as shown in the illustration, is of particular interest to railway officials and indicates how carefully planned, along scientific lines, has been their individual and collective locations. All departments are connected by telephone, and ample fire protection is afforded by two one thousand gallon Underwriter fire pumps in the power house, from whence a complete system of piping is distributed throughout the plant. It will also be noticed that the grouping of the shops has been arranged as compactly as possible in order to facilitate intercommunication in winter. Space does not permit a description or study of the marvelous equipment of tools, machines, cranes, etc., which have been installed, but it is of interest to note that the United States is responsible for about 40 per cent of the machine installation, Canada 37 per cent and Great Britain 23 per cent.

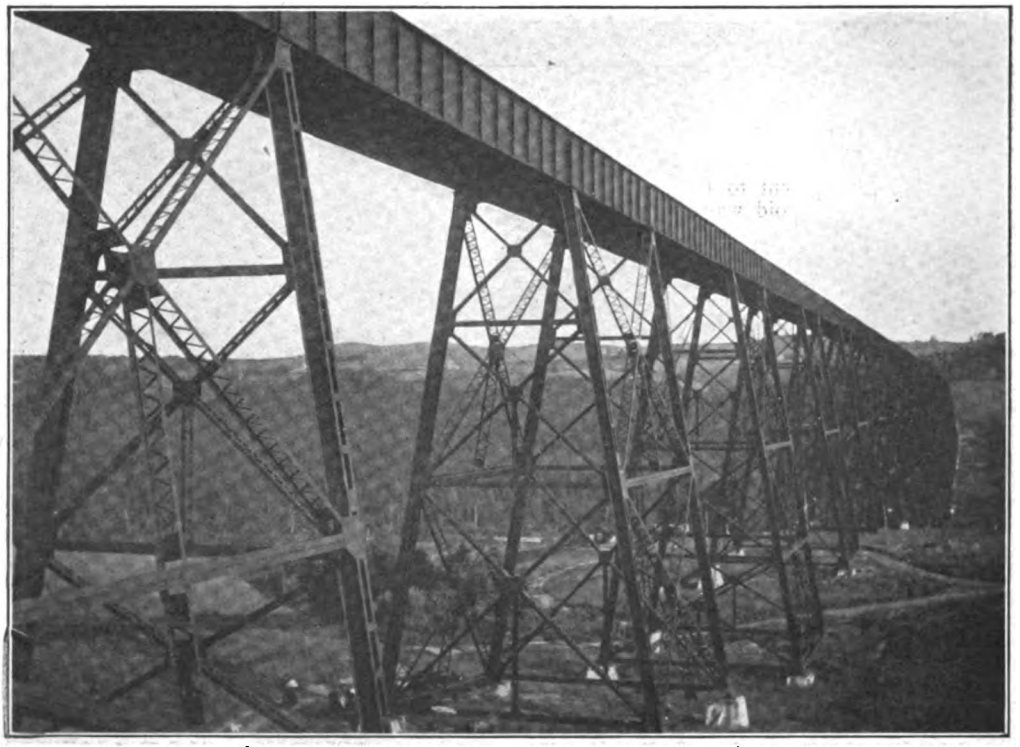
Both the National Transcontinental Railway Commission and the Grand Trunk Pacific are to be heaartily congratulated upon the completion and successful opening of these magnificent shops. They represent the latest and best ideas in shop construction and methods and will undoubtedly play an important part in maintaining an efficient transportation plant for that great part of the Canadian Northwest whose future prosperity is vitally dependent upon a progressive railway policy.

THE LITTLE SALMON RIVER VIADUCT OF CANADA

IN building the Little Salmon River viaduct on its line between Moncton and Edmunston, the National Transcontinental Railway of Canada has completed a task of more than ordinary proportions. The valley of The Little Salmon River at the point at which the viaduct is built, 185 miles from Moncton, shows a crossing over 4.000 feet long with a height of 200 feet above the water line.

In many ways the bridge is a remarkable structure. The line approaches the east end with six degree curve through a rock cutting and crosses on a tangent, the grade falling 0.40 feet per hundred. The viaduct consists of twenty-four towers 58 feet 9 inches centers and twenty-five intermediate spans 100 feet 3 inches center to center, the end spans being 100 feet 10½ inches center of bent to outer end of steel. All the tower spans

Digitized by Google



THE LITTLE SALMON RIVER VIADUCT BUILT BY THE NATIONAL TRANSCONTINENTAL RAILWAY OF CANADA.

are alike and also the intermediate spans, except that the masonry ends are extended to give the required bearing.

The towers and bracing are made alike as much as possible, necessitating one set of templates only for the spans and parts of towers which duplicate each other. A through girder system of construction was adopted, the girders being spaced 17 feet 6 inches center to center while the floor beams with gussets were spaced 14 feet center to center along the plate girders. The east end span is on a spiral to a six-degree curve and in consequence the girders are deflected at this abutment 1 foot 3 inches off the tangent to the structure produced.

METHOD OF RAISING AND MOVING RIVETING GALLERIES.

The approach at the end of the bridge is through a rock cutting, and, in order to avoid building the steel work on a curve, and also to utilize the material in the cutting without waste, an abutment of reinforced concrete placed on top of the rock fill, was decided on. A buried pier built from the original surface at this point would have been over 100 feet high, difficult to design and build, and very costly. This was avoided by the use of a bank abutment. The concrete was reinforced to prevent danger of cracks from settlement in the bank, and in order to give time for the bank to settle, the ends of the girders were temporarily supported by a crib work of square timber, before building the permanent abutment.

In the design of the pedestals and west abutment, borings and test pits were first made to determine the character of the soil. This proved to be of compact sand, gravel and hard pan, so that no piling was required, the footings being designed to distribute the load at a pressure of from 2.5 to 4 tons per square foot. The four pedestals near the water line at the banks of the river were built with curved cutwaters, the axis of piers being parallel to the direction of the current, forming suitable icebreakers. The anchor bolts for pedestals consisted of two rods, two inches in diameter, the lengths varying according to the up-lift to be resisted. These rods were anchored at the bottom by spacers of 10-inch channels and washes, the concrete being built around them.

In order to give room for a little variation in

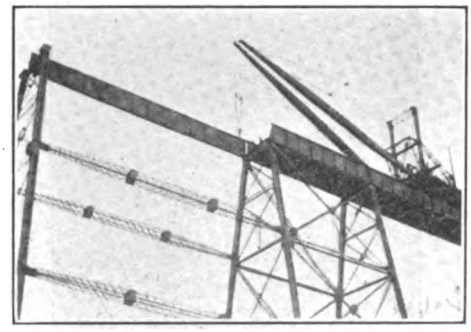
Digitized by Google

their position, conical forms were set around each bolt, a lip being left at the top extending beyond the base plate of column through which these voids were filled with grout after the steel was erected. The west abutment or buried pier was about 40 feet in height above the footing course, and in order to reduce the pressure on the soil and allow the embankment to run through and surround it, an arched void was left in a longitudinal direction.

The main feature of the erection outfit was the 30-ton two-boom erection derrick, traveling on the top of flanges of the girders, the trucks of the traveler running on 115 pounds of crane rail, the base of which rested on timber temporarily secured to the girder flanges.

This derrick was self-propelling by means of a chain and sprocket connecting the trucks with the erecting engine. After a tower and its girders were assembled the erection struts were removed and used again to stiffen the first bent of the next tower until it too was connected and self-sustaining. The hook bolts temporarily connecting the ends of the three struts with the columns proved very efficient.

One of the important features was the use of riveting bridges for the convenience and safety of the men in assembling, riveting and painting. They were carried along the top of the trestle by the two boom yard derrick car, and after being secured to the top flanges of girder by hooks,



PLACING A HUNDRED FOOT GIRDER.

the cages were lowered or raised by hand, as required, the free end of the tackles being on the platform so that the riveters could slack away themselves.

It is stated that the riveting gangs averaged 302 rivets per day of ten hours per gang, a rate which would probably have been reduced by 50 per cent if ordinary staging had been used, instead of the riveting cages. A pair of 100-foot girders were swung and bolted in their final position in 37 minutes, and floor beams and stringers assembled in half a day.

HOPPER BOTTOM GRAIN CAR

MR. J. COLEMAN, Superintendent Car Department, on the Grand Trunk Railway System, whose device for holding the bodies and trucks of cars together so as to prevent telescoping in case of accident is described elsewhere, also has to his credit the invention of the only successful hopper bottom grain car upon the American continent.

Hopper bottom cars which unload coal almost instantaneously have been in use for some time but the problem of devising a practical door which would prevent grain from escaping has hitherto baffled solution.

The "Coleman" steel hopper bottom box car No. 9950 has been in service for trial on the Grand Trunk between Midland and Portland during the past twelve months and the results have so far been eminently satisfactory. The

NEW HOPPER BOTTOM GRAIN CAR SUCCESSFULLY EMPLOYED FOR THE PAST YEAR ON THE GRAND TRUNK RAILWAY.

Digitized by Google

INTERIOR OF GRAIN HOPPER CAR.

car has a perfectly level and tight bottom and is in every way the same as an ordinary box car except that it completely dumps grain, coal or any similar produce in a few seconds. It is used eastbound with grain and west bound in return movement with coal and the loading with coal does not appear to unfit the car in any way for grain service.

In August, 1911, the United States Government issued three patents covering this car and three similar patents have been issued in Canada. The following table gives the interesting comparison between the Coleman patent grain car and a Standard grain car:

Particulars	Coleman Car	Standard Car
Carrying capacity	1.833 bus.	1.100 bus.
Tare	48.000 lbs.	37.000 lbs.
Load	110.000 lbs.	66.000 lbs.
Total Load	158.000 lbs.	103.000 lbs.
Carrying capacity in tons to one ton of tare weight	2.29 tons	1.73 tons
Ton miles—Tare	16.728 "	12.894 "
Ton miles—Load	38.335 "	23.001 "
Ton miles—Total	55.063 "	35.895 "

Rate per bushel for 697 miles—Coleman Car, 5 cents; Standard Car, 5 cents.

Rate per ton of grain for 697 miles—Coleman Car, $1.66½; Standard Car, $1.66½.

Rate per ton, mile, load, for 697 miles—Coleman Car, 239 Mills; Standard Car 239 Mills.

Rate per ton mile, load and tare, 697 miles—Coleman Car, 166 Mills; Standard Car, 153 Mills.

Earnings on car of grain, 697 miles—Coleman Car, $91.65; Standard Car, $55.00.

Earnings on car of coal, 149 miles—Coleman Car, $54.02.

Total earnings on grain and coal—Coleman Car, $145.67; Standard Car $55.00.

Earnings on train of 1,200 tons, including grain and tare, 697 miles—Coleman Car, $1,388.42; Standard Car, $1,281.36.

Earnings on seven trips, 400 miles; five trips, 697 miles; two trips, 149 miles—Coleman Car, $1,207.84; Standard Car, $660.00.

Cost of carrying of grain, 697 miles at the rate of two Mills per ton mile-load, although the average for all classes of weight is four Mills—Coleman Car, $76.67; Standard Car, $46.00.

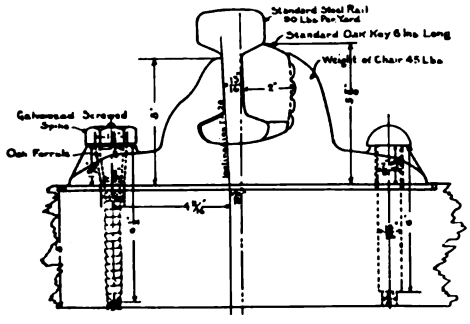
Cost of carrying of coal, 149 miles at three Mills per ton mile load, although the average for all classes of freight is four Mills—Coleman Car, $24.67.

Total cost of carrying car of grain 697 miles, and car of coal 149 miles—Coleman Car, $101.-34; Standard Car, $46.00.

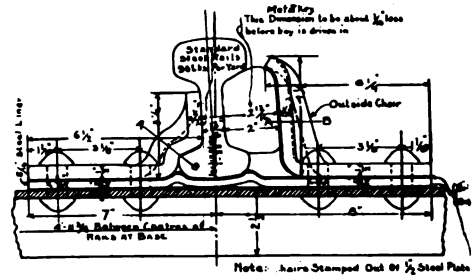
MEMORANDUM CONCERNING THE USE OF ENGLISH TRACK ON THE PENNSYLVANIA RAILROAD

IN the current bulletin of the American Railway and Engineering Association occurs the first publication of the experience of the Pennsylvania Railroad in the experimental use of track installed in a manner similar to that used in Great Britain. It is in the form of an article by Mr. Joseph T. Richards, chief engineer of maintenance of way.

In England the rails are not attached to cross-



STANDARD RAIL, CAST IRON CHAIR AND WOODEN SLEEPER.



STANDARD RAIL, STEEL SLEEPER AND CHAIRS.

ties by spikes as they are in this country. Instead, there is a metal shoe enclosing the rail, rigidity being secured by two wooden blocks hammered between the shoe and the rail.

Mr. Richards makes a careful and detailed analysis of the experience of the Pennsylvania Railroad with the English rail, and then sums up the case as follows:

"In the middle eighties, Mr. Frank Thomson, then second vice-president of the Pennsylvania Railroad Company, while abroad became interested

Digitized by Google

in the question of the comparative merits of English and American track.

"He accordingly authorized the purchase of two miles of London and North Western Railroad standard track for a trial in comparison with American standard track under American conditions.

'In order to give the track a fair trial it was distributed among the four main line divisions (one-half mile to each), so that it would have different roadbed, different climate, and different men to care for it, watch and record its performance and make the final decision, which was thought to be the most impartial way of making the test of this track as compared with ours. The New York division has a sandy, well-drained roadbed, the Philadelphia division runs through a loamy, rich farming section, while the Middle and Pittsburgh divisions are in mountainous and rocky country.

"There was also a discussion at that time as to the comparative merits of track laid with metal and wooden crossties. For this reason, in one-half of the two miles, metal ties were used and wooden ties in the other half. Also, metal keys were used with the metal ties and white oak keys on the sections laid with wooden ties.

"The trial was made on first class roadbed with stone ballast, with the result, as shown in the report, that the English track did not last as long as the American type (the former having an average life of five years and the latter ten or more years), that the metal ties were not as satisfactory for holding the track in line and the metal wedges failed and had to be replaced with wooden ones and the metal ties did not last as long as the wooden; also, that the metal in the English rail did not last as long as the metal in the American rail.

"The cost was about twice as much (both first cost and cost of maintenance) as that of Pennsylvania Railroad standard track.

"These English rails are carried in chairs and held in place by a wooden key, six inches long, driven between the rail and the chair. The connection between the metal crosstie and the chair is riveted. In the wooden tie it is made by lag screws and drive-bolts—all as shown on plans herewith.

"The crossties of both kinds are nine feet long, those of wood being ten inches wide by five inches thick. In this instance the Pennsylvania Railroad standard white oak crosstie, 8½ feet long, of selected width, was used. In both types ten ties are laid to every thirty feet.

"Being $200.96 per year per one-half mile, or about $402 per mile per year for the English, and $103.48 per year per one-half mile, or about $206.96 per mile per year for the American rail.

"The experience with the English type of track on the Pennsylvania Railroad was unsatisfactory and so much so as to be almost annoying.

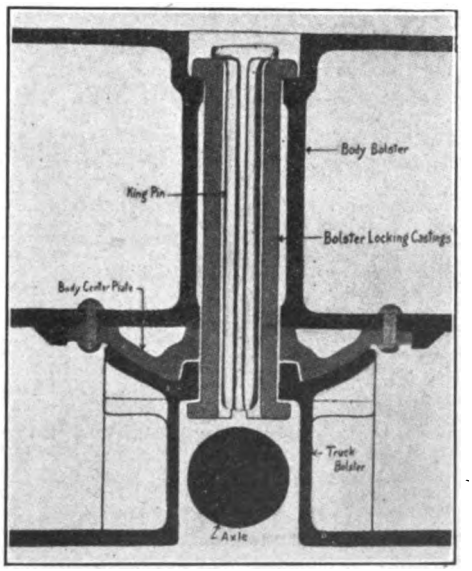
"The difficulties encountered were the same on all divisions—the trouble in keeping track to true line and surface; creeping of the rails; loosening of the wedges; wide gauge on account of wearing of rails, particularly on curves; and the constant care and expense incidental thereto. The rails, however, were shown to be of good material."

CAR BODY LOCKING DEVICE

At a recent meeting of the Western Railway Club, Mr. J. L. Hodgson, of the Grand Trunk Railway, gave a description of a device recently adopted by his company for the purpose of holding the car bodies to the truck and thus lessen the chance of telescoping in wrecks or collisions. The device is simple in construction, consisting of two steel keys passing through the center of the body and truck bolsters which is accomplished by increasing the area of hole in t center plate and bolsters and inserting the two perpendicular keys referred to which have flanges top and bottom for locking over the top of body bolster and under bottom of truck bolster. These keys are separated or spread apart by the insertion of practically the ordinary king pin.

By this simple means, Mr. Hodgson claims that the Grand Trunk is able to largely overcome what is now considered one of the greatest dangers in the operation of trains. It is asserted that the locking device will not interfere in any way with the present flexible movement of the trucks, provision having been made to provide sufficient clearance without interference; and, furthermore, it can be applied to any passenger car. The two flange keys inserted in the hole, when spread apart, lock over the top of body bolster and under truck bolster before the king pin can be inserted, and when the king pin has been dropped between the two expanded keys the recess or opening between these keys is taken up with rib on the king pin, thus making the king pin and the two keys virtually one king pin, locking the body of the car and the trucks with the two flanges on the vertical keys.

A further special reason for the employment



DEVICE ADOPTED BY THE GRAND TRUNK RAILWAY FOR HOLDING CAR BODIES TO TRUCK.

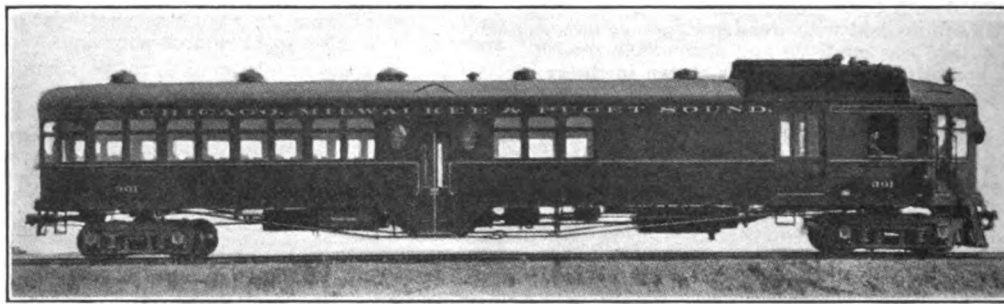
Digitized by Google

of the device is that in lowering the body of the car on the trucks, after repairs have been made, it is impossible for the car repairer or the ordinary laboring man to make any mistake in the locking of the car body to the trucks, for the reason that by putting the keys through the opening of the bolster and center plate, they must lock top and bottom before the king bolt can be admitted, which, in turn spreads the keys over top and bottom flanges.

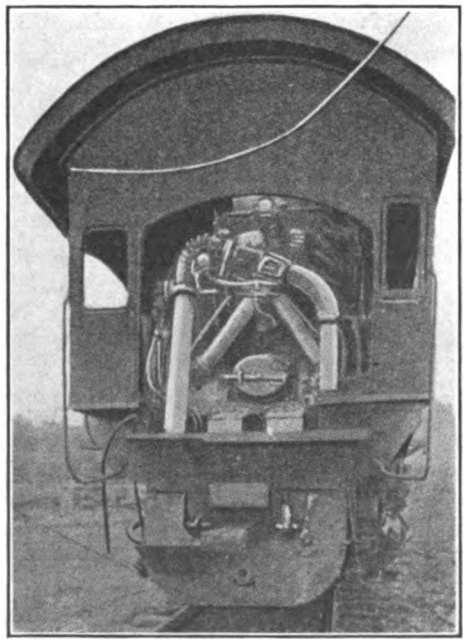
The device, which is shown in the accompanying illustration, is being applied on a large number of new passenger cars for the Grand Trunk Pacific and Grand Trunk Railways and will be standard on all passenger equipment for both roads.

ST. PAUL RECEIVES NEW GAS-ELECTRIC MOTOR CARS

THE Chicago, Milwaukee and Puget Sound Railroad Company, which is the Western subsidiary of the St. Paul system, owning the transcontinental line to the Pacific Coast, has recently placed in service, on its branch lines, two General Electric gas-electric motor cars. These cars, the general appearance of which is shown in the accompanying illustration, are of the combination passenger, smoking and baggage compartment type, with turtle-back roof. They are approximately 70 feet long, have a seating capacity of seventy-seven people, and weigh fifty tons. The power generating equipment consists of an eight-cylinder, four-cycle gas engine, of the "V" type, direct connected to a 600-volt commutating-pole electric generator, specially designed to meet the requirements of the service conditions encountered. The engine is started through a storage reservoir filled by an air compressor direct driven from the crank shaft to the engine. The car is propelled by two General Electric 600-volt, 100 horsepower motors. These cars were sent, under their own power, from the shops of the manufacturing company to the headquarters of the purchasing road. On the trip, one of the cars negotiated 103 miles in two hours and ten minutes. In another case, twenty miles of 2.2 per cent grade was negotiated in fifty-six minutes, with one stop.



GAS-ELECTRIC MOTOR CAR FOR BRANCH LINE SERVICE ON THE CHICAGO, MILWAUKEE AND PUGET SOUND RAILROAD.



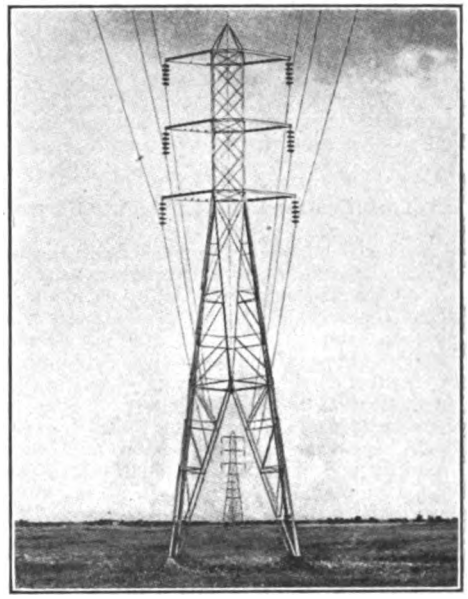
GENERAL APPEARANCE OF STREET AUTOMATIC STOKER AS APPLIED TO A LOCOMOTIVE.

THE PROBLEM OF THE AUTOMATIC STOKER

MR. A. G. KINYON, chief instructor for the Street Locomotive Stoker Company, read an interesting paper at a recent meeting of the Richmond Railway Club, upon the experience thus far secured with this device. He stated that fifty-four of these stokers are now in operation on the Chesapeake and Ohio Railway and that forty Mallets were equipped with stokers on the Norfolk and Western. The Baltimore and Ohio have seventy-one locomotives equipped with this device, of which twenty are Mallets and fifty-one Mikados. These companies adopted this type of mechanical stoker after preliminary tests upon one or more locomotives, which proved satisfactory. Mr. Kinyon's talk was illustrated by a number of lantern slides, showing the various features in connection with the stoker and some of the advantages claimed for it. Many of these illustrations are reproduced in the proceedings of the Richmond Railway Club. We reproduce herewith a photograph showing the general appearance of the stoker as attached to the locomotive.

Digitized by Google

the bottom of the bearing, and presses down to a greater or less degree upon the shaft at all times. The wear of the jack-shaft must be taken up about every 3,000 miles. Heavy repairs to the locomotive are made at intervals varying from 40,000 to 60,000 miles, depending largely upon tire wear. About 40,000 miles is considered an average year's service, so that the locomotives are in shops at intervals of from twelve to eighteeen months. These locomotives are equipped for flange lubrication, the cost of such being about 56 cents per thousand miles. The maintenance cost of an electric locomotive unit, for the last six months of 1912, averaged 3.31 cents per mile, of which 2.45 cents represented mechanical maintenance and 0.86 cent electric maintenance. This cost includes all operating overhead charges, but does not include any charges for capital account, nor for charges due to repairs to buildings or machinery. The cost approximates the expenses which are encountered with an 80-ton steam locomotive in heavy high speed service.



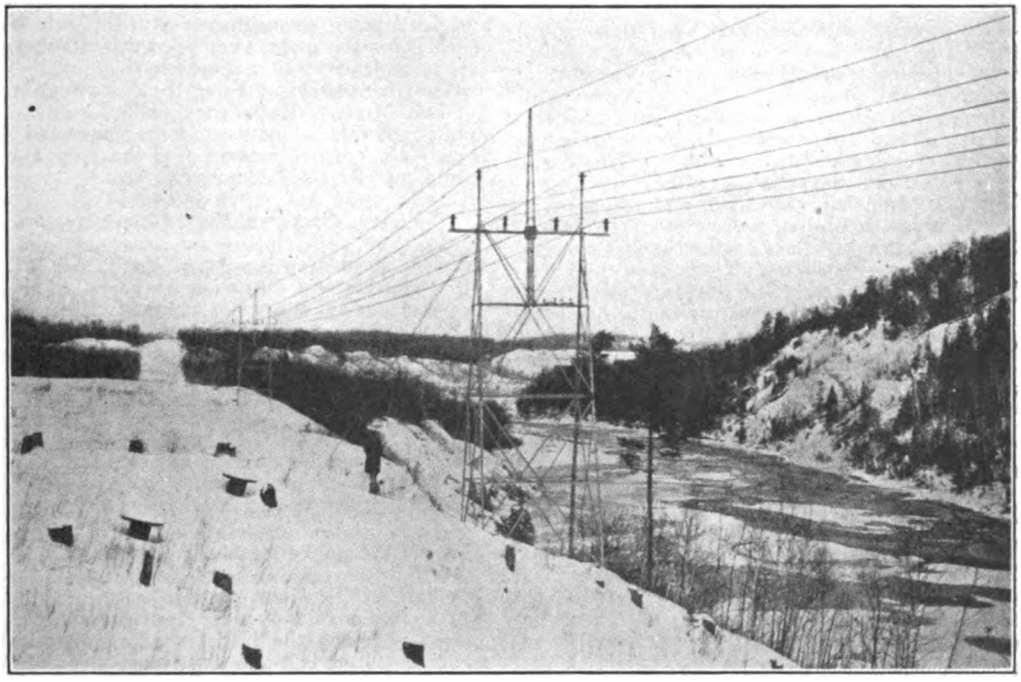
(Courtesy of the *Engineering Magazine.*)

DOUBLE-CIRCUIT STEEL TOWER TRANSMISSION LINE USING SUSPENSION INSULATORS, GREAT WESTERN POWER COMPANY.

St. Paul to Use Overhead Trolley System.

MR. C. A. GOODNOW, assistant to President Earling, of the Chicago, Milwaukee and Puget Sound Railroad Company—the Western subsidiary of the St. Paul—announces that it has been decided to use the overhead trolley system, the type of construction being very similar to that heretofore employed by the New Haven.

As has previously been stated in the RAILWAY WORLD, the company has decided to purchase fifty electric locomotives as the initial order, which are designed to perform the heavy work incidental to hauling trains over the mountain grades encountered. These locomotives are designed to pull a maximum freight tonnage of 2,100 tons up a one per cent grade. It is expected that on the heavy mountain work, the new type of electric motor to be used will run up to 300 miles without inspection, while the ordinary steam locomotive can run only



(Courtesy of the *Engineering Magazine.*)

DOUBLE-CIRCUIT STEEL TOWER TRANSMISSION LINE USING PIN-TYPE INSULATORS, GREAT WESTERN POWER COMPANY.

Digitized by Google

100 to 150 miles without overhauling. We show herewith the type of steel towers employed by the Great Western Power Company, in connection with its high-tension transmission line, which will indicate the permanent character of the construction work to be undertaken by this company, for the purpose of supplying power for the St. Paul's line.

New York Central Extends Electric Service.

ON March 2d, the New York Central placed in operation its electrified extension to Croton, New York. Up to this time, the electric zone extended to Tarrytown, where change was made from an electric to a steam locomotive. The new extension brings within the scope of the electric zone a rapidly growing suburban territory.

Vice-President J. H. Hustis, of the New York Central, in charge of the Boston and Albany Railroad, in appearing before the General Legislative Committee on Railroads of Massachusetts, explained the position of the Boston and Albany as regards electrification. He stated that "I am here also to ask whether the Boston and Albany shall be required to assume an annual net loss in its operation of at least $500,000 per year, as the result in such electrification; and if required to do so, what is to be the effect of such legislation, not only on the property but on the public which it serves?"

Interesting Run of Storage-Battery Car.

AN interesting trial run of a storage-battery car was made on March 6th, between New York and Boston. The car was equipped with a set of new high-power Edison storage batteries. The purpose of the run was to test the efficacy of these batteries under operating conditions. The car, which was on its way for delivery to the New York Central, to be operated in connection with its suburban service outside of Boston, is interesting in that the wheels are free on the axles, and rotate separately, the motor being attached to each wheel by chain drive. The route selected for the run was over the New York Central, Hudson River division, and thence over the mountains to Boston, a distance of 310 miles. The average speed attained by the car was over 30 miles per hour—considerably faster than the regular steam service between these points. It is estimated that the storage-battery car can be operated at a cost of 16 cents per car mile. The purchase price is $18,000. The car has a seating capacity of sixty persons, and will run 120 miles with one charge.

New Haven's Plans for Electrification.

ON or about May 1st, the New York, New Haven and Hartford plans to put into service its new electrified section between Stamford, Connecticut, and New Haven. When this is accomplished, the extent of the electrified zone of this company will be practically doubled, and it will be possible for the New Haven to run through trains from New York to New Haven by electric power. The work of electrifying the new section is in an advanced stage, the iron posts and catenary cross-bridges now being practically installed, and the work of stringing the overhead wires about to be pushed forward.

The yards of the company, at Cedar Hill, New Haven, are being prepared for the stabling of electric engines, as well as for the steam equipment, which will be used to handle trains beyond this point. The completion of the electrification to New Haven will mark the consummation of the plans prepared by President Mellen in 1905. The work has taken longer in execution than it was originally predicted, but this is largely the result of careful experiments on the part of the company before proceeding with large expenditures. The success of this plan is demonstrated by the fact that the plans for the new section differ but slightly from those of the work first constructed. For the present, the power for the new extension will be supplied from the Central Station at Cos Cob. It is planned, however, to construct a new power plant in the near future on the meadow near the Cedar Hill yards, which are situated on the Quinnipiack River. This will allow coal to be brought from the tidewater in barges to the side of the power plant, from which it can be mechanically elevated to the storage bunkers, as is done at the existing power stations of this company.

Already, the New Haven management is planning a further extension to its suburban zone. Surveys have been made for electric service from New York through White Plains, Danbury, Waterbury and New Britain to Hartford. In addition, plans have been made for the four-tracking of the New Haven line between New Haven and Providence. This involves extensive changes of lines in New London, and the construction of a $4,000,000 bridge at that point. A proposition has been made to the Connecticut Legislature to sell to the State the existing draw-bridge over the Thames for highway purposes. In addition a considerable number of grade crossings must be eliminated. Two commissions have been appointed for the purpose of deciding upon plans to this end, and for making arrangements with the local communities for the apportionment of the cost thereof.

It is anticipated that the next step in the formation of plans will involve the electrification of the line between Providence and Boston. The time is not far distant when a passenger can ride from New York to Boston over the New Haven behind an electric locomotive.

Great Northern Not to Electrify.

THE filing of pre-emption claims for hydro-electric and irrigation purposes, of 25,000 inches per second of Columbia River water at Rock Island, where the Great Northern crosses the Columbia, started a series of newspaper statements, that the Great Northern had decided to electrify its line between Puget Sound and Spokane, and that this was the first step in the execution of the plan. President C. R. Gray, of the Great Northern, however, is reported to have said that "we have no present intention of electrifying the line between Seattle and Spokane as reported."

Chicago Terminal Electrification.

CHICAGO railway terminals have taken the first steps towards electrification by announcing the transfer of all interchange switching to the belt and new transfer yards. The bulk of freight switching will be done outside of the city. It is reported that those in charge of the new union station state that no steam engines will be operated in the depot.

Digitized by Google

for the Union Passenger Station to be erected at Chicago at a cost of $25,000,000. Acting for all the roads interested, the Pennsylvania bought a tract adjoining the site. The building, which is to be monumental in character, will be built on the block bounded by Canal, Clinton, Adams and Jackson streets. The additional tract acquired by the Pennsylvania is on the east side of Canal street, between West Washington and Randolph streets.

New Chicago Freight Yards.—Chicago and Western Indiana has begun additional condemnation suits in the southwestern part of Chicago in connection with the projected freight interchange yards at the clearing formerly called the Stickney Tract, which will be the largest of its kind in the world. Belt Railway directors have approved final plans and work begins immediately with expectation of completion within year. Project includes elaborate arrangements for less than carload freight to effect further economy and efficiency in operation besides relieving downtown congestion. Fourteen industries are already located in that district, where residence and business subdivisions will be put on the market this spring.

It is claimed that the new yards will remove the greatest obstacle to electrification, reverse the freight flow, leaving downtown business only for downtown stations and tracks, decrease the railway smoke nuisance 50 per cent, save one day in passage of freight in and out, making exchange and classification between roads possible in one fourth the present time, create a new warehouse and manufacturing city at Clearing, lead to probable eventual union of all belt lines and all railways in one great clearing house, minimize heavy trucking through downtown streets, reduce to railways and shippers loss through congestion, delay, rehandling and switching.

New Railroad Yards at Paducah.—In connection with the new bridge over the Ohio River between Paducah, Ky., and Metropolis, Ill., which the Big Four, Burlington, Chicago and Eastern Illinois and Nashville, Chattanooga and St. Louis are to erect at a cost of $5,000,000, purchase has been made of 800 acres of land at Paducah, on which will be erected repair shops, union passenger station and a classification yard of 4,000 cars capacity. Improvements exclusive of the bridge are expected to cost between $3,000,000 and $5,000,000.

Lake Shore Shops at Ashtabula.—President Brown, of the New York Central, confirms the dispatch published in *The Wall Street Journal* to the effect that the Lake Shore and Michigan Southern Railway has purchased land at Ashtabula, O., on which to erect steel car repair shops. President Brown states that on account of the large number of steel freight cars now in use, and the movement of coal and ore traffic through Ashtabula for which these steel cars are largely used, it is deemed advisable to provide repair facilities at that point. The plant including the land will cost in the neighborhood of $1,000,000.

Repair Shops for Chicago and North-Western.—The Chicago and North Western Railroad has perfected plans for new repair shops at Clinton, Ia., which are to cost when fully equipped $500,000. The shops will be located where the company has ample ground for enlargement from time to time in the future.

Work on New Orleans Terminal Begun.—The Texas and Pacific Railway has started construction of its new terminals at New Orleans on property recently acquired. The property secured involves seventeen city blocks with a river frontage and when improvements are completed will give the company, it is said, the best terminal facilities in the city of New Orleans.

The terminal project will be constructed and conducted under a separate organization known as the Trans-Mississippi Terminal and Warehouse Company. This company will execute a mortgage covering its property to secure an authorized issue of $10,000,000 bonds.

No definite plans for permanent financing have yet been arranged, but it is expected that approximately $5,000,000 will be needed to cover the purchase and construction requirements for the immediate future. The Gould estate has temporarily loaned the company $2,700,000 to cover the purchase price of the real estate, and the company's bankers have advanced another $1,000,000 for immediate construction requirements.

These advances will later be financed either through sale of bonds if market conditions are favorable or through sale of short term notes secured by deposit of the bonds. The New Orleans city council has passed ordinances which will give the company perpetual rights within city limits, and the area covered by the new acquisition will, it is said, provide against the company's tidewater terminal requirements for the next hundred years.

Railroad Dock Requirements at New York.—Calvin Tomkins, dock commissioner of New York, has reported to the Board of Estimate another step in the negotiations for the development of a freight terminal in South Brooklyn. The Board had referred to him on February 20 a letter from Ralph Peters, chairman of the committee representing the Trunk Line railroads, saying that the scheme could not be carried through unless the present tracks of the Bush Terminal and the New York Dock Company were included.

Mr. Tomkins consulted with Irving T. Bush, president of the Bush Terminal, to ascertain the price at which he would sell the railroad property controlled by him. Mr. Bush answered that he was not willing to place any figure on it.

"This is partly due," he wrote, "to the fact that I still hope you will conclude that the proposition submitted by me last September will be acceptable to the city authorities, but also because the railroad yards are under our general mortgages, and therefore can only be acquired by condemnation."

Mr. Bush went on to outline a plan whereby a valuation might be reached. The chief feature in his plan was the provision of a committee of three appraisers to determine the value.

Commenting on the project, Mr. Tomkins said in part:

"J. J. Hill has rightly stated that the railroad system of the country has broken down at its city terminals. I carry the thought farther by suggesting that the only remedy will be for the cities to provide the railroads with public terminals, free from taxation, at rentals not to exceed interest and amortization, and with the proviso that the charges of the terminal companies for service shall be limited to such rental, plus reasonable operating expenses. In other words, if the city is

Digitized by Google

to relinquish all exploitation profits, the terminal companies will be expected to do so too and provide good service at minimum cost."

Improvements on the Baltimore and Ohio.—The details of an extensive program of improvements which the Baltimore and Ohio System is about to commence on the Somerset and Cambria division, between Johnstown and Rockwood, Pa., has been made public. The work will cost approximately $1,500,000 and will be started, it was explained, just as soon as the sanction of the city authorities of Johnstown can be obtained, authorizing the railroad company to proceed.

The improvements will include modern passenger and freight facilities and large yards in Johnstown, more than doubling the present capacity of the Baltimore and Ohio's facilities there; construction of passenger and freight facilities which will enlarge the capacity of the terminal at Somerset, building long passing sidings and heavy steel bridges on the Somerset and Cambria division which will provide a double-track on a considerable stretch of the line, new passenger station at Rockwood and the construction of a new low-grade line between that point and Garrett, Pa.

The improvements will be provided to meet the increased demands of business in Johnstown and vicinity and to enable the road to handle the vast coal traffic from the Quemahoning fields with every possible facility.

Larger Facilities at Cincinnati.—Extensive improvements are to be made in the McLean Avenue yards of the Cincinnati, New Orleans and Texas Pacific Railway (Queen and Crescent Route), in Cincinnati according to announcement by General Manager Horace Baker. Eight new tracks are to be constructed and present tracks will be rearranged. This improvement, giving a considerable addition to the McLean Avenue yards and also a more efficient arrangement of the various sidings, including the repair tracks, will be of great advantage in handling the heavy business that moves over the Queen and Crescent Route and the Southern Railway.

Interstate Commerce Commission

Change in Personnel.

THE change of National Administration brought with it a number of interesting developments affecting the Interstate Commerce Commission, the most important of which was the reapointment by President Wilson of Commissioner E. E. Clark and his immediate election to the chairmanship of the Commission to fill the vacancy made in that position by the appointment of Commissioner Franklin K. Lane to the Secretaryship of the Interior Department. It will be remembered that President Taft, shortly before the inauguration of President Wilson, made an effort to reappoint Commissioner Clark, but the Senate failed to act on the nomination. President Wilson is to be highly complimented upon his action in this matter and through it the Commission has been able to retain the services for six more years of one of its most valuable members.

E. E. CLARK.

Who was recently re-appointed to the Interstate Commerce Commission by President Wilson, and subsequently elected as Chairman of that body for the ensuing year.

JOHN H. MARBLE,

Late Secretary of the Interstate Commerce Commission, who has been appointed a Commissioner by President Wilson.

Prior to his reappointment Chairman Clark had been a member of the Commission for six years, having been originally appointed by President Roosevelt in 1906. He began his career as railway brakeman and was later made a passenger conductor. This position he held until 1889 when his unusual qualifications led to his selection as grand senior conductor of the Order of Railway Conductors. The following year he was elected grand chief conductor. His leadership proved an inspiration to the entire order and under his wise administration its membership increased from

Digitized by Google

12,000 to 38,000. While in this position he was appointed by the President of the United States as a member of the Anthracite Coal Strike Commission of 1902. His entire career has evidenced an integrity, fair mindedness and close application to duty which has won him many friends.

J. H. Marble, who only a year ago was elected secretary of the Interstate Commerce Commission, was also appointed a commissioner by President Wilson to fill the vacancy made by the withdrawal of Commissioner Lane. Mr. Marble was with the Interstate Commerce Commission as an attorney for several years before he was appointed to the secretaryship. He came to that body from California in 1906 as a confidential clerk. He was born at Ashland, Nebraska, in 1869, and was educated at the University of Nebraska. For a number of years he was in the newspaper business in South Dakota, Wyoming and California, and in 1902 was admitted to the Bar of California.

The appointment of Mr. Marble as Commissioner left vacant the position of secretary which has been filled by the appointment of George B. McGinty. Mr. McGinty entered the service of the Interstate Commerce Commission in November, 1908, in the division of Statistics and Accounts. He subsequently served as confidential clerk to Commissioner Clements, and when Secretary Moseley died, the duties of the secretary's office fell to a great extent to the office of the chairman, and in this way Mr. McGinty became familiar with the duties of that position. While Mr. McGinty was appointed by the Commission as special examiner in October, 1911, he was retained in the chairman's office through the chairmanship of Commissioner Clements and likewise served in a similar capacity to Chairman Prouty. When Mr. Marble was appointed secretary in February, 1912, Mr. McGinty was made assistant secretary, which position he held until his present appointment.

Mr. McGinty was born in 1878 in Monroe county, Georgia, and is a graduate of Emery College of Oxford, Georgia. He has studied and practiced law and has seen railway service as soliciting agent for the Atlantic Coast Line, in the local freight office of the Georgia Railroad and as private secretary to the vice-president and general manager of the Southern Railway. When the meat inspection bill was passed in 1906, Mr. McGinty entered the service of the Bureau of Animal Industry of the Department of Agriculture and was largely engaged in handling correspondence with the carriers respecting conformance by meat shippers and carriers with the regulations of the Department.

The recent changes in the personnel of the Commission are apt to have an important effect on rate regulation in the future, and it is believed, as now constituted, the Commission represents a more conservative body than during the Taft Administration. It is also to be hoped notwithstanding the fact that Mr. Lane has become a member of the Wilson Cabinet, that the new Administration, on account of recent developments, will look with more favor upon the proposition of higher rates than the Taft forces did. It is practically certain that some action must be soon taken by the railroads to strengthen their financial position, if they are to procure the funds necessary for the expansion which is constantly being demanded by larger commercial demands.

GEORGE B. MCGINTY.
The Commissioner's New Secretary.

Physical Valuation.

CONGRESS has set the Commission a gigantic task in passing the physical valuation bill, but the Commission is not, as has been suggested, staggered by the duties that have been placed upon it. As Chairman Clark states, "the work will be approached and proceeded with in a business-like, impartial and thorough way. Necessarily, it will take some time. Just how long, no one knows." The following statement recently made by the new Chairman regarding the general subject of the valuation of railroads, is of particular interest at the present time:

"The law requires that the rates, fares, and charges of the carriers shall be reasonable. Their revenues may not, therefore, be reduced below the point of reasonableness. The courts have held that a common carrier or public service corporation is entitled to earn a fair return upon the value of the property that is devoted to the public service.

"Manifestly the fair return upon the value of the property cannot be determined until the value of the property is known. The courts have indicated certain factors that are to be taken into consideration in determining the value of the property, but have been careful to say that there are other factors besides those named which might enter into the determination.

"In one important case involving advanced rates upon a commodity that moves in large volume, the carriers presented to the Commission voluminous testimony as to the value of their properties. This testimony was uncontradicted, as no one aside from the carriers themselves had any reliable information or data upon that subject. The advanced rates were, in part, allowed, and in part condemned. The rates prescribed by the Commission were established by the carriers, but the validity of the order was challenged in the courts, on the ground that the rates were confiscatory.

"Exhaustive testimony was presented before the court in which the carriers again proved the value

Digitized by Google

of their properties, and, strangely, those values for each of two carriers were something like $100,000,000 more than those which had been proven before the Commission a comparatively short time before. And it was not because of additional investment or improvement in the interim. The Commission was finally upheld by the Supreme Court of the United States.

"But suppose that the carriers had proven the value of their properties to have been much greater than they did. Who could have disproved the claim? Who knows the value of the property of a single carrier? One expert would say that the value is to be measured by its original cost. Another would say that its outstanding or authorized stocks, bonds, notes, and floating debt represents its value. Another would take the position that its true value is what it would cost to reproduce it.

"This question and the many difficulties that are necessarily connected with fair, dependable, and final answers to it, have been studied by those who think deeply on such matters, and the Congress has provided a means for securing reliable, authentic, and exhaustive information upon which to base a determination of the original cost, the present and the reproductive value of these properties that exist under public franchises and perform public functions. When these have been ascertained, the Commission will find the values of the several carriers and the values so fixed will be prima facie evidence in the courts. The owners of the properties are guaranteed a hearing upon any objections which they may desire to present against the valuations first proposed by the Commission, and which objections will be fully heard and carefully considered before final determination is reached.

"The work is one of great magnitude, but the Commission is not, as has been suggested, staggered or dazed by the duties that have been placed upon it. The work will be approached and proceeded with in a businesslike, impartial and thorough way.

"It is desirable that it should be done with as much dispatch as is consistent with accuracy and thoroughness. Necessarily, it will take some time. Just how long, no one knows. The amount of available funds, the number of available, competent men and the time necessary to be spent in securing reliable information as to financial matters in the past, which must be traced back through changes in ownership, reorganization, consolidations, sales and leases, all bear directly upon the question of how soon the work can be completed. There need be, I think, no apprehension that Congress will fail to provide all necessary funds. That the Congress does not underestimate the magnitude of the work or the time necessary for it is evidenced by the provision for reports to the Congress at the opening of each regular session."

Private Car Investigation.

THE Commission has instituted an investigation into the operation of private car companies that is regarded as one of the most important ever undertaken by the federal body. The United States Steel Corporation, the Standard Oil Company, the big packers and brewers and fruit growers' associations, all operating private cars are concerned. The primary purpose of the inquiry is to determine the relations that exist between the railroads and the private car companies.

It was stated by officials that the Commission has been deluged with complaints by independent packers, brewers, stockmen, coal mine operators, oil men, dairy products men and others that the private car is being used as a means of paying rebates and that independents who do not own them are placed at disadvantage thereby.

Every railroad in the United States also has been directed to furnish the Commission at the earliest practicable date all information in their possession with regard to private cars, their contracts with private car companies and with individuals owning private cars.

An important feature of the investigation is that it will put up to the Commission the question as to whether a carrier should itself own equipment capable of satisfactorily carrying the commodities it undertakes to transport.

For some time the Commission has been quietly conducting an inquiry into the management of private cars and it has unearthed a condition that the officials believe warrant a thorough investigation. The Commission already has developed the fact that there are no less than 1,200 private car companies in the United States, which by lease or other arrangement obtain revenue from the railroads. The Commission wants to know whether there is an interrelationship that enables the railroads to own the private cars and then to pay for their use. There is a suggestion that the railroads control the private cars through holding companies.

There was sent out to officers of the 1,200 private car companies a series of interrogatories designed to determine their relations with the railroads. The questions were preceded by a statement setting forth that it was the intention of the Commission to hold hearings at various places throughout the country and that the answers were to be used as the basis of the hearings.

The statement further sets forth that if the private car companies or owners of private cars failed to furnish the information sought the Commission would resort to its power of subpoena to secure it.

Commissioner McChord has been placed in charge of the investigation. He has designated George P. Boyle as chief examiner to collect the information and direct the work of special examiners.

In beginning this inquiry the Commission has for the first time called on the public for information. It has prepared a circular addressed to "Users of private freight cars," and which, after outlining the nature of the investigation, says:

"It is the desire of the Commission that all shippers or associations interested in this investigation communicate to it not later than March 31 such information as may be in their possession and which they consider pertinent to the inquiry."

Report on Water Lines.

TWENTY-FOUR questions have been sent to the railroads by the Commission requesting information relative to the ownership or control of water lines or vessels. This was under the authority of the Panama Canal act, which prohibits the use of the canal to vessels owned by railroads. The terms of the new law will affect water traffic in all sections of the country, as well as coastwise through the canal. The

Digitized by Google

railroads are directed to file their answers by April 15.

Following the usual preliminary questions, the roads are asked to file tabulated data relative to the ownership, control or lease of

Any carrier engaged in transportation by water, or

Any carrier having any proprietary interest in vessels or other property used in transportation by water, or

Any carrier engaged in ferry, lighterage, or towing service, in which the reporting carrier on June 30, 1912, had—

An interest in the nature of control, either directly by stock ownership, or directly through an intermediary company, or

An interest through lease or operation of property under permit or other agreement, or

An interest in common by reason of directors or stockholders in common, or of like relations to a holding company, or in any other manner.

Relative to chartered boats the roads are asked to give the following facts:

Name of vessel.
Class of vessel.
Gross and net tonnage.
Kind of service in which engaged.
Period of charter.
Form of charter.
From whom chartered.

All the data called for is to indicate the condition as of June 30, 1912. Besides the control and ownership of vessels, the roads are asked to give similar detailed information relative to their ownership, control of dock facilities and water front property. They are asked to give the tonnage handled at the ports which they serve, dividing the tonnage into products of agriculture, of animals, of mines, of forests, manufactures, merchandise and miscellaneous. The roads are further requested to give information relative to the issuance of bills of lading for import and export traffic.

Question 21 is as follows:

"If the reporting carrier is affiliated with any steamship company, or any carrier by water, coastwise or foreign, through agreements or through any understanding or working arrangements, as regards the exchange of traffic or division of rates, and if the terms of the agreements, understandings, or arrangements have not been furnished in answer to any of the foregoing questions, give the names of such carriers and state in connection with each the essential terms of each agreement, understanding, or arrangement."

The questions go into the details of stock ownership, the class of securties held and how acquired in water lines.

The Cost of Freight Service.

A LIST of questions have been sent to the railroads by the Commission designed to gather data relative to the cost of passenger and freight service. The roads are requested to file their answers by April 30. This is one of the steps understood to have been advised by Commissioner Meyer by which it is hoped to arrive at a scientific basis for rate making. Commissioner Meyer had the statisticians of the Commission make some investigations beginning last spring into this question and railroad officials were asked to make recommendations relative to it.

In the letter of transmittal the roads are informed that.

"These inquiries are made in order to learn the extent to which and the manner in which railway companies in the United States now make a separation of operating expenses between freight service and passenger service and to obtain the results of such separation, wherever made, for a particular year, preferably for the year ended June 30, 1912. Certain statistics of operation for the period covered by the expenses assignment herein reported are also requested for use in interpreting the expense data submitted.

"Certain carriers regularly make a complete separation or apportionment of operating expense between freight service and passenger service. Other carriers select certain primary expense accounts and separate only those between the two services, making no separation of the general expenses. Each carrier within the scope of the order shown hereunder is required to make returns for as many of the primary accounts as existing records will permit. If these separations cannot be furnished for the year ended June 30, 1912, the calendar year or other twelvemonth period may be substituted, proper modifications of printed dates being made."

Chief Inspector Urges New Safety Rules.

CHIEF Inspector of Safety Appliances Belnap, in reporting on two Ohio wrecks, has called the Commission's attention to the inadequacy of certain standard code rules of the railroads. The first report was concerned with the rear-end collision on the Pennsylvania lines west of Pittsburg, near Dresden, O., on December 3 last, when nine passengers and two employes were killed. The standard code dule governing in this instance is as follows:

"Unless some form of block signal is used, trains in the same direction must keep at least five minutes apart, except when closing up at stations."

Mr. Belnap reported: "This rule provides proper spacing of trains only in the vicinity of open stations. Should these open stations be far apart a fast train could easily overtake a slow train, while should a train come to an unexpected stop, as was the case in this instance, it might be impossible for the flagman to go back the distance necessary to protect his train. This rule is believed to be entirely inadequate to insure proper protection."

The second report dealt with the accident on the Pittsburg, Cincinnati, Chicago and St. Louis Railroad, near Bowerstown, O., on December 13 last. Mr. Belnap criticised the following flagging rule of the company:

"When a train stops or is delayed under circumstances in which it may be overtaken by another train the flagman must go back immediately with stop signals a sufficient distance to insure full protection. When recalled he may return to his train, first placing two torpedoes on the rail when the conditions require it."

Commenting on this Mr. Belnap said: "The only absolute requirement of this rule is that a flagman must go back immediately with stop signals. How far he shall go back, and whether or not he shall use torpedoes, are matters that are left entirely to his judgment of what the particular situation requires. When considered in connection with safety in the movement of trains, the flagging rule is of paramount importance, and

Digitized by Google

its requirements should be as absolute as it is possible to make them. It should be incapable of more than one construction, entirely free from uncertainty or indefiniteness, leaving no room for error of judgment by a flagman when such error may prove disastrous."

Greater Safety Order.

THE Commission has issued orders to its safety appliance and other inspectors to tighten up in the inspection of railroad equipment. Commissioner McChord, who has charge of safety appliances and similar matters, has decided that the so-called human equation excuse has been worked overtime in view of reports which have been made to him as the result of an investigation which he started. It is reported that the Commission has decided that it will not compromise any more cases and that no excuses will be accepted.

The Commission has been considerably worked up for more than a year by the many wrecks and loss of life and Commissioner McChord states it intends now to go forward and prevent wrecks by showing railroads how to do it rather than by investigating them and holding coroner's inquest. He may rest assured he will receive the hearty support of the carriers.

New Baggage Regulations.

A DECISION has been issued by the Commission approving, with minor exceptions, the new regulations of the railroads regarding baggage. The regulations apply on all the railroads of the country, and when first proposed were suspended and investigated by the Commission. Chairman Clark, summarizing the decision of the Commission, said:

"Carriers may reasonably provide for an extra charge for the transportation of pieces of personal or sample baggage, excepting whips in cases, having dimension or dimensions exceeding 45 inches such charge per inch is excess of 45 will not be accepted for checking as baggage.

"Respondents must provide for checking as baggage, whips in flexible cases not exceeding 90 inches in length, nor 12 inches in diameter at the base, nor 100 pounds in weight.

"Carriers may reasonably provide that a piece of baggage exceeding 72 inches in any dimension will not be accepted for checking.

"Upon notice of not less than one year carriers may provide that trunks or other rigid containers with more than two bulging sides, or with two bulging sides that are not opposite to each other, will not be accepted for checking as baggage.

"Carriers' definition of sample baggage should permit including therein salesmen's catalogues.

"Where the charges for excess weight and excess dimensions do not exceed the minimum charge, the single minimum charge shall apply."

The restrictions proposed by the railroads were bitterly fought before the Commission by many commercial associations and actors, who recognized they would be limited in the privileges they previously enjoyed.

The new rules as modified by the decision of the Commission are to take effect April 29.

Revised Rules on Foreign Freight Tariffs.

THE Commission has issued revised regulations covering the issuance of freight tariffs by railroads. Possibly the most important change was made in the rules regarding import and export traffic, which now reads as follows:

"The inland carriers of traffic exported to or imported from a foreign country not adjacent must publish their rates and fares to the ports and from the ports, and such rates or fares must be the same for all, regardless of what ocean carrier may be designated by the shipper or passenger. In order to avoid controversies and questions, tariffs hereafter issued containing rates applicable to export or import traffic shall specify by inclusion or exclusion the countries to or from which shipments to which such rates are applicable shall move, whether such countries are, or are not adjacent to the United States. In the interest of clearness the tariffs should also specify whether or not shipments to or from Cuba, the Philippine Islands, Porto Rico or the Canal Zone are included. For convenience, and without regard to the political status and relation of the Philippines, Porto Rico and the Canal Zone to the United States, they, together with Cuba, are for these purposes to be classed with foreign countries."

Uniform System of Weighing.

THE Commission has completed its investigation of the weighing facilities of the railroads of the United States. The final hearing was held at Chicago recently after more than a year of investigation, during which time the Commission has been told many times by shippers that the weighing apparatus is inaccurate and irregular. It is expected that the Commission will make important recommendations to the railroads for improvement of conditions along these lines, and that it will seek to formulate a rule which will be fair to both the shippers and the carriers.

Cars for Shipping Flour.

IN denying reparation in the case of the Southwestern Millers' League against the Union Pacific, the Commission has entered a decision dealing with the preparation of cars for shipping flours which holds that lining and padding cars for flour shipments partakes of the nature of private packing rather than of public equipment. Provisions for reimbursement of shippers for such expenditures, the Commission said, would be susceptible of use as a subterfuge for payment of rebates.

The roads were instructed to furnish cars in good repair, clean, and in proper condition for transportation.

Long and Short Haul Clause Case.

ARGUMENTS were presented on March 17, before the Commission in the Long and Short Haul case involving the class and commodity rates of the railroads in Southeastern territory. This case included all the rates from New York City, Ohio River crossings and New Orleans, La., to South Atlantic and Gulf ports, points on navigable rivers, etc. Walton Moore appeared for the majority of the Southern roads, and in connection with his arguments presented a brief of several volumes.

The railroads contended that they should be permitted to continue to charge higher rates to the intermediate points than to the Coast points

Digitized by Google

owing to the nature of the competition. It was said that the present rates are determined by water competition, competition between markets of production, competition between markets of distribution, competition between markets of consumption and competition between commodities transported.

Speaking of the rates from points in the Mississippi Valley to points in the Southeastern territory, Mr. Moore said that roads which file reports would stand to lose $12,786,841.17 per annum if the long and short haul clause of the law is strictly applied, whereas the gross freight revenue of the same roads is but $191,141,585. The ratio of loss would be 6.69 per cent. Estimating from this same percentage, he said the loss accruing to the non-reporting roads would be $3,138,022.17, making a loss to all the carriers in this section of $15,924,863.34.

The attorney said that the net surplus of all the roads in the Southeast during the fiscal year of 1910-11 was $36,903,521. After deducting the loss incident to a strict application of the fourth section law in this section of the country the surplus would amount to only $20,978,668.

It was argued that not to grant the petition of the railroads and permit them to continue the present basis of rates would work a hardship. The water competition on the Atlantic Coast was declared to dominate the situation.

"From as far west as Kansas City, Mo.," said the attorney, "the trunk line and water rates via New York are less to the south Atlantic ports on some of the classes than the direct all-rail rates. The Memphis route is the short line, a distance of 1,212 miles. The Cairo route is but 17 miles greater, and the New York route is 347 miles greater. The rates via New York, combination of rail and water, are 5½ cents on first class freight, 6 cents on second class, and ½ cent on third class, higher than the all-rail rates from Kansas City via Memphis or Cairo, and 14 cents on fourth class, 13 cents on fifth class and 10½ cents on sixth class, lower than the all-rail rates through Cairo or Memphis. This shows that the water lines control the rates."

Decisions and Rulings for March.

THE mill of the Commission turned out its usual grist of rulings, decisions and suspensions during the month of March.

The most important suspension was that of the supplement of grain tariffs filed by carriers operating in the Central Freight Association territory. These supplements advance rates for the transportation of grain and grain products from points north of the Ohio River and east of the Mississippi River to interstate points, generally speaking, from one-half to one cent per hundred pounds and in some instances to three cents per hundred pounds. And in some instances to three cents per hundred pounds. The increases, which were to become effective on March 15th, have been suspended until July 8th, and in the meantime the Commission intends to conduct an exhaustive investigation as to the reasonableness of the advances.

Other suspensions include advances in lumber rates between points in Louisiana and Mississippi and Memphis, Tenn., until September 12th; increased rates on grain and grain products proposed by the Rock Island from Chicago, Missouri and Mississippi rate territory to destinations in Oklahoma and the Southwest until July 5th; advance in rates on bricks from Chanute and other points in Kansas to Iowa and Illinois, until July 1st; advances in rates on hay in carloads from St. Paul and Minneapolis and other points to Ohio River crossings, until July 1st; advances in rates on asphalt and asphaltum from points in Kansas to St. Louis, until September 1st; advances in rates on pig iron in carloads from points in upper Michigan and Minnesota to Kansas City and other points until August 26th and advances in the rates on lumber and articles taking lumber rates, from Texas points to stations in Oklahoma, Kansas and Missouri, until June 23d. The Commission has also suspended until July 12th, certain schedules which propose to cancel the absorption of lighterage and floating charges of three cents per hundred pounds on carload and five cents per hundred pounds on less than carload traffic handled by the Chicago River and Indiana Railroad Lighterage and Float Service to and from points on the Chicago river front. This virtually amounted to an increase of rates to that extent. Freight tariffs of the Chicago Great Western Railroad, which cancel milling and transit privileges of shippers at Minneapolis, have also been suspended until June 20th, while the new baggage regulations contained in tariffs filed by the Midland Valley and the St. Louis Southwestern railroads have been further suspended until August 25th. These regulations would place restrictions on baggage exceeding certain dimensions both east and west of the Mississippi River. Freight tariffs of the Baltimore and Ohio and other railroads providing for the discontinuance of free store-door delivery and pick-up service in Washington, have been suspended until June 28th. This service is at present extended to shippers and consignees on less than carload shipments, originated at or destined to points north of Wilmington, Del., and including New York and Boston.

Rate Increases Improved.

THE Commission approved a number of rate advances during the month which included the following:

A rate of $2.10 per ton on coal from the Pocahontas fields in Virginia and West Virginia to Winston-Salem. The Commission held, however, that the rate of $2.00 per ton from the same points of origin to Martinsville, Virginia, is excessive to the extent it exceeds $1.80. An advance in the rate on pig iron in carloads from Wharton, New Jersey, to Harrisburg, Pa., to $1.15 was allowed, as were also advance rates on linseed oil from St. Paul and Minneapolis to the South and West; advances in the freight classification on bicycles in Official Classification territory and on pepper in the Western Classification territory and advances in the rates on wheat and corn from Joplin, Mo., to New Orleans and Mobile.

Recent Decisions.

AMONG the more important recent decisions of the Commission are included the following: An order to withdraw the proposed advances in rates on fresh meats and packing house products from Oklahoma City, Fort Worth and Wichita to all points on the Santa Fe System in New Mexico, excepting coast line points west to Albuquerque. Present corn rates from Kansas City, Mo., to Shreveport, La., are held to be reasonable and the complaint against them which was for the purpose of establishing

Digitized by Google

a two-cent differential between the proportionate rates on corn and corn products, is dismissed. The fact that mills located in Texas, Arkansas and Missouri have a lower rate than the Louisiana mills is due, according to the Commission, to a more advantageous location in being nearer to the corn-producing markets. The proposed advance in the minimum weight on ear corn, snapped corn and corn in the shuck from the Southwest in carloads of 40,000 pounds is held unjustifiable. A flat minimum weight of 40,000 pounds, however, is found to be reasonable when standard 36-foot cars or larger, are furnished.

Beet sugar rates are also found to discriminate against beet sugar factories in Ohio and Michigan. Rates of the Louisville and Nashville from Cincinnati and points Northwest to Knoxville and Chattanooga have been found unreasonable when compared with rates from New York, Philadelphia, Baltimore and New Orleans. A discrimination is created against Chicago and Ohio and Michigan points that is declared to be unjust and unlawful. The rates of the carriers south of the Ohio are ordered corrected.

The present adjustment of rates on leather from points in western North Carolina on the lines of the Southern Railroad, are held to be reasonable. The re-establishment of through rates on coal from mines in Colorado and New Mexico to points in Oklahoma and Texas on the Wichita Falls and Northwestern Railroad and allied lines, has been ordered. The Missouri Pacific and other railroads have been ordered to withdraw the freight tariffs cancelling present joint rates and through routes on cottonseed from points in Oklahoma to Little Rock, Arkansas; the Southern Pacific Company has been ordered to withdraw the proposed advances in rail and water rates on cypress lumber from points on the New Orleans, Texas and Mexico Railroad between Baton Rouge and New Orleans to interior points in the North Atlantic States; rates on granite and stone blocks from Louisville, Ky., to Lebanon, Ky., as a part of the through rates from Barrick, Vt., and Bedford, Ind., are held to be unreasonable and reductions ordered; increases in rates on coal from the Illinois mines in the Springfield district to points in Iowa have been prohibited. The Commission holds that the proposed increases were for the manifest purpose of obtaining for the Chicago, Burlington and Quincy Railroad, a practical monopoly of the coal business for the group of mines on its line. It is ordered that the present rates shall remain in force for two years; rates on beet sugar in carloads from Cincinnati to Knoxville and Chattanooga, Tenn., as compared with the rates from competing markets to same destination are held to be unduly favorable to cane sugar between New York, Philadelphia, Baltimore and New Orleans.

In dismissing the complaint of the Morris Iron Company of Frederick, Md., against the Baltimore and Ohio Railroad Company and others, the Commission holds that it has no jurisdiction to order a physical connection between the Baltimore and Ohio and the Frederick railroads, at Frederick.

ORGANIZATION NOTES.

Mechanical Engineers to Discuss Steel Car Construction.—A meeting of the American Society of Mechanical Engineers will be held in New York on the evening of April 8th, under the auspices of the Railway Committee for the purpose of discussing steel car construction and the latest developments of the art. A number of engineers have consented to contribute ten-minute discussions on the phases of the subject in which they are particularly interested.

Some of the phases which will be taken up are: Problems of Steel Car Design, Suspension of Steel Cars, Trucks of Steel Passenger Cars, Provisions for Lighting in Steel Cars, Provisions for Electrical Equipment in Steel Motor Cars, Special Ends for Steel Passenger Cars, Draft Gears for Steel Passenger Cars and Cast Steel Double Body Bolts and End Frames for Steel Cars.

The following program indicates the comprehensive manner in which the topic is to be handled:

Introduction to general discussion of Steel Passenger Cars, H. H. Vaughan, assistant to the vice-president, Canadian Pacific Railway; Interior steel finish, Felex Koch, assistant mechanical engineer, Pressed Steel Car Company; Roof Structures, C. A. Seley, mechanical engineer, Rock Island Lines; Corrosion and protection of steel passenger cars, C. D. Young, engineer of tests, Pennsylvania Railroad; Problem of steel car design, W. F. Kiesel, Jr., assistant mechanical engineer, Pennsylvania Railroad; Suspension of Steel Cars, E. W. Summers, president Summers Steel Car Company; Truck for Steel passenger cars, J. A. Pilcher, mechanical engineer, Norfolk & Western; Provision for electric lighting in steel cars, H. A. Currie, assistant electrical engineer, New York Central & Hudson River; Provision for electrical equipment on steel motor cars, F. W. Butt, assistant engineer, New York Central & Hudson River; Special ends for steel passenger cars, H. M. Estabrook, president, Barney & Smith Car Company; Draft gears for steel passenger cars, S. P. Bush, Buckeye Steel Castings Company; Cast steel double body bolster and end frames for steel cars, C. T. Westlake, chief mechanical engineer, Commonwealth Steel Company.

In order to allow each of the speakers ten minutes and still have plenty of time for discussion the meeting will open sharp at eight o'clock. This is earlier than meetings of this kind ordinarily open in New York City and those who intend to come are asked to come early in order that they may not disturb the meeting after it is opened.

Electrical Night of New York Railroad Club.—The New York Railroad Club held its ninth annual electrical night on the evening of March 21st. There were no set papers but addresses were made by men actively interested in the extension of electricity to railway operations. These addresses which are not at hand at the present time, will be discussed in the May issue of the "Railway World."

Meeting of St. Louis Railway Club.—The March meeting of the St. Louis Railway Club, was addressed by L. T. Shedd, of Chicago, general safety supervisor of the Rock Island Lines, on the general movement begun by railroads looking to a greater safety for their employees. Mr. Shedd laid particular stress on the fact that a large proportion of accidents among railway employees is due to carelessness or lack of re-

Digitized by Google

gard for rules. His lecture was interestingly illustrated by means of motion pictures. Mr. W. N. Northcott, secretary of the Railroad Y. M. C. A. at Chicago also spoke of safety work being done in that city.

Meeting of Railway Engineers at Chicago.—The annual convention of the American Railway Engineering Association, was held in Chicago at Congress Hotel from March 18th to 21st, inclusive. Means for making railway travel more safe were extensively discussed, including plans for the manufacturing of better rails. Reports were received from various committees and consideration given to the subject of rules and organizations, signals and interlocking, iron and steel structures, economies of railway location, wooden bridges and trestles, wood preservation and ties and masonry. Papers were also read on the subjects of the conservation of natural resources, ballast, water service, yards and terminals, electricity and records and accounts. These papers and their discussion will be reviewed at greater length in a future issue of the "Railway World."

Peace Society on Canal Tolls.—The trustees of the Carnegie Endowment for International Peace have published a statement in which they urge the repeal of that part of the Panama Canal Law which grants free passage through the canal to American vessels engaged in the coast-wise trade.

The argument is made that Great Britain has raised a fair issue regarding the interpretation of the Hay-Pauncefote treaty in her protest against the free tolls clause of the treaty and that the United States government cannot refuse to arbitrate the question unless the cause of the protest is removed. Therefore, say the trustees, the clause in the law to which objection has been taken should be repealed in order that the good faith of the United States with regard to the Panama Canal shall be made clear to the world.

The statement is signed by Joseph H. Choate, Andrew D. White, Charles Y. Eliot, John L. Cadwalader, Elihu Root, Luke E. Wright, Charlemagne Tower, R. S. Woodward, Austen G. Fox, J. G. Schmidlapp, Robert S. Brookings, Oscar S. Straus, Samuel Mather, James L. Slayden, Charles L. Taylor, Henry S. Pritchet, William M. Howard, Robert A. Franks, Nicholas Murray Butler, Arthur William Foster, and James Brown Scott.

Freight Car Balances.—The bulletin of the American Railway Association of freight car balance and performance for November, 1912, states that miles per car per day was 26.0, the same as in October, the highest on record. Ten miles per car per day was 424 compared with 433 in the preceding month, and an increase of 12.77 per cent over the corresponding month of 1911. The proportion of cars on line was 48 per cent, a decrease of 10 per cent compared to October.

There was an increase to 75.9 per cent in the percentage of loaded car mileage compared with 73.9 per cent in October 70.8 per cent in November two years ago. The average earnings per car per day of all cars on line were $2.92 as against $3.03 in October, and an increase of 10.61 per cent over the earnings for November, 1911.

Meeting of St. Louis Terminal Board.—At a recent meeting of the St. Louis Terminal Board, plans were approved for the construction of the new passenger station of the electric lines, which, it is hoped, will be opened some time during the coming summer.

Proprietary interests as follows were represented at the board meeting: Missouri Pacific, E. J. Pearson; Wabash, Henry Miller; Louisville and Nashville, G. E. Evans; Baltimore and Ohio Southwestern, W. C. Loree; Vandalia, A. M. Schoyer; Illinois Central, W. L. Park; Chicago and Alton, B. A. Worthington; Rock Island, A. C. Sweet; Southern, T. C. Powell; Burlington, E. P. Bracken; Cotton Belt, F. H. Britton.

Joint Conference on Marketing and Distribution of Food Products.—It is understood that a call for a conference of leading railway, banking and agricultural interests in Chicago on April 8th, has been issued for the purpose of devising means of eliminating the waste in the production of the Nation's food supply, due to absence of a sound financial and business system. Plans for simplifying methods for marketing and distribution will also be discussed. It is understood that a large number of prominent railway officials will attend the conference.

Meeting of Western Railway Club.—At the March meeting of the Western Railway Club, George Bradshaw delivered an address on "Railroad Accidents and their Prevention," and like Mr. Shedd, who recently addressed the St. Louis Railway Club, he held that unwise practices or carelessness on the part of employees, were responsible for a large number of railroad accidents.

"More care," said Mr. Bradshaw, "should be taken in determining the mental and moral qualifications of men employed in responsible positions. There should be an employment bureau on every large railroad having authority to employ men and to make a thorough investigation of the history of each applicant.

"We should have the finest body of men in the world in charge of our trains. Every boy wants to go railroading and we should select the best of them for the service."

The Merchants' Club, of Boston, Discusses New England Railway Situation.—At a recent meeting of the Merchants' Club, of Boston, Theodore N. Vail, president of the American Telephone and Telegraph Company, stated that:

"The placing of the New England railroad system upon the highest lines of efficiency, requires the expenditure of large sums of money. With uniform rates, the revenues of the whole distributed over all would make all self-sustaining and remunerative, and warrant and provide for such expenditures. Why, then, destroy by useless duplication the ability of the better parts of our railroad to carry the weaker parts? The extension of any trunk line through New England would mean such duplication with all its detrimental effects on existing lines, its burden for the public, and without any possible advantage to anyone."

Nominations of the Chicago Traffic Club.—According to an announcement made by the

Digitized by Google

Nominating Committee of the Traffic Club, of Chicago, the regular ticket which was voted on at the annual election of the organization, held on March 25th, is as follows:

President, Guy S. M'Cabe; first vice-president, W. M. Hopkins; second vice-president, Frank W. Smith; third vice-president, L. Richards; secretary, W. H. Wharton; treasurer, C. B. Hopper; directors, F. B. Montgomery, V. D. Fort, C. E. Finch, and H. K. M'Evoy.

Dinner in Honor of President Rea.—On the evening of February 25th, Daniel Willard, president of the Baltimore and Ohio Railroad, gave a delightful dinner at Baltimore in honor of Samuel Rea, who became president of the Pennsylvania Railroad on January 1st. The list of guests included men prominent in railroad, financial and industrial fields, and included a number of railway presidents.

Meeting of Classification Committees.—After a lapse of eighteen months, the Western Classification Committee, held a regular meeting in St. Louis on April 1st for the purpose of considering with the shippers certain changes in classification.

The Southern Classification Committee will meet in Cincinnati, April 7th, and the Official Classification Committee will meet about one week later in Chicago.

Tri-State Passenger Association Holds Annual Convention.—The passenger agents of the railroads of the central States held their Fourth Annual Convention in Springfield, Ill., on March 5th. The States represented were Illinois, Indiana and Missouri. The following were elected officers of the association for the ensuing year: C. J. Guyette, of St. Louis, district passenger agent of the Missouri, Kansas and Texas Railway, president; C. C. Anderson, of St. Louis, district passenger agent of the Rock Island Lines, vice-president; Joseph T. Thompson, of Chicago, district passenger agent of the Northern Pacific Lines, secretary.

Annual Banquet of New England Traffic Club.—The annual banquet of the New England Traffic Club was held in Boston on the evening of March 7th. The principal speakers were: Senator John W. Weeks, of Massachusetts, and Honorable F. C. Stephens, member of Congress from St. Paul, Minn., whose subject was: "The Panama Canal and Its Effect on Commerce."

Luncheon of Chicago Traffic Club.—About 150 members attended the monthly luncheon of the Chicago Traffic Club, Tuesday, March 18th, and heard a very interesting talk by Judge Charles S. Cutting, of the Probate Court, Chicago. Judge Cutting in his address strongly urged the elimination of judicial elections from partisan politics, also an indefinite term of office for judges, thereby making it practicable for the best lawyers to serve the people on the bench.

LEGISLATION.

National.—The passage of the Physical Valuation Bill over-shadowed in importance, all other National Legislation of the past month, so far as the railways are concerned. This bill, which by the President's signature, has become a law, authorizes the Interstate Commerce Commission to investigate, ascertain and report the value of all the property owned or used by every common carrier, subject to the provisions of the act. The Commission is authorized to employ such experts and other assistants as may be necessary. The Commission shall make an inventory which shall list the property of every common carrier and show the value thereof, and shall classify the physical property as near as practicable, in conformity with the classification of expenditures for road and equipment, as prescribed by the Interstate Commerce Commission.

The Senate Committee, on Interstate Commerce, has adopted a report on the subject of further legislation for the regulation of trusts and corporations, the effect of which is to recommend to Congress prompt and far-reaching laws, to strengthen the anti-trust laws already in force. The idea of a commission such as the Interstate Commerce Commission, to aid in the regulation of the great interstate industrial corporations, is favored. These recommendations are discussed at greater length in another section of this issue.

The Workmen's Compensation Bill, which originated in the Senate, has been passed by the House of Representatives, by a vote of 218 to 71. In the Senate, however, it is reported that the committee having this matter in charge, has been unable to agree on the terms of the bill and many Senators, particularly those from the South, object strongly to seeing the State laws superseded. There appears to be little hope that the bill will pass this Congress. The bill to create a Department of Labor with a cabinet officer at its head, passed the Senate just before the close of the Taft administration and was signed by the President. A more extended reference to this is made in another section.

The Annual Rivers and Harbors Appropriation Bill, as finally passed by the Senate, carried an appropriation of over $48,000,000 or an increase of $7,000,000 over the amount authorized by the House.

A significant feature in the development of State Legislation is the number of Full Crew Bills and Labor Compensation Bills which are being introduced and passed by the various State legislators. This shows an unusually aggressive attitude on the part of organized labor and so far as the Full Crew Bills are concerned, is, in most instances, being vigorously opposed by the carriers.

Arkansas.—Acting Governor Oldham has signed the legislative act repealing the Arkansas anti-trust law.

The repeal of the law permits any foreign corporation to engage in business in the State so long as the foreign concern does not seek to regulate prices within the State.

Connecticut.—A bill amending the charters of common carriers in the State and requiring them to furnish free transportation to members of the General Assembly during attendance on legislative sessions, has passed both branches of the legislature. This action has been taken in spite of the warning on Governor Baldwin's part, that such legislation, if passed, would be vetoed.

Digitized by Google

The members who voted for the grab tucked a rider amending the charter of every common carrier, thus making the New Haven road pay for the short-sightedness of Connecticut's solons of 20 years ago.

Illinois.—The Brotherhood of Locomotive Engineers will soon submit to the General Assembly a bill requiring all trains when occupying main tracks to be protected by a flagman, regardless of any block system or signal or yard limits board.

Indiana.—Governor Ralston has signed a bill giving the Indiana Railroad Commission power to order the separation of grade crossings anywhere in the State. An effort was made to limit the power so that the Commission could only order one separation to 200 miles of railroad and not more than one in any county in any one year, but failed.

Maine.—Provision for the appointment by the governor of two citizens of Maine as members of a New England Railroad conference to act in connection with the appointees of other New England governors to consider and report on the best methods of developing and operating the New England Railroad system, is made in an act introduced in the Maine Senate.

New York.—The Full Crew Bill which was vetoed by both Governor Hughes and Governor Dix, has passed the Assembly with but two negative votes. Attempts on the part of the minority to amend the bill so as to empower the Public Service Commission to exempt any railroad from compliance with the bill's provisions and giving it authority to conduct hearings and recommend statutory changes failed.

The bill provides that roads more than fifty miles long shall have three brakemen on freight trains of over twenty-five cars, and an extra brakeman on passenger trains of over five cars.

Officials of railroads operating in New York are voicing vigorously objections against this bill. In a letter to Governor Sulzer, President Samuel Rea of the Pennsylvania Railroad says:

"This measure lays down an arbitrary rule that trains shall be manned by a specified number of men, regardless of the necessities in each case. There must be the same number of men on a passenger train, for example, whether it is a continuous run of 100 miles or a run involving stops at every way station. A fast freight, involving but little work for the crew, must have just as many men as a local freight, with constant switching and continuous work for the men, the whole regulated solely by the number of cars in the train. Such a rule adds an extra and unnecessary brakeman, arbitrarily, to a large number of trains. No additional security is obtained. If there is no additional safety and no increased efficiency in a superfluous crew, and if the public interest is adequately safeguarded through the Public Service Commission, why place upon the railroads—and ultimately upon the public—the burden of a heavy and fruitless expenditure?"

President Mellen, of the New York, New Haven and Hartford, has also sent a letter of protest to Governor Sulzer in which he says:

"This bill lays down a rule providing for a certain number of men on each train, regardless of the work of the train in question. Express freight trains, involving but little work, where the crew is rarely called upon to leave the caboose; express passenger trains, where there is practically no work whatever devolving upon the crew, are required to be manned with substantially the same number of men as local trains, both passenger and freight, where there is a very large amount of work to be done, and the size of the crew is regulated only by the number of cars in the train.

"Such a bill adds seriously to the operating expenses of railroads doing business within the State of New York, and contributes in no way, that I can see, to the safety of passengers, or performs any useful service in connection with the train. The burdens upon all railroad corporations at the present time, through the passage of legislation not dissimilar to that referred to in this letter, are serious, and with the railroads' income limited (for it is well nigh impossible to secure any advance in the prices we receive for the transportation furnished), the enactment of such legislation into law by your approval will add to the burdens and lessen the efficiency of the transportation companies operating in your State."

Other strong letters of protest have been sent to the Governor, by President Brown, of the New York Central Lines, and President Underwood, of the Erie.

Massachusetts.—The Committee on Railroads has reported to the Senate a bill providing a fine of $1,000 or imprisonment of one year, or both, for the officer of any railroad corporation who wilfully violates any law of the commonwealth relative to railroad consolidation.

The bill as reported provides that "any officer or agent of a railroad corporation who wilfully violates any of the provisions of section forty-seven or of section fifty-seven of Part II of chapter 463 of the acts of the year 1906, as affected by chapter 620 of the acts of 1908, shall be punished by a fine of not more than one thousand dollars or imprisonment of not more than one year or by both such fine and imprisonment."

The changes from the original bill are the insertion of the word "wilfully" and the provision in regard to chapter 620.

Representative Barnes has redrafted his grade crossing bill which was defeated in the Senate by a tie vote. The new section provides that the road shall eliminate one crossing each year for every hundred miles of roadbed.

Missouri.—The so-called full crew bill pending in the Missouri Legislature, which provides for additional brakemen on freight and passenger trains, is absorbing the interest of many railroad officials. A similar bill has been introduced in the States of Kansas, Texas, and Oklahoma. In Kansas it was killed on adverse report of the Senate; it failed to pass the House in the Texas Legislature, which, under the constitution of that State, kills it, and it has not passed either house of the Oklahoma Legislature.

A law requiring all railroads doing business in Missouri to incorporate under the laws of that State, has been passed by the House of Representatives. The purpose of the proposed law, is to make it possible for persons to sue the

Digitized by Google

railroads in the State Court. Governor Major has signed the Public Utilities Bill, which creates a State board of five members to regulate the rates and service of all public utilities corporations in Missouri. The law is modeled after the New York law.

Provision is made for a court appeal from decisions of the Commission, but a clause in the bill provides for the speedy advancement of such cases on court dockets.

New Jersey.—With the passage signature of Governor Fielder to the Grade Crossing Bill, the railroads operating New Jersey are confronted with a condition against which they fought with great energy. This bill, which is now a law, and which is discussed more fully in another section, enables the utilities commission to provide for the abolition of all grade crossings and to fix the entire expense of the work on the railroads except in the event of a trolley crossing and the relaying of municipal water and sewer pipes. A number of towns, notably the Oranges, have refused to negotiate with the railroads except on that basis.

Oklahoma.—Governor Cruce, of Oklahoma, has vetoed the 2½ cent passenger rate bill, which had passed the legislature. The present passenger rate in Oklahoma is 3 cents, and the bill was vigorously opposed by the railroads in that State. Railroads consider the veto will greatly stimulate the growth of Oklahoma.

Later an effort was made to pass this bill over the Governor's veto, and failed. By a vote of 31 to 10, however, the Senate passed over the Governor's veto, the bill requiring railroads operating within the State to maintain hospital facilities within the State.

Rhode Island.—An act, submitted to the electors by a special election, the Chamberlain proposition, whereby the State is asked to guarantee $6,000,000 Southern New England Railway bonds, has been introduced in the House.

After providing for submission to the electors for a vote on the matter the act reads:

"Shall the General Assembly be authorized and directed to provide for a guarantee on the part of the State of the principal and interest of the $6,000,000 bonds of a corporation to be formed by the consolidation of the Southern New England Railway Co., and the Southern New England Railroad, said guarantee to be second to that of the Central Vermont Railway Company, of Vermont. The proceeds from the sale of said bonds to be applied to the completion of the railroad of said corporation from Providence."

Texas.—By a vote of 22 to 6, the Senate has passed over Governor Colquitt's veto the Missouri, Kansas and Texas Railroad Consolidation Bill, which would allow that road to merge under one management the Missouri, Kansas and Texas Railroad of Texas, the Wichita Falls and Northwestern, the Wichita Falls and Southern, the Texas Central and the Beaumont and Great Northern Railroads.

Though the three last-named lines are subsidiaries of the Missouri, Kansas and Texas, they have maintained separate offices under Texas charters.

The House had already passed the bill over the Governor's veto.

The Farmers' Union of Texas, through its officials and representatives, has sent an address in opposition to the full crew bill to all the members of the thirty-third Texas Legislature. In part the address says: "The Farmers of Texas respectfully ask you not to place any additional burden on the producers of this State. Our burdens are heavy enough already.

"For the above reason we are opposed to the Full Crew Bill now pending that will compel the railroads to employ additional men on their trains, thereby increasing the cost of operation—which we in the end pay—about $1,000,000 a year."

Vermont.—Two bills which would give the Boston & Maine Railroad permission to construct two connecting links to complete its system down the Connecticut River Valley to Massachusetts, parallel with the Central Vermont, a Grand Trunk subsidiary, have been passed upon favorably in the Legislature. Counsel for the road said, however, that the connecting links would not be built so long as the present agreement between the Grand Trunk and the Boston & Maine for the joint use of the existing tracks remained in effect. The agreement might be abrogated by either company, according to the counsel, when the arrangement should be found unsatisfactory.

West Virginia.—An act of the Legislature designed to preserve competition among railroads, has been signed by Governor Glascott.

The act prohibits any director, officer, agent, representative or attorney of any railroad company doing business in this State from acting or serving as president, vice-president, director or general executive officer of any kind of any railroad company owning or controlling or interested in any parallel or competing line. It also prohibits any railroad from consolidating its stock or franchise with that of any other parallel or competing railroad company.

Railroad companies are given until July 1, 1913, to divest themselves of any ownership of capital stock or equitable interest in any shares of the capital stock of another railroad or a competing or parallel line of railroad.

Fine and imprisonment are provided for violations, and Criminal and Circuit Courts of all counties are given jurisdiction.

LABOR.

The Month's Developments.—Railway labor developments for the past month were of a decidedly menacing character, and the opinion has developed among officials that they constitute one of the gravest immediate problems of railway management. In various sections of the country demands for increased pay and improved conditions are being made or are in the course of preparation and a climax is rapidly approaching which will leave railway managers no other alternative in many cases, than to flatly refuse such demands. This was recently pointed out in a significant manner by Mr. Elisha Lee who is chairman of the Conference Committee of Managers, representing the fifty-four railroads in the Eastern territory, which, a few weeks ago, submitted the Fireman's Wage Controversy to arbitration under the Erdman Act. Mr. Lee's statement made before the Arbitra-

Digitized by Google

tion Committee, and which is referred to at greater length in another section, clearly indicates that the railroads have reached a point where they now feel it is their duty to the public and their shareholders to resist demands which they believe extravagant; and, it is further intimated that such demands have now unquestionably reached this point.

Under the circumstances, the necessity for some adequate governmental regulation, under which such disputes shall be arbitrated, is becoming daily more apparent. The Erdman Act is entirely inadequate to meet the situation and furthermore, can only be applied with the consent of all parties concerned. The Railway Business Association, ever on the alert to promote and conserve in a legitimate way, the proper operation and development of the Nation's railways, has recently issued a bulletin which portrays in a striking manner, the National menace of railway strikes as evidenced by recent developments in the attitude of railway labor.

The Railway Business Association declares the situation so grave that Congress should at once take some adequate action which would reassure business. It is pointed out that one of the acute present causes of business anxiety is the fear, that through the failure of the Federal Erdman Act, arbitration of railway labor disputes may break down and perhaps plunge the whole country into the chaos and destruction of a strike. It is suggested that Congress, at the extra session, should make arbitration procedure so acceptable to employees and railway managers that an adjustment of disputes will be assured without inflicting interruption of train service upon millions of neutrals. It asserts that the Erdman Act should be amended forthwith or legislation substituted for it providing for a form of voluntary arbitration so little open to valid objection as to deprive the disputants of all reasonable excuse for declining arbitration under the law.

It is suggested that railway managers, railway employees and the public should co-operate to obtain legislation which will place them squarely on the side of industrial peace and public convenience and accomplish some progress in the direction of equity for all concerned in the settlement of wage disputes.

In the meantime the demands of railway labor go merrily on. The railways, giving employment to hundreds of thousands of hands, bound by Federal, State and local laws and regulations, paying heavy taxes and distributing millions in compensation, are being placed more and more at the mercy of irresponsible labor organizations, who, at the present time, are not subject to either Federal or State interference unless property has been actually destroyed or blood shed.

At Chicago, a recent vote of switchmen, who are employed by the nineteen important railroads operating in and out of that great metropolis, overwhelmingly indicated that the men were ready to resort to the objectionable methods of a railway strike unless their demands for higher wages were agreed to. Later developments, however, found them willing to arbitrate under the Erdman Act and at the present writing Commissioner Hanger, of the Bureau of Labor, is in Chicago attempting to adjust the differences.

In the East, railway trainmen appear to be generally preparing to make a demand on their employers for higher wages and changes in working conditions, and the leaders of the Brotherhood are urging members to induce all eligible employees to unite with the organization. Intimations are being made frankly by Eastern railroads, however, that until the issue with the firemen is determined, they will consider nothing in behalf of any other oganized body of employees.

In New England, between 250 and 300 men, members of the Electrical Workers' Association, and employed in the electrification and construction work of the New Haven road between Sanford and New Haven, have struck for higher wages. Officials of the road state that the demands will not be granted and that their positions will be filled as rapidly as possible.

As the result of a series of conferences between the representatives of the Illinois Central Railroad and officials of the Railway Telegraphers, more than one thousand telegraphers in the employ of that road have obtained a new contract providing for an increase in pay. There have been small strikes in various sections of the country and unimportant wage adjustments.

Predictions are being made, that owing to the many improvements which will be required during the coming season and on account of the unusually heavy demand for railway labor in Canada, there will be a shortage of labor for maintenance of way work during the current year as serious as that which existed during the season of 1912. Preparations are being made on many lines to begin work as early in the spring as possible. On a number of railroads material is now being assembled and distributed and bunk cars prepared for the use of employees.

NEW ROADS.

Canada.—Advices from Ottawa say that parliamentary sanction has been obtained for the incorporation of the Calgary, Edmonton & Fort McMurray Railroad Company, with a capital of $10,000,000. The company proposes to construct a line from Calgary to Edmonton and then to Fort McMurray, Chipewyn, and on to the Great Slave Lake, also two branch lines.

Oklahoma.—The Oklahoma Northern Railroad Company has been chartered with $50,000 capital, to build a line from Vinita, Ok., to Cofeyville, Kan., a distance of forty-two miles, at an estimated cost of $35,000 per mile. The promoters of the new line are: A. King, H. L. Steen and G. D. Meiklejohn, all of Omaha, Neb.; W. F. Snodgrass and J. W. Tolliver, both of Centralia, Ok. Under the terms of its charter the road is allowed to use either steam or electricity for its motive power.

Reports from Guthrie state that the Mountain Valley and Plains Railroad, chartered with $500,000 capital in February, 1909, and promoted at that time, is now to be built. The securities have been sold and construction will begin in the near future. The road was chartered to build eastward from Cimarron, N. M., through Higgins, Clarendon and Dalhart, Tex., to Guthrie, passing through the Oklahoma towns of Taloga, Arnett, Watonga and Kingfisher.

Texas.—Arrangements are being made for the construction of a railroad from Teague to Paris, Texas, via Bristol, Alsdorf and Telico. The pro-

Digitized by Google

posed line will connect with the Trinity & Brazos Valley at Teague and with the Houston & Texas Central at Paris. It will be about eighty miles long.

Reports from Fort Worth state that a railroad is to be constructed from Knox City, on the Orient Railroad, to Crystal Falls and ultimately to this city. The new line is to traverse the northern part of Stephens County, in which, it is said, there is an undeveloped coal field.

West Virginia.—A charter has been granted by the Secretary of State to the Williamsport, Nessle & Martinsburg Railway Company, with principal offices in Martinsburg, and capitalized at $250,000. The company plans to construct a railroad between Williamsport, Md., and Martinsburg.

ELECTIONS AND APPOINTMENTS.

A Correction.

In the March issue of the "Railway World," it was stated that Mr. L. E. Johnson, President of the Norfolk and Western Railway, had resigned. This was a mis-statement of fact, and the result of a false report, utterly without foundation. It is a matter of sincere regret to the management of the "Railway World" that it should have occurred.

Executive.

M. C. Beyers, assistant to president, Great Northern Railway. Headquarters, St. Paul, Minn.

Wilbur C. Fisk, president, Hudson & Manhattan Railroad. Headquarters, New York.

John H. Hunter, vice-president, Brinson Railway. Headquarters, Savannah, Ga.

William G. Phelps, assistant purchasing agent, Pennsylvania Lines. Headquarters, Pittsburgh, Pa.

Miscellaneous.

George K. Andrews, commissioner of agriculture, with supervision over the lines of Missouri Pacific. Headquarters, St. Louis, Mo.

Dr. J. E. Becknell, medical examiner, Western Division, Pennsylvania Lines. Headquarters, Fort Wayne, Ind.

Prof. E. R. Bennett, horticulturist, Rock Island Lines.

W. E. Birch, field agent, department farm improvement work, Southern Railway. Headquarters, Asheville, N. C.

Ashleigh P. Boles, horticulturist commissioner, the Frisco. Headquarters, Springfield, Ohio.

S. M. Byars, field agent, department farm improvement work, Southern Railway. Headquarters, Asheville, N. C.

Edgar E. Clark, chairman, Interstate Commerce Commission.

W. B. Crabtree, chief special agent, Nashville, Chattanooga and St. Louis. Headquarters, Nashville.

Clyde C. Dibble, general storekeeper, Cleveland, Cincinnati, Chicago & St. Louis Ry., the Peoria & Eastern Ry., and the Cincinnati Northern Railroad. Headquarters, Beech Grove, Ind.

Marcus A. Dow, general safety agent, New York Central Lines.

W. L. English, superintendent of agriculture, the Frisco.

Louis J. Folse, Jr., assistant commissioner of freight and transportation, New Orleans Board of Trade.

W. M. Fryar, special agent, Nashville, Chattanooga and St. Louis.

U. K. Hall, general storekeeper, Oregon-Washington Railroad and Navigation Company. Headquarters, Portland, Oregon.

George A. Hawkes, representative, Southern Pacific Company. Headquarters, Salt Lake City.

Alfred H. Holmead, assistant secretary, Interstate Commerce Commission.

Myer Hurley, member, Public Utilities Commission of Kansas.

S. E. Keillor, storekeeper, Duluth, Winnipeg & Pacific. Headquarters, Duluth.

Andrew R. Lewis, custodian, Indianapolis Union Railway.

Clarence H. Lodge, advertising agent, Gulf, Colorado and Santa Fe Railway. Headquarters, Galveston, Texas.

T. J. Love, fuel agent, Canadian Northern and Duluth, Winnipeg & Pacific. Headquarters, Winnipeg, Man.

George B. McGinty, secretary, Interstate Commerce Commission.

Frank T. Magan, representative, Nickel Plate and D. L. & W. Railroads. Headquarters, Chicago.

L. A. Markham, commissioner of agriculture, St. Louis, Iron Mountain & Southern. Headquarters, Little Rock, Ark.

Allan Pollak, superintendent of dining cars, hotels and restaurants, Pacific System, Southern Pacific. Headquarters, San Francisco, Cal.

R. L. Sliger, advertising agent, Southern Pacific. Headquarters, New Orleans.

J. F. Stewart, inspector of efficiency, Pittsburgh Division, Pennsylvania Railroad.

G. S. Ward, chief special agent, Seaboard Air Line Railway. Headquarters, Norfolk, Va.

J. S. Webster, chief special agent, Southern Pacific Lines.

F. S. White, special agent, Frisco. Headquarters, Springfield, Mo.

RESIGNATIONS.

Executive.

Roger Campbell, director, Galveston, Houston and Henderson Railroad.

George J. Gould, director, Galveston, Houston and Henderson Railroad.

William G. McAdoo, president and director, Hudson and Manhattan Railroad.

Henry F. Shoemaker, director, Cincinnati, Hamilton & Dayton Railway.

Financial.

Henry L. Gray, chief engineer, Public Service Commission, State of Washington.

J. M. Jones, treasurer for receivers, Kansas City, Mexico & Orient Ry.

D. J. Kerr, secretary and treasurer, Houston & Brazos Valley Railroad.

Alexander Millar, secretary, Pacific Mail Steamship Company.

Engineering and Mechanical.

Weber H. Arkenburgh, general signal inspector, Chicago, Rock Island & Pacific.

Digitized by Google

M. C. Byers, chief engineer, operation, St. Louis and San Francisco Railroad Company.

A. B. Chadwick, in charge of shops, Armour Car Lines.

J. H. Clark, signal inspector, Louisville & Nashville and the Nashville, Chattanooga & St. Louis.

C. A. Dunham, signal engineer, Grand Trunk Railway.

H. A. Gardiner, electrical engineer, Chicago, Burlington & Quincy Railroad.

E. S. Heyser, trainmaster and roadmaster, St. Louis, Brownsville & Mexico.

Walter H. Lienesch, consulting engineer, Illinois Traction System.

Abram Lucas, general foreman, locomotive department, Chicago, Milwaukee & St. Paul.

W. T. Main, division engineer, Chicago & Northwestern Railway.

Y. M. Martin, trainmaster, Missouri, Kansas & Texas Railway of Texas.

John R. Rison, Jr., trainmaster, New Orleans Division, Yazoo & Mississippi Valley.

J. W. Small, assistant general manager (mechanical), Galveston, Harrisburg & San Antonio, the Houston & Texas Central, the Houston East & West Texas, the Houston & Shreveport, and the Texas & New Orleans.

F. W. Smith, construction engineer, Cleveland, Chicago & St. Louis Ry., and the Peoria & Eastern Railway.

A. Syverson, trainmaster, East Iowa Division, Chicago & North Western.

Watson Townsend, assistant engineer, Union Pacific.

H. C. Van Buskirk, master mechanic, Atchison, Topeka & Santa Fe.

F. B. Walker, resident engineer at St. Paul, Great Northern.

Operation.

L. Acker, roadmaster, Houston & Texas Central.

J. W. Anderson, assistant superintendent, Oregon-Washington Railroad & Navigation Company.

F. R. Blount, superintendent, the Katy.

L. A. Boyd, general manager, Augusta Northern.

R. A. Crofton, assistant superintendent, Houston & Texas Central, Houston East & West Texas, and Houston & Shreveport.

George Geiger, superintendent, Copper River & Northwestern.

H. G. Harden, assistant superintendent, Louisiana Lines, Southern Pacific.

J. F. Hickey, superintendent, McAlester District, Missouri, Kansas & Texas.

W. M. Hobbs, general superintendent, Morgan's Louisiana & Texas Line.

C. W. Houston, superintendent, Duluth, Winnipeg & Pacific.

J. V. McCullough, soliciting agent, Louisville & Nashville.

J. E. McLean, assistant superintendent, Galveston, Harrisburg & San Antonio.

E. L. Martin, assistant superintendent, Louisiana Western Railroad and Morgan's Louisiana & Texas Railroad & Steamship Company.

J. W. Moore, roadmaster, Morgan's Louisiana & Texas Railroad and Steamship Company.

T. L. Morse, superintendent, Direct Navigation Company.

J. C. Muir, superintendent, Chicago Division, Chicago & Eastern Illinois Railroad.

A. B. Newell, general manager, Tennessee Central Railroad.

P. G. Richelson, station master, Baltimore & Ohio.

J. F. Sanders, assistant superintendent, Louisiana Lines, Southern Pacific.

R. W. Scott, superintendent, Montreal terminals, Grand Trunk.

J. M. Shea, general superintendent, Seaboard Air Line.

J. W. Small, assistant general manager in charge of motive power, Southern Pacific Lines.

Traffic.

L. F. Barron, local freight agent, Illinois Central.

W. W. Breedlove, general agent, A. B. & A.

H. B. Bryning, traveling immigration agent, Northern Pacific.

W. B. Butler, soliciting freight agent, Georgia Southern & Florida.

A. C. Carper, traveling freight agent, Frisco.

T. J. Crossan, agent, Lehigh Valley Railroad.

F. M. Curry, commercial agent, Missouri Pacific-Iron Mountain Railway.

J. E. Davenport, division passenger agent, Louisville & Nashville.

M. H. Dorsett, commercial agent, Macon, Dublin & Savannah.

R. H. Dozier, commercial agent, Georgia, Florida & Alabama.

A. E. Duff, division passenger agent, Grand Trunk Railway.

Earl Z. Giblon, traveling passenger agent, Union Pacific System.

J. J. Glasford, agent, Lehigh Valley Railroad.

John F. Harvey, commercial agent, Central Savannah.

W. T. Holley, traveling passenger agent, Union Pacific.

R. D. T. Hollowell, commercial agent, C. C. & O. Ry.

C. J. Jones, traffic manager, Copper River and Northwestern Railway Company and Alaska Steamship Company.

E. C. Jones, commercial agent, Louisville, Henderson & St. Louis.

Harvey E. Jones, assistant general passenger agent, Southern Railway.

Lyon Liston, traveling freight agent, Union Pacific System.

J. V. McCullough, soliciting agent, Louisville and Nashville Railroad Company.

L. F. McFarland, district passenger agent, Chicago Great Western.

J. M. Mauden, traveling passenger agent, Chicago & Alton.

W. J. Pfeil, agent, Lehigh Valley Railroad.

R. M. Pyle, assistant general passenger agent, Pennsylvania Railroad.

S. C. Sigler, traveling freight agent, Union Pacific System.

C. D. Smith, general live stock agent, International & Great Northern and Texas Pacific Railway.

A. H. Swanson, city passenger agent, M. K. & T.

C. E. Trust, soliciting freight agent, Missouri & North Arkansas Railway.

Industrial.

F. A. Moore, agent of land and industrial department, Southern Railway.

Purchasing.

A. E. Douglas, purchasing agent and storekeeper, Rutland Railroad.

J. L. White, assistant purchasing agent, South Texas and Louisiana Lines.

Miscellaneous.

George Bradshaw, general safety agent, New York Central Lines.

J. E. Mahaney, general storekeeper, Oregon-Washington Railroad and Navigation Company.

D. Urquhart, superintendent, dining cars, hotels and restaurants, Pacific System of Southern Pacific.

OBITUARY.

Alton Augier, formerly general passenger agent of the W. & A. at Atlanta, Ga., and since then in the government service, died recently at his home, Washington, D. C.

Milton H. Brame, civil engineer of the M. K. & T., died February 26th at the Baptist Sanitarium, at New Orleans.

Albert S. Brandeis, general solicitor of the Louisville & Nashville R. R., died at his home in Louisville, Ky., March 4th, at the age of 54.

Otto Brendler, trainmaster of the Chicago Milwaukee & St. Paul Railway, at Green Bay, Wis., died February 28th, at the age of 51.

John J. Cairns, passenger agent of the Chicago, Milwaukee & St. Paul at Chicago, died in that city on February 18th, as result of injuries received when he was struck by a train on the Northwestern Elevated Railroad the evening before. Mr. Cairns was 60 years old.

John W. Crissey, assistant engineer of construction of the Lake Shore & Michigan Southern, with headquarters at Cleveland, Ohio, died on March 7th, at Chicago. Until a month ago, Mr. Crissey had been resident engineer of the Lake Shore at Chicago, when he went to Cleveland to take charge of track elevation work.

Edward H. Eden, for twenty years identified with the Delaware, Lackawanna & Western Railroad in the northwest and for twelve years commercial agent, with headquarters in Minneapolis, died at Minneapolis the 10th, aged 43 years.

L. B. Fallansbee, supervisor for the Illinois and Iowa demurrage bureau, died at his home in Peoria. Mr. Fallansbee was regarded as an authority on demurrage matters.

Urias J. Fry, 65 years old, superintendent of telegraph, C., M. & St. P., died in Milwaukee, Wis., February 22d. Mr. Fry was well known in the telegraph field and served one term as president of the Old Time Telegraphers' Historical Association. He had been with the C., M. & St. P. since 1874.

J. E. Jenkins, city ticket agent of the Burlington Route, and well known throughout Pacific Coast railroad circles, died in Los Angeles, February 27th.

C. I. Kerr, trainmaster of the Chicago, Rock Island & Pacific, with headquarters at Herington, Kan., died suddenly on March 5th, at Topeka, Kan.

Robert Law, formerly for many years connected with the Burlington system, and afterwards vice-president and general manager of the Colorado & Northwestern, died on February 7th, at Los Angeles, Cal., aged 61 years.

Superintendent J. Lassiter, of the Southern Railroad, headquarters Selma, Ala., died at Meridian, Miss., February 27th in his private car. He was fifty-three years old and was superintendent of the Southern Railroad between Meridian and Selma.

William Riley McKeen, who was president of the Terre Haute & Indianapolis, now the Vandalia, from 1867 to January 15, 1896, died at Terre Haute, Ind., on February 18th. Mr. McKeen was born on October 12, 1829, in Vigo County, Ind. He was the father of Benjamin McKeen, general manager of the Pennsylvania Lines west of Pittsburgh, and of W. R. McKeen, Jr., consulting engineer of motor cars on the Union Pacific.

Arthur W. Moss, division superintendent of the Pennsylvania Railroad, at Reading, Pa., died suddenly March 12th. Mr. Moss was born at Philadelphia, Pa., May 4, 1859. He was educated at Germantown Academy and Phillips Academy and entered railway service as an apprentice in the Altoona shops of the Pennsylvania, December, 1877. Since that time he has served consecutively as draftsman, assistant road foreman of engines, trainmaster and division superintendent. From January, 1893, to January, 1899, Mr. Moss was superintendent of the Frederick Division at York, Pa., and then became superintendent of the Schuylkill Division at Reading.

John R. Price, pioneer railway builder, died at his home, Turon, Kan., aged 85. He was the builder of a large portion of the Santa Fe system, including the A. & P. line through New Mexico and Arizona, the Gulf Line from Arkansas City, through Oklahoma to the Texas Line; 60 miles of the main line to Chicago, and several branches in Kansas. Mr. Price also constructed considerable portions of the Iowa Central, Chicago & Alton, and St. Louis & Omaha Railways. His firm built the Rock Island into Colorado Springs, constructed portions of the Colorado Midland, and built the carriage road to the top of Pike's Peak.

One of the largest railway contracts held by Mr. Price during his busy life was the construction of a railroad from San Luis Potosi to Tampico, Mexico, for the Mexican Central, and another from Venandito to Tampico.

James McCrea.

JAMES McCREA, who until January 1st, had been president of the Pennsylvania Railroad for six years, died at his home in Ardmore, Pa., on the evening of March 28th. He was sixty-five years old.

Mr. McCrea was a graduate of the University of Pennsylvania, and the Pennsylvania Polytechnic College, where he acquired his education in civil engineering. He entered the employ of the Pennsylvania Railroad Company in June, 1865, as rodman and assistant engineer of the Connellsville and Southern Pennsylvania Railroad, in which position he served until December, 1867, when he became rodman on the construction of the Wilmington and Reading Railroad. In September, 1868, he was engaged as assistant engineer on the Allegheny Valley Railroad where he remained until March, 1871.

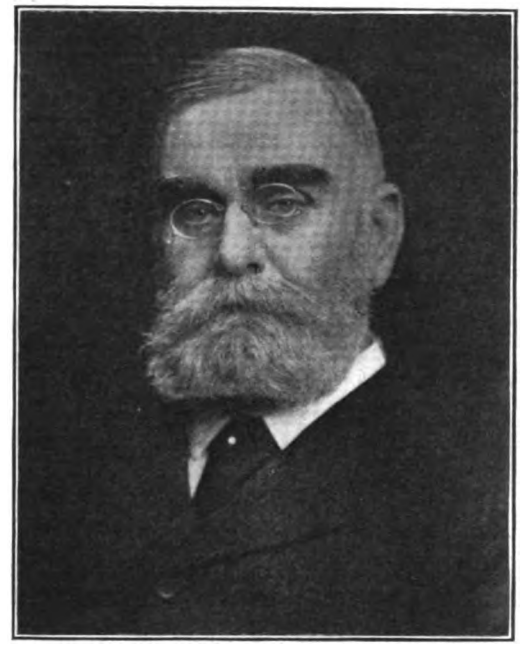
Upon that date he entered the service of the Pennsylvania Railroad as principal assistant engineer in the construction department.

From that time on his career is marked with a succession of dates that indicate his rapid advancement through all the intermediate positions from the lowest to the highest in the Company's service. On August 1, 1874, Mr. McCrea was transferred to the position of assistant engineer of maintenance of way of the Philadelphia Division, becoming superintendent of the middle division on January 1, 1875, and assuming the important position of superintendent of the New York Division on October 15, 1878.

Mr. McCrea began life-long connection with the Western Lines of the Pennsylvania System as manager of the Southwest system, with headquarters at Columbus, O., May 1, 1882. He was advanced to the post of general manager of all the Pennsylvania Lines west of Pittsburgh, October 10, 1885. He then became fourth vice-president on October 19, 1887; second vice-president, March 1, 1890, and first vice-president, April 23, 1891.

For sixteen years Mr. McCrea held this position and maintained a close supervision of all the problems of transportation, engineering, finance and traffic. The marked development of the lines west of Pittsburgh attested his wonderful energy. Upon the election of A. J. Cassatt as president of the company, June 9, 1899, Mr. McCrea was elected director of the Pennsylvania Railroad Company, and on January 2, 1907, upon the death of Mr. Cassatt, Mr. McCrea became president of the Pennsylvania Railroad Company. Shortly after assuming the presidency, Mr. McCrea was elected president of the Philadelphia, Baltimore and Washington Railroad Company, the Northern Central Railroad Company, the West Jersey and Seashore Railroad Company, and the Pittsburgh, Cincinnati, Chicago and St. Louis Railroad Company.

James McCrea was essentially a self-made man. Starting at the very bottom he soon displayed those incomparable qualities that stamped him the great man that he was. Taking up the vast work that the great A. J. Cassatt had left only partially completed, and with a vast number of contemplated improvements calling for an enormous amount of capital, Mr. McCrea ably carried on the work. With his resignation effective January 1, 1913, he stepped out of office after a railroad service of forty years.



JAMES McCREA.

William Randall, auditor of freight and ticket accounts of the Chicago, Burlington & Quincy, with headquarters at Omaha, Neb., died in that city on February 7th, at the age of 71 years. Mr. Randall had been in the service of the Burlington system since 1872, and had been auditor of freight and ticket accounts since 1875.

Charner T. Scaife, chief claim agent of the Illinois Central Railroad, died March 10th. Mr. Scaife was born at Columbia, S. C., February 1, 1855.

William Singer, Jr., for years land attorney for the Southern Pacific, died in San Francisco, February 12th. He was born in St. Louis, October 5, 1850, and in 1852 his parents emigrated and settled in Marysville, Cal. Thirty-five years ago he joined the railroad company's staff.

Robert Bicknell Seymour, formerly chief engineer of the Chicago, Indiana & Southern, died at his home in Oak Park, Chicago, on February 23d, at the age of 53 years.

William N. D. Winne, comptroller of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, died on February 24th, in Florida. He was born October 11, 1850, at Schenectady, N. Y., and was educated in the public schools of his native town and at Madison, Wis., and in private schools at Milwaukee. He began railway work in 1863 as junior clerk in the auditor's office of the Milwaukee & Prairie du Chien and continued with that road until its absorption by the Chicago, Milwaukee & St. Paul. From September, 1882, to September, 1890, he was assistant general auditor of the Chicago, Milwaukee & St. Paul. He became general auditor in 1890, and was appointed comptroller in July, 1910.

STATE COMMISSIONS.

Alabama.—The Railroad Commission ordered the Louisville and Nashville Railroad to restore the two and one-half cent passenger rate in Alabama on March 6th. Announcement has been made by the Louisville and Nashville that it will not abide by the order of the Commission and that the case will be carried to the Federal Court. It is further intimated that the railway will take the matter to the Supreme Court of the United States before making the concession.

California.—The California Commission has decided that if the Union Southern and Central Pacific Railroads make any trackage agreement or lease, they must grant equal rights to any other trans-continental road entering California. This means that the Benicia cut-off, the terminals of San Francisco Bay and the industry tracks may be used by the Western Pacific or by any new trans-continental roads that may enter the State.

The Commission has issued a rule to the effect that the order relating to the posting of tariffs at stations will not apply to tariff publications confined to information as to the numbers, dimensions and capacities of freight cars, except that such publication shall be placed on file by carriers at points where complete files of tariff publications are kept

Maryland.—The Public Service Commission has granted permission to the Western Maryland Railway Terminal Company to issue $300,000 in stock under the terms of its charter granted by the Legislature in 1882. In its order of approval, the Commission stipulates that reports must be made semi-annually as to the sale of the stock and disposition of the proceeds.

The Public Service Commission has passed an order approving the proposed issue of the twenty-year four and one-half per cent convertible gold bonds of the Baltimore and Ohio. This compromise has been arrived at by the Baltimore and Ohio agreeing to accept this order subject to the decision of the Upper Court, as to whether the Commission has authority to pass on such issues. The railroad claims it is exempt from such authority under its charter rights and this claim has been preliminarily upheld by the lower Courts.

Massachusetts.—A sub-committee of the Joint Committee on Railroads of the State Legislature has submitted a bill to the full Committee designed "to change the name, enlarge the membership and increase the power of the railroad commissioners." Proposed draft increases commissioners from three to five, raises their salaries and gives them supervision over telephone and telegraph companies now resting with the highway commission.

Illinois.—Figures recently published by the State Railway Commission, show that the total number of persons injured during the year on the railroads of the State, was 13,593, an increase of 1,729 over the previous year. Of this number 1,095 were injured on the surface and electric lines and 12,498 on the steam roads. The number killed during the year was 900 on both steam and electric lines. This represents a decrease of 46 as compared with the previous year.

Ohio.—For the purpose of paying outstanding indebtedness, making improvements and purchasing new rolling stock the Public Service Commission has granted authority to the Big Four Railroad to issue $7,000,000 of four per cent bonds.

New York.—The up-State Public Service Commission has opened correspondence with various railroad companies in the State in an effort to have such companies supply suitable individual drinking cups on its trains.

Approval has been given by the Commission to the New York Central & Hudson River Railroad Company to consolidate the following companies: Spuyten Duyvil & Port Morris, Gouverneur & Oswegatchie, New York and Putnam, Tivoli Hollow, Buffalo, Erie Basin and New York Central, Niagara River Railroad Companies, Mohawk & Malone, Carthage and Adirondack, and New York & Ottawa Railway Companies and the Tonawanda Island Bridge Company.

The Commission has refused the application of the New York Central and the New York, New Haven & Hartford Railroad for rehearing on the recent order reducing commutation rates between New York City and points in Westchester County

Pennsylvania.—The State Commission has appointed an expert accountant to make a searching examination of the books and records of the Pennsylvania Railroad and the Philadelphia and Reading for the purpose of finding out the cost to the carrier of the transportation of anthracite coal from the mines to Philadelphia. The appointment of the accountant has met with the approval of these roads and he will be given all the assistance necessary to procure the facts.

The Commission has approved the recommendation of its marshal, that rule No. 24 on the Lehigh Valley Railroad ought to be revised so that a light shall be displayed on the dead end of trains when it is necessary to shift cars by night over a public crossing.

Texas.—The Railway Commission has issued an order directing every railroad operating in Texas to file with the Commission a detailed statement showing expenditures for additions and betterments made upon and to the benefit of such railroad property since the date of original valuation; such statement to show the expenditures for each fiscal year ending June 30th, including the last fiscal year. The statement must be made and filed with the Commission within the next thirty days.

The Commission will give a public hearing on April 8th on the proposition of revising the demurrage rules. A number of changes are proposed, and if adopted they will affect shippers and the railroads in the Southwest in several important particulars.

LEGAL.

Suits Under the Federal Law.—Rumors are current that the Federal Government plans to institute several thousand suits against various railroads for alleged violation of the sixteen-hour law. Whether this be true or not, the astonishing large number of fines to which the railroads have recently been subjected and the suits

Digitized by Google

which are now pending, indicate that many important roads are either lax in their efforts to comply with the federal statutes or else are finding it a practical impossibility to do so. Fines pending or imposed during the past few weeks run well up into the hundreds of thousands and include convictions for rebating, violation of the hours of service law, and the safety appliance law. With one branch of the service painstakingly explaining to railroad employes how many tons of freight can be moved a mile by employing more carefully the stubs of lead pencils and putting in operation other saving methods, it appears rather incongruous that the railroads should be regularly paying out thousands of dollars to the Federal Government for the non-adherence to the statutes. Unquestionably, many of these laws inflict a real hardship and cause an extra expense which is not justified by operating conditions. It would, however, appear a cheaper and wiser course to pursue, to make every effort to comply with them.

Recent Supreme Court Rulings.—The Supreme Court has recently issued a number of rulings of interest to railway officials.

In accordance with the principle that Federal law rather than State law, controls contracts for the shipment of goods from State to State, as announced recently in an express rate case, this Court has decided that railroads carrying household goods from one State to another may make valid contracts to limit their liability in cases of loss or damage.

The Court also decided in another case that the roads may require in bills of lading that suits for loss or damages be brought within ninety days. In the former case Arkansas Courts were overruled and the latter upset the Texas decisions.

The Supreme Court has granted the request of the Government to review the decision of the Federal Courts in New York in the street railway cases, to decide if corporations in the hands of receivers are required to pay the corporation tax.

Other cases decided are as follows:

Holding unconstitutional, as interfering with interstate commerce the Arkansas statute of 1907, requiring railroads to give notice of the arrival of a shipment.

Directing the dismissal of the suit of the St. Louis, Iron Mountain and Southern Railway Company attacking the validity of the Barker Act of Arkansas, which required the furnishing of cars upon request of shippers.

The contest between the Northern Pacific Railroad Company and the United States over validity of patents to the railway company on lands claimed by the Government to have been included within the Yakima Indian Reservation in Washington was decided by the Court in favor of the Government.

The claim of the Union Pacific Railroad Company that Congress had granted it a right of way 400 feet wide from the middle of the State of Nebraska to Denver, Col., and that it had not lost it by fencing in a narrower width has been upheld.

In the case involving the death of a clerk of the railway mail service, it is held, irrespective of the Hepburn rate law, that a person accepting gratuitous transportation is still under the protection of the State law, against injury or death by negligence.

The Supreme Court has taken a recess until April 7th, without announcing its decision in the State rate cases.

Commerce Court Decisions.—The Commerce Court has handed down a ruling affirming the decision of the Interstate Commerce Commission in the California lemon rate case. By this decision the rate on lemons from California points to Eastern markets is to be reduced from $1.15 to $1 per 100 pounds. This is the second time this case has been taken to Court. The first order of the Commission in the lemon rate case was nullified by the Commerce Court.

The Commerce Court has handed down an order dismissing the motion of the Interstate Commerce Commission to dismiss the petition of the lumber tap lines in the Southwest. The Court held that it has jurisdiction over the decision of the Commission and that it will proceed with the case. It is noted that this action of the Court does not prejudice the case. This noted case has been the cause of more trouble to the Commission than any for a number of years.

The preliminary injunction granted by the Commerce Court against the Interstate Commerce Commission in the so-called pipe line cases, has not been accepted by that body and an appeal through the Department of Justice has been made to the United States Supreme Court. The Government will ask that the case be advanced for hearing. The Standard Oil Company is the chief owner of the pipe lines and its contention, as well as that of the smaller companies involved, is that they are not common carriers in that they only carry their own products, and that Congress exceeded its authority when it attempted to make them common carriers. In brief, the provision of the act making pipe lines common carriers is attack on the grounds that it is unconstitutional in that its effect will be to take private property without compensation. The Commission in granting the injunction, did not discuss the constitutionality of the amendment to the Hepburn law, but said that the question was one which would have to be decided by the Courts. The Commerce Court holds that Congress has not the power to compel a private company to become a common carrier.

Lackawanna Files Answer in Commodity Suit.—The Delaware, Lackawanna and Western Railroad Company and the Delaware, Lackawanna and Western Coal Company, have filed in the United States District Court at Trenton, New Jersey, answers denying the allegations of the Government in its suit instituted a month ago charging violations of the "commodities clause" of the Hepburn law, which makes it illegal for railroad companies to transport over its lines for interstate traffic any coal in which it had an interest.

The Government asked for an injunction restraining the defendants from transporting anthracite coal either mined or purchased by the railroad company and sold by the railroad company to the coal company, in pursuance of an agreement entered into August 2, 1909, in which

Digitized by Google

the railroad company, it is alleged, agreed to supply the outputs of its mines to the coal company, which was organized for the purpose of purchasing such coal.

The answers are a general denial of the charges that the agreement between the railroad company and the coal company is in pursuance of any purpose to restrain trade. It is admitted that before the organization of the coal company the railroad company declared a dividend of 50 per cent for the purpose of permitting its stockholders who might wish to do so to invest in the stock of the coal company. It is claimed that the agreement of the railroad company to sell coal to the coal company was made unnecessary by the act of Congress referred to, in order that the railroad company might dispose of the coal produced at its mines, but it denies that the railroad company in any way controls the operation of the coal company.

Traffic.—The railroads were among the heaviest losers from the effects of the disastrous floods which recently swept portions of the States of Ohio and Indiana. Hundredes of miles of roadbed were inundated and destroyed and many bridges and station buildings will have to be entirely reconstructed. A large quantity of rolling stock and freight was also destroyed. What the total loss to the railroads will be is not accurately known at the present time, although estimates place it well up in the millions. Schedules were seriously interfered with and in many instances indefinitely suspended, while the stalling of a large number of trains of live stock and perishable products further complicated the situation. Never in the history of railroading have the carriers sustained a more extended or serious interruption of their service, and it will be several weeks before normal conditions are again reached. Laborers and supplies have been sent to the affected districts and repair work has been started with a rush. At the present writing the railways are exerting every effort in the direction of bringing relief to the thousands who have been left destitute.

The latest reports regarding Parcel Post developments show that the movements for February increased approximately 26 per cent over those of January, and it is reported that 50,000,000 packages were handled through the postal service during that month. Chicago's record was the highest, showing over 5,000,000 packages handled. New York came second with 4,000,000; Boston third with 1,300,000; Cleveland fourth with 1,200 000 and St. Louis fifth with approximately 1,000,000.

Traffic both East and West continued to show satisfactory gains over a year ago and loading reports failed to reflect any important falling off in general business in any particular section. A significant piece of news is contained in the Government's latest report on grain in farmers' hands which shows that on March 1st, there were 2,113,000,000 bushels of the four leading cereals still on hand, compared with only 1,320,000,000 bushels for the corresponding date of last year.

Reports from leading railroad officials are most satisfying as to the outlook, such men as W. C. Brown, president of the New York Central Lines and Howard Elliott, president of the Northern Pacific, having recently expressed the opinion that indications point to a prosperous year. Notwithstanding the fact that the railroads are handling a heavy tonnage, the car service situation remains satisfactory, the net surplus on March 15th, being 38,000 cars as compared with 3,000 cars on March 13th, 1912. The open winter has played an important part in this favorable condition, as the railroads are unquestionably moving a greater tonnage now than they were during the corresponding period of last year. The one class of freight which shows a sharp decline is that of anthracite tonnage, which, for February was some 200,000 tons less than for February of 1912. This is, however, the direct result of the unusually mild weather which has been characteristic of the present winter in many localities.

Imports and exports continue to show remarkable results and a new high record in the history of American foreign commerce was established for February, the aggregate of imports and exports amounting to nearly $344,000,000, with a balance of trade in favor of the United States of approximately $44,500 000.

DIVIDEND NOTICES.

Office of the United Gas Improvement Company,
N. W. Corner Broad and Arch Sts.

Philadelphia, March 12, 1913.

The Directors have this day declared a quarterly dividend of two per cent. ($1.00 per share), payable April 15, 1913, to stockholders of record at the close of business March 31, 1913. Checks will be mailed.

LEWIS LILLIE, Treasurer.

American Car and Foundry Company.

New York, March 3, 1913.

PREFERRED CAPITAL STOCK.

Dividend No. 56.

A dividend of one and three-quarters per cent. (1¾%) on the Preferred Stock of this Company has this day been declared, payable Tuesday, April 1, 1913, to stockholders of record at the close of business Tuesday, March 11, 1913.

Checks will be mailed by the Guaranty Trust Company of New York.

S. S. DE LANO, Treasurer.
WM. M. HAGER, Secretary.

American Car and Foundry Company.

New York, March 3, 1913.

COMMON CAPITAL STOCK.

Dividend No. 42.

A dividend of one-half per cent. (½%) on the Common Stock of this Company has this day been declared, payable Tuesday, April 1, 1913, to stockholders of record at the close of business Tuesday, March 11, 1913.

Checks will be mailed by the Guaranty Trust Company of New York.

S. S. DE LANO, Treasurer.
WM. M. HAGER, Secretary.

ANNUAL MEETING NOTICE.

Southern Pacific Company.
NOTICE OF MEETING.

165 Broadway, New York, N. Y.

The Annual Meeting of the Stockholders of the Southern Pacific Company will be held at the office of the Company in Beechmont, Jefferson County, Kentucky, on Wednesday, April ninth, 1913, at twelve o'clock noon, standard time, for the election of Directors and the transaction of all such other business as may legally come before the meeting, including the approval and ratification of all action of the Board of Directors and of the Executive Committee since the last annual meeting of the stockholders of the Company.

For the purposes of the meeting the books for the transfer of stock will be closed at three o'clock P. M., on Monday, March 10th, 1913, and will be reopened at ten o'clock A. M., April 10th, 1913.

By order of the Board of Directors.

HUGH NEILL, Secretary.

Dated January 31st, 1913.

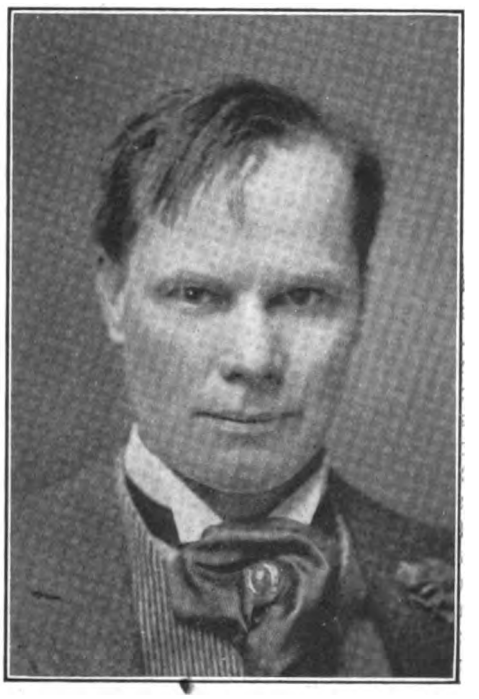
VOL. LVII. MAY, 1913 No. 5

Important Developments in the Transportation Field

THE "FULL CREW" LAWS OF NEW YORK AND NEW JERSEY

On December 11, 1912, the *Wall Street Journal* published extracts from a letter sent out from the headquarters of the Brotherhood of Railroad Trainmen. In this letter Mr. John Fitzgibbons, so-called "legislative representative" of the trainmen, informed the members of his organization that Congressman William Sulzer had given him the following promise: "If I am elected I will sign the Full Crew Bill and I will aid you in securing its passage." This letter was written two days before election. Its authorship has not been denied by the writer, although the Governor of New York has repudiated it. There seems to be no doubt that a pledge of this character was made by somebody representing himself as having authority to bind the candidate and that it was made with a view to influencing railway men's votes for the Democratic candidate.

The Full Crew law passed by the New York Legislature and which the Governor has signed, provides that a freight train of more than 25 cars, running outside of yard limits, and on railroads more than 50 miles in length, must be manned with a crew of not less than one engineer, one fireman, one conductor and three brakemen; any train of five cars or more, other than a freight train, must have one engineer, one fireman, one conductor and two brakemen; and, if it is a passenger or baggage train, it must have a baggage man in addition to the crew. Any freight train of 25 cars or less must have one engineer, one fireman, one conductor and two brakemen; and any light engine must have not less than one engineer, one fireman and one conductor or brakeman. A similar law has been passed by the New Jersey Legislature and signed by Governor Fielder on April 1st.



GOVERNOR WILLIAM SULZER, OF NEW YORK.

GOVERNOR JAMES C. FIELDER, OF NEW JERSEY.

These laws represent the extreme type of interfering legislation. The states of New York and of New Jersey have established Public Service Commissions charged with the duty of supervising the capitalization, the rates, and the service of all public utility corporations within their borders. If the railroads are so unmindful of their own in-

Digitized by Google

terests as to attempt to operate their trains with a number of trainmen insufficient to operate them safely, it is the duty of the Commission, either acting on its own initiative, or on the petition of some interested party, to require them to improve their service. The legislature and the governor are entirely unqualified to pass on matters of railway operation. That they have done so is merely an evidence of an abject surrender on the part of men whose judgment does not approve, we are confident, the course they have taken, to the political power of the railway brotherhood.

This bill was passed and signed in spite of vigorous and general protest on the part of railroad officials, and in spite of an offer made by the executive of every large railroad in the state of New York coming under its provisions, to refer the question to the Public Service Commission, and an agreement to abide by the Commission's decision. The railway presidents further promised the Governor, in case he would veto the bill, that if the public service commissions under the present law did not have authority to issue orders specifying the number of employes on trains, that they would co-operate in passing an act for that purpose. It was pointed out to the Governor, as it was also explained to the Governor of New Jersey, that the proposed law meant a large increase in the operating expenses of the railroads, that the general introduction of air brakes on freight trains had reduced instead of increased the work of brakeman, that an addition to the number of trainmen would tend to make men careless, and that in the long run, the public would pay the increased cost, either in higher rates and fares or in decreased service.

The strongest statement in condemnation of the Full Crew law was made by Mr. Joseph Wood, First Vice-President of the Pennsylvania lines. This was based on experience in states having full crew laws, and was to the effect that additional brakemen were not needed "either to promote safety or to facilitate operations, and that employment of men on trains when not needed for service, is a menace to safety of operation."

Governor Sulzer deemed it necessary to issue a public statement justifying his act in signing the bill. The only argument which he advanced in its favor was that the measure was designed to increase the safety of railroad operation. The railroads repeatedly challenged the advocates of the full crew law to present evidence in support of this position without calling forth any response. The explanation is nothing more than a flimsy excuse, unworthy the position of the man who offered it.

The Legislature of Oklahoma recently passed a Full Crew Bill which Governor Cruce vetoed. The following extract from his veto message is applicable with equal force to the situation in New Jersey and New York: "The practical effect of this bill," he said, "would be to give employment to a number of railroad men without increasing the efficiency of the service, and would be supplying positions for three men to do the work which can be done by two. It is in entire harmony with the principle that has prevailed in this state of creating an army of officials to do the work that ought to be done by half that number of men. This Legislature has set itself to the task of reducing the number of officials drawing salaries from the state, and a Herculean task it is proving. It is certainly inconsistent while trying to curtail the number of useless public officials, to increase the number of appointed employes, who, in the end, must draw their subsistence from the same source that is now drawn upon by these useless public employes."

A serious situation is presented by the enactment of this legislation. President Rea, of the Pennsylvania Railroad Company, at the hearing before Governor Fielder on the New Jersey bill, asserted that the full crew law, now operative in Pennsylvania, costs his company $577,000 a year. He estimated that the cost to New Jersey would be $253,000 annually. The New York law, it is estimated, will cost the New York railroads over $2,000,000 a year. The railroads must make up this deficiency from some source.

NECESSITY FOR INCREASED RATES

The only adequate measure of relief for this and other conditions, rests in the carriers' ability to procure a prompt readjustment of freight rates. Recognizing this fact, Eastern railway presidents held a conference in New York on April 28th, at which a committee consisting of Presidents Willard, Rea and Brown was selected to take up this question, and as soon as possible make application to the Interstate Commerce Commission for a reopening of what was known in 1910 as the Eastern Advance Rate Case, which was heard and passed upon by the Commission in that year. President Wil-

Digitized by Google

lard, in reviewing the situation, has made the following public statement:

"When the matter of an increase in rates of freight was considered three years ago, it was proposed by the railroads to increase generally the so-called class rates and some of the commodity rates. It was urged at the time by those opposed to the suggested advances that a fairer and better way to obtain an increase if necessary would be by a small advance on all rates instead of the larger advance as was proposed, of some of the rates, and it has been very clearly brought out during recent years, and particularly in the numerous complaints filed with the Interstate Commerce Commission, that the relation of rates between localities is of much greater importance to the shipping public than the actual rate *per se*. With this in mind the carriers now hope to obtain the consent of the Commission for an advance of five per cent on freight of all character, and it is believed that such an advance if granted will create little, if any, disturbance in commercial conditions.

"The railway executives feel that the changed conditions which have come about have so narrowed the margin between income and outgo that a ten per cent increase of all freight tariffs would be justified. They recognize, however, the importance of obtaining the necessary revenue in such a way as to cause the least possible disturbance of commercial conditions and on that account feel that it would be better to ask for an increase of five per cent only at this time.

"It has been urged in certain quarters that some of the commodity rates now in existence are relatively too low and that they ought to be raised before any general advance is made, and to this view the railroad executives freeely assent, but they also say that while they would be glad to see a better adjustment of these rates, it can only be brought about by the co-operation of the shippers with the railroads and with the assistance of the Commission.

"Since the previous hearing the railroads generally have expended large sums for equipment and additional facilities and while there has been some response in the way of increased gross revenues, the surplus income after paying charges and dividends, has been so narrowed as to not encourage the further expenditures required to keep the railroads abreast with the growing demand of the business of the country.

"The bearing of this situation on the question of rates was aptly referred to by Commissioner Prouty in his opinion on the previous hearing:

> "'Our railroads should be kept in a high state of efficiency, and railroad charges should be sufficient to permit this. Necessary extensions and improvements should be made, and the treatment of our railroads by the public should be such as will inspire that confidence in the investing public necessary to obtain the funds for such additions.'

"Unless the carriers are enabled to increase their revenue in some manner, and the plan above proposed seems likely to meet with less opposition than any other, their ability—already limited—to provide such additional equipment and facilities as will be necessary to take care of the growing demands of the country will be very seriously impaired."

CLOSE OF THE FIREMEN'S WAGE CONTROVERSY

On Friday, April 11th, the final briefs were submitted to the Arbitration Committee appointed under the Erdman Act which had been hearing the case of the firemen for higher wages. The main argument of the firemen was the desirability of uniformity in wages and conditions on the fifty-two roads which were parties to the proceedings. Uniformity in rates, rules and conditions of service prevail in the mining industry, the printing trade and the building trades. In the textile, steel and railroad industry, lack of uniformity is the rule. The firemen argued from the comparative stability of relations between labor and capital in the three industries first mentioned, as compared with the unsettled conditions, particularly evidenced in the railway industry, that uniformity of labor conditions should prevail. The firemen went even further in their demand for uniformity in rates and rules. Their brief contended that this should not be influenced by the relative wealth of railroads "because in no other trade or industry does the wealth of the employer fix the wage of the employe. The difference in the bank accounts of an employing printer or builder in no way influences the wage of the journeyman printer, the carpenter or bricklayer. The less prosperous railroads profit as greatly by the labors of the locomotive firemen as do the wealthiest railroad corporations. The productive efficiency of the locomotive firemen is as great on one railroad as another, where the same class and weight of locomotive is used, and the financial returns to a less prosperous railroad from the firemen's labor on the same class of locomotive, is sometimes greater than to the more prosperous railroads because of higher local freight rates." The firemen, also, argued for higher wages on the ground that the cost of living has advanced, and that working conditions for the firemen in the railway industry are far more severe than before the introduction of the heavy trains and large locomotives of today.

Looked at merely as a piece of logical argument, the brief of the railroads submitted by Elisha Lee, chairman of the Committee of Managers, is far superior to the brief of the firemen. In their original demands

Digitized by Google

asking for standardization of wages and working conditions in the Eastern district, the firemen asked that "rates of wages that are higher and conditions of employment that are better than those asked for in the present movement shall remain in effect." Mr. Lee pointed out that in making this demand the firemen have furnished a conclusive answer to their arguments for standardization of wages and conditions of employment. If their demands were granted, while these exceptions are retained, a new basis would be laid for fresh demands in the future, based on the same argument of inequality of wages and working conditions. On the main point of standardization the railroads claimed that this is wrong in principle and unjust in practice. Standardization fails to recognize dissimilar physical characteristics on different parts of the same road; variations in traffic conditions on different roads, or parts of the same road; general differences in wages in different localities within the district, and finally, standardization altogether disregards the ability of the company to pay. Upon this last point the effective argument is based, that the more prosperous roads are those of heaviest traffic, and generally speaking, those which make the heaviest demands upon the firemen.

The brief devoted much attention to the demand of the firemen that two men be placed on certain locomotives. In answer to the demand of the firemen that the three-man standard should be fixed for those engines in through freight service weighing 200,000 pounds or more on the drivers, Mr. Lee showed that the weight on the drivers does not itself determine the amount of work demanded of the fireman, and he further pointed out that recent improvements are reducing the amount of fuel handled by the firemen to a considerable extent.

In conclusion, the brief stated that "to grant the firemen their demand for annual increases in pay of 35.5 per cent would have a strong and well nigh irresistible influence towards bringing about large collateral increases in other classes of railway employes. * * * * Early in the year 1910 the conductors and trainmen made certain demands for increased wages, which were finally disposed of by granting adjustments covering a large part of the territory, either through mediation, arbitration, mutual un-

Chambers, in the center, was chosen under the Erdman Act as the third member of the Commission. He has been a member of a number of international courts of arbitration, and was the third arbiter several years ago in the dispute between the western roads and their firemen.

Digitized by Google

derstanding, or a general advance. Later, the firemen received like adjustments, and still later the engineers' wages were also adjusted. In the early summer of 1912 the engineers again made further demands which were finally arbitrated when they were granted certain increases throughout the territory. Now the firemen are here again, and the conductors and trainmen have already made further demands and are now urging the railroads for prompt action. How long such demands, which up to the present time always have resulted in additional burdens on the finances of the railroads, can continue without impairing the credit of the railroads, depends very largely on the decision in the case of the firemen."

As anticipated, the award, which was made on April 23d, was in the nature of a compromise and grants an estimated wage increase to the firemen based on a standard classification of locomotives of from 6 to 9 per cent over their present wage scales. This, it is understood, will mean an additional burden of between $2,000,000 and $3,000,000 to the annual pay rolls of this element of transportation labor. The new rates went into effect May 3, or ten days from the date on which the award was made, and remain in effect one year. Certain other concessions were made as to working conditions, but the arbitrators refused to make their award retroactive as of date July 1, 1912, which the firemen demanded, and also refused to uphold the firemen's contention with regard to the necessity for two firemen on all locomotives over a certain weight. The Board holds that "when a second fireman is deemed necessary on any engine, or assistance is deemed necessary on any engine where one fireman is employed, the matter will be taken up with the proper officials by the firemen's committee. Failing to reach a settlement, the matter shall be referred to an adjustment committee, to be composed of five persons, two of whom are to be chosen by the railroad company, two by the firemen's committee and one to be selected by the four thus chosen, which shall be chairman of the committee." Speaking generally, the award emphasizes the extreme difficulty of controlling the constantly increasing cost of labor. The possible effect of such a finding upon other demands now pending, is one of its chief points of interest to railway officials. The full text of the awards of the Arbitration Board will be found in another section of this issue.

THE OMINOUS ATTITUDE OF RAILWAY LABOR

On April 22d the representatives of the trainmen and conductors on the fifty-two railroads in the Eastern district held their first meeting with the Conference Committee of General Managers of the same railroads, in an attempt to solve the demands made recently by these organizations for higher wages and changes in working rules. On May first the trainmen were informed that their demands could not be granted. The general movement for higher wages, to which reference has just been made, is already in progress. Next, in order, will be the switchmen who, already, in the Chicago district, have threatened a strike. After these difficulties have been adjusted, if they can be adjusted, it will be time for the engineers to repeat their demands, and so the round of demand, negotiation, disagreement, arbitration and concession will begin again, with no limit in sight save either the arrested development of the railroads, with bankruptcy of the weaker companies, or a widespread railroad strike which may be necessary to bring home to the people the intolerable situation in which the railroads find themselves. The position of the railroads towards the demands of trainmen and switchmen is considerably stronger than in their negotiations with firemen and engineers. Trainmen and switchmen are not skilled mechanics; they are not considered as indis-

Digitized by Google

pensable as are engineers and firemen; their places can be more easily filled in the case of a strike; they are in no sense labor monopolists. The railroads are in a far better position to vigorously resist the demands than in the two previous negotiations. It is impossible for them to assert, moreover, that the difficulties attending their employments have been seriously increased, and it is undisputed that their wages have been greatly advanced in recent years.

GROWING DISSATISFACTION WITH ERDMAN ACT

The railway managers are firm in their determination to bring this intolerable situation to an end. As the Railway Business Association says in a recent bulletin, "The Erdman Act has all but broken down. The number of arbitrators provided, three, is entirely inadequate to handle a big wage question; the time allowed, thirty days, is too short for a thorough investigation; and the available wage statistics are unsatisfactory." The act should be extended, the bulletin continues, to apply to all classes of railway labor instead of to train service employes only. At present it is satisfactory to neither party and the Association urges that it should be amended forthwith, or legislation substituted for it providing a form of voluntary arbitration so little open to valid objection as to deprive disputants of all reasonable excuse for declining arbitration under the law. To postpone remedial legislation is to invite widespread and perhaps national disaster at any moment. It is believed that both sides can unite in supporting legislation which shall provide the machinery for complete investigation by competent experts who shall possess, because of their positions, the confidence of all concerned of the facts in any controversy of this character, so deeply affecting the public interests. Upon the basis of this finding of facts, which should be made public before action is taken, it should not be difficult for the contending parties to reach some basis of agreement, either by direct negotiation or by referring their differences to some arbitration board.

HONORABLE SETH LOW.

President of the National Civic Federation which has recently organized a committee to propose amendments to the Erdman Act.

The great difficulty in recent arbitration has been the absence of reliable data upon which both parties could agree. The figures compiled by the Interstate Commerce Commission are generally regarded as unsatisfactory, mainly because they are susceptible to a variety of interpretations. It is conceded by railway officials and railway labor leaders that the basis for any permanent solution of the railway labor question must be the establishment of an impartial public agency which shall ascertain the facts bearing upon the various controversies which are continually arising. Such facts as wages paid in different classes of the railway service and on different railroads, and for different work, changes in working conditions, and ability of the railroads to pay,—facts which are not now available, and which must be compiled as the result of continual investigation by a permanent organization. Without these facts, public opinion which must be relied on as the ultimate arbiter in controversies of this character, cannot act intelligently, and if these facts are disclosed, it is a safe prediction that neither the railroads nor their employes can maintain positions which reliable and generally accepted information shows to be unreasonable and, therefore, untenable.

The department on Industrial Mediation law of the National Civic Federation has organized a committee to propose amendments to the Erdman Act and a bill for that purpose will soon be ready for presentation to Congress. The Erdman Act has no friends; it is, in subsance, the reference of all controversies to one man who acts as an umpire between representatives of the two contending factions. His award must necessarily be a compromise and, therefore, satisfactory to neither side. Even defective machinery, however, will work if given satisfactory material. No matter what the

Digitized by Google

form of arbitration machinery established by the law will finally be, if only the exact facts can be placed before the arbitrators, it is a safe conclusion that justice will be done.

THE EFFECT OF THE PARCEL POST UPON EXPRESS REVENUES

It is useless for a private enterprise which must be operated for profit and with reference to the cost of production, to compete with a government department which can draw upon the limitless reserves of taxation to replace its losses. The inauguration of the parcel post has cost the express companies about six million a year. According to statements submitted to the Interstate Commerce Commission by counsel for the companies in their final arguments against the reduction in express rates proposed by the Commission, it was declared that the companies have suffered a loss of approximately 25 per cent in their small package business. The express companies cannot reduce their plants or adjust their business to meet the government delivery prices, particularly with the parcel post applying to the rural districts. They are helpless in the face of government competition. To add to their difficulties, it is altogether probable that the scope of the parcel post will be quickly extended to take in packages of more than eleven pounds in weight, and it is certain that many improvements will soon be introduced into the service which will greatly increase its popularity. It is proposed by the

B. D. CALDWELL.
President, Wells Fargo Express Company.

W. M. BARRETT.
President, Adams Express Company.

Postoffice Department to speedily establish a C. O. D. service by which upon the payment of ten cents in addition to the regular charge, the postoffice will collect for your package and remit for the amount up to $100, charging the additional money order fee for the remittance. A special delivery service will also be instituted in this department, and the style of stamp is to be changed. The business is growing at an extraordinary rate in spite of the drawbacks which these reforms are intended to remedy. During March the parcel post business showed a gain of 12,000,000 packages over February. At the present rate of increase it is believed that 750,000,000 packages will be handled by the parcel post during the first year of its operations, and the revenues of the Postoffice Department is estimated at $50,000,000, of which between a quarter and one third is estimated at profit. With the profits realized from the small package business further extensions of the service can be made into less profitable fields.

It is this situation with which the express companies are faced while they are endeavoring to combat the arguments of the advocates of lower express rates which, it is feared, the Interstate Commerce Commission plans to put into effect. Counsel for the companies estimates that the Commission's plan for an adjustment of express rates according to zone, will cause five leading companies a loss of between $20,000,000 and $25,000,000 a year, added to the loss which the parcel post is already imposing

Digitized by Google

upon them. There is peculiar injustice in the reduction of express rates at this time when the government has instituted the most effective form of competition with the express companies and is making such rapid inroads upon their profits. It is to be hoped, in the interest of fair play and in the proper regard to the security of investment, that the Interstate Commerce Commission will defer final action upon their plan for reducing freight rates until the effect of government competition upon express revenues shall become fully apparent.

RAILROAD LOSS FROM FLOOD DAMAGE

It is impossible, at this time, to accurately determine the extent of damage to railroad property caused by the Western floods. In the state of Ohio the damage is placed by some authorities at $10,000,000. The total amount of damage sustained by the Baltimore and Ohio is estimated at between $2,500,000 and $3,000,000 in Ohio and West Virginia. A total estimate of $20,000,000 in the three states mainly affected by the floods, is probably not an exaggeration of the cost to the railroads of repairing the damage done their property. The lessons of the flood from the standpoint of railway interest are plain. Much has been heard in recent years of what constitutes a proper rate of return on railway investments. The Interstate Commerce Commission is apparently dominated by the conviction that the railroads ought not to make more than six or seven per cent on the amount invested in their properties, and that their present earnings are well above the standard. This enormous flood damage to which railway property in other parts of the country, notably in the lower Mississippi Valley is also liable, illustrates the necessity of revising these opinions of an "adequate" rate of return and of the "reasonableness" of freight and passenger rates out of which these returns must come. Railway rates and railway revenues must be large enough, not merely to furnish a fair return to the investor in dividends and interest, but also to enable the railroads to build up large surpluses and reserves out of which they may replace damage resulting from extraordinary disasters, such as the middle western floods, for which ordinary appropriations for maintenance and depreciation are entirely insufficient. The cost of repairing this damage will make heavy inroads upon the surplus revenues of the companies affected. In some cases it will result in deficits, and in every case, in the postponement of necessary improvement and new construction for the betterment of the service. In the long run the public will be the loser, along with the investor.

As President Willard remarked in discussing the damage sustained by the property of the Baltimore and Ohio, that his

Digitized by Google

company would have no difficulty in repairing the damage because it had recently arranged for a large amount of new capital. The repairs must, however, result in the postponement of a large number of additions and betterments in the territory affected. It is not in the interest of the public that the progress of railway improvement should be halted or that large corporations should be hampered by lack of means in their performance of an indispensable public service. The lessons of the floods is, therefore, plain, that railway rates are reasonable only when they yield sufficient revenues to provide for these "extraordinary replacements" and repairs.

BUSINESS AND THE ADMINISTRATION

Political interest now centres in the tariff bill. As introduced by the Ways and Means Committee this measure makes sweeping reductions in a great number of articles. The theory of a tariff for revenue has been apparently rejected along with the theory of a tariff for protection. The Democratic party has merely attempted to cut down tariff duties without much regard to the revenue possibilities of the new schedules. The estimates of the revenues and expenditures under the new measure show a deficit of nearly $69,000,000. This deficit is to be made up by the graduated Income Tax, which, it is estimated, will produce about $70,000,000. The object of the bill is ostensibly to reduce the cost of living,

CONGRESSMAN OSCAR UNDERWOOD.
Author of the tariff bill which has aroused manufacturing interests throughout the country.

and also to "eliminate protection of profits, and to cut off duties which enabled industrial managers to exact a bonus for which no equivalent is rendered.

"To introduce in every line of industry a competitive tariff basis providing for a substantial amount of importation, to the end that no concern shall be able to feel that it has a monopoly of the home market gained other than through the fact that it is able to furnish better goods at lower prices than others."

Manufacturing interests are deeply aroused by what they consider a direct attack. They have accepted the doctrine that tariff reductions should not reach the point of disturbing domestic industry. Wherever duties were higher than the amount of difference between the foreign and domestic labor costs, there is now a general agreement, even among those directly concerned, that such duties are indefensible, and should be reduced. The Democratic bill, however, has gone far beyond this, reducing duties in many lines to the point where manufacturers would either have to cut wages or abandon the production of the finer grades of the product in which the labor cost is high.

The attitude of the manufacturers is well expressed by Mr. Louis W. Parker, a Southern cotton manufacturer, who voiced the following opinion in an interview: "With present cost of production manufacturers of combed yarn and of the higher counts, and of the fabrics made from them will not be able to meet foreign competition under the rates proposed by the Ways and Means Committee. They will either be forced to reduce their production costs by lowering the wage scale, or go into the manufacture of coarser goods, or go out of business. Inevitably many of them will turn to the coarser goods; this will bring over competition in this division of the industry, and so the whole industry, in every direction, will feel the disastrous effect of the new tariff."

This opinion is widely echoed by representatives of every industry. There is genuine alarm over the prospect that the passage of the tariff bill will introduce a vast deal of disturbance into industries with consequences to business which it is impossible to forecast.

In tariff revision, as in the settlement of railway labor disputes already referred to, the most evident need is for the establishment of an impartial, permanent tribunal which shall ascertain the exact facts upon

Digitized by Google

which revision can be based. It is impossible to deny that the methods of general tariff revision, as exemplified in the last four tariff bills, has proven very unsatisfactory, or that the practically unanimous desire of business men affected is to have this method changed in such a way as to take tariff revision out of politics.

The Income Tax measure has aroused an almost equal amount of criticism. The objection is not to the principle of the income tax, but to the basis on which it is imposed and the method of collection. All incomes in excess of $4,000 a year, however derived, whether from profits, investments, business, salaries or wages, are to be taxed and the rate of the tax is to increase with the increase of income, a levy of 4 per cent being imposed on sums above $100,000. This increase in the rate of taxation is extremely obnoxious. It is a direct incitement to confiscation and it penalizes the accumulation of wealth, accumulation which, since it is always invested in productive industry or in real estate, already pays large taxes to local and state governments.

Serious exception is also taken to the method of "stoppage at the source" which is applied in a very broad way in the law. To prevent the possibility of evasion the tax is to be levied at the source of income. The employer is to pay the tax for his employe. Financial corporations and bankers must deduct the tax in the payment of interest on bonds, mortgages and other indebtedness, even though in any particular case, the interest or dividend does not amount to $4,000. In case the recipient of such income is entitled to exemption, he can secure it by filing with the person or corporation who is required to withhold and pay the tax for him "a true and correct return of his annual gains, profits and income from all other sources, and also the deductions asked for; and the showing thus made shall then become a part of the return to be made in his behalf by the person required to withhold and pay the tax, or such person may likewise make application for deductions to the collector of the district in which return is made or to be made for him."

It has always been the principal objection to the income tax that it puts a premium on false declaration. To prevent such false declaration this extraordinary devise of "stoppage at the source" has been devised. The obligation to pay the tax will not rest upon the tax payer but upon him who handles and pays over the income. It is a question, however, if this will serve to prevent evasion, and it is certain to cause an extraordinary amount of friction and resulting hard feeling.

The Administration's policy on the trusts and the money question has not yet been formulated in bills. It is known, however, that a continuation of the anti-trust campaign by the Department of Justice is in contemplation, and that a comprehensive scheme of monetary reform involving the creation of a number of district reserve banks under the general supervision of the central government is in contemplation. The attitude of the Administration towards the trusts was clearly set forth in an address by Secretary Redfield before the American Cotton Manufacturers' Association in which he raised a serious doubt as to whether trusts were really necessary for industrial efficiency, and President Wilson in the current number of *World's Work*, writing on the "New Freedom," says: "We design that the limitations on present enterprise shall be removed so that the next generations, as they come along, will not have to become proteges of benevolent trusts, but will be free to go about making their own lives what they will."

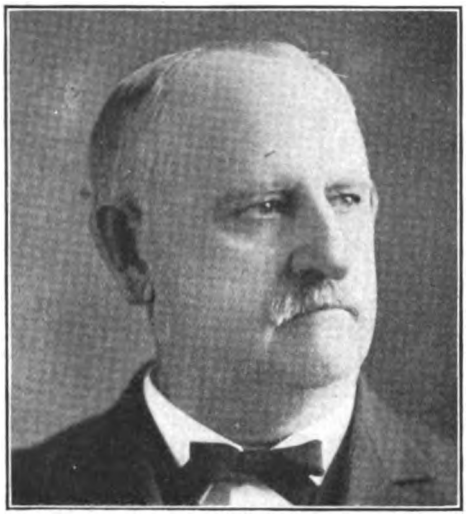
The plan for a revision of the banking law is directly aimed at the financial supremacy of New York. It is planned to scatter the reserves which now centre in the banks of New York City, dividing them among fifteen reserve banks located in different sections of the country. By this distribution, it is expected that the control which New York has hitherto exercised over the finances of the nation will be greatly weakened, and the alleged evils which have arisen out of that domination will be remedied.

This is an ambitious program which President Wilson has set before his party. In all probability, the tariff bill will go through substantially as it was introduced into the House. The President is determined upon its passage, and with the great amount of patronage which is still at his disposal, he will be able to make his wishes effective in Congressional action. The Income Tax bill is also reasonably certain to pass, although some of its more obnoxious features, to which attention has already been called, are likely to be eliminated. There is no reason to anticipate any let up in the prosecution of the industrial combinations, although the Department of Justice will for some time have its hands full in completing the work begun by Mr. Wickersham. The program

Digitized by Google

of financial reform is yet too nebulous to be the subject of decided comment.

This program of economic reform is very drastic. Much time must elapse before the American people can readjust themselves to these new conditions. The period of readjustment is likely not merely to be prolonged, but to be attended with a certain amount of business stagnation. Whether this result will be sufficient to overthrow the Democratic party, and whether, in case history repeats itself, these very positive legislative actions can be reversed, are matters which the near future may be expected to reveal.



CONGRESSMAN T. W. SIMS,
Author of bill to repeal provision in Panama Canal Act for toll exemption of coastwise shipping.

THE ADMINISTRATION'S ATTITUDE TOWARDS PANAMA TOLLS

President Wilson's attitude on the Panama Canal toll question has not yet been announced. It is believed, however, from all the evidence available that he regards it improper for the United States to exempt its vessels in the coastwise traffic from paying tolls on the ground that the proposed exemption is in effect a subsidy. Some anxiety is felt in shipping circles over the reported intention of the Administration to build ships for the through canal traffic in order that there may be a means for holding rates down to a reasonable level. There is also anxiety over the announced intention of the Hamburg-American Company to finance a $15,000,000 steamship corporation for the exploitation of the canal traffic. The monopoly of the coastwise traffic which is supposed to be secured by present law, could be easily evaded by this method, since the vessels could be constructed in American shipyards.

Congressman Sims, of Tennessee, is the author of a bill for the repeal of that provision in the Panama Act providing for the exemption of coastwise shipping engaged in the coastwise trade. He estimates that there will be a majority of at least 50 in the House of Representatives for the repeal of this law. This will involve the repudiation of the plank in the Democratic platform providing for free tolls for American ships. This plank was put in the platform by the influence of Senator O'Gorman and it is feared that the Senate may be the stumbling block to the repeal.

THE HARRIMAN DISSOLUTION PUZZLE.

The Union Pacific dissolution is advanced closer to a solution by the action of the Circuit Court judges in making certain suggestions to counsel for the Union Pacific and also to District Attorney Houpt, of St. Paul. These suggestions relate exclusively to the disposition of the Southern Pacific stock. The court holds that the stock should not be sold to Union Pacific stockholders up to the point where these stockholders shall be in practical control of a competing company. The court finds that 1,440 Union Pacific stockholders also own $92,162,400 of Southern Pacific stock, exclusive of the $126,650,000 of stock involved in the suit. "In view of

JOHN M. ESHLEMAN,
Chairman, Railroad Commission of California.

Digitized by Google

these facts," said the court, "it seems the disposition of as much as $40,000,000 of Southern Pacific with voting power to the stock of the Union Pacific Company might give practical control of that company to Union Pacific stockholders, and the question of what amount, if any, of the Southern Pacific may be safely transferred to them is suggested as an argument for consideration."

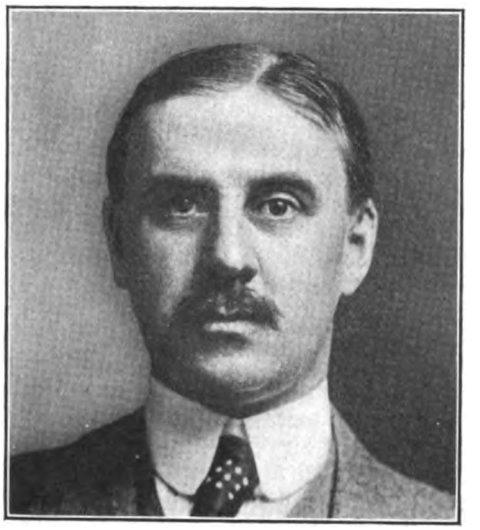
This suggestion, in effect, a declaration by the court, which has also granted a sixty-day extension to the company, to devise a plan of dissolution which shall meet the requirements, points the way to a solution of a difficult problem. It has been proposed that the Union Pacific offer the Southern Pacific stock to the stockholders of the two companies excluding, however, a certain limited group of Union Pacific stockholders from the privilege, and with the guarantee of an underwriting syndicate to insure the success of the transaction. This plan, it would seem, meets the government's objections.

We note with surprise, however, that the Circuit Court has accepted the view of Mr. Brandeis and his fellow critics of the Oil and Tobacco dissolution plans, that a combination in restraint of trade can be effected by individual ownership of a controlling interest in two competing companies even though that ownership is divided among thousands of stockholders and is not concentrated in a corporation or voting trust. The court evidently believes that these 1,440 Union Pacific stockholders will find some method at present unknown to the law by which they can acquire sufficient facility in thinking and acting along identical lines in their choice of direction to continue the illegal combination. We refrain from comment upon this extraordinary attitude of the judicial mind. If carried to its logical extreme it will compel each investor to limit his purchases to the securities of non-competing companies.

As for the Central Pacific, the opinion is now that its ownership will be left undisturbed and that the Union Pacific will make a traffic agreement with its western connection. From the standpoint of eastbound traffic delivered to the Union Pacific, this arrangement possesses great advantages over the former plan by which Union Pacific purchased the Central Pacific stock. If this plan had prevailed, the Southern Pacific would have had no incentive to send its eastbound traffic over the Central's line, and the Western Pacific might have been given a substantial share of this business. Under a traffic agreement, it would be to the interest of the Southern Pacific to turn over all its eastbound business requiring quick transportation to the Central Pacific and Union Pacific in return for the delivery of Union Pacific westbound tonnage to the Central Pacific at Ogden.

IMPROVEMENT IN THE NEW ENGLAND SITUATION

New England is at last coming to its senses. The first evidence of returning sanity is the report of the Boston Chamber of Commerce adopted on April 1 on the railway situation



JAMES J. STORROW,
President, Boston Chamber of Commerce, whose organization is against present disintegration of New England's system of railroads.

which while abounding in criticisms of the Boston and Maine and in suggestions for the improvement of its equipment and service, took strong ground against any legislation calculated to disturb the present relations between the Boston and Maine and the New Haven and Hartford. This marks the definite abandonment of the attempt to separate the two companies, an attempt which, if successful, would have resulted in serious damage to the Boston and Maine which would be powerless without the support of the New Haven to raise the capital for the rehabilitation of its property and for the large additions to its equipment which are required that it may handle the traffic offered. Next in order should and probably will be the dropping of the absurd charges of conspiracy in restraint of trade, and a rapid

Digitized by Google

retreat of public opinion all along the line from their positions of extreme hostility which under the leadership of Mr. Louis D. Brandeis it has assumed.

In connection with the dying agitation against the Grand Trunk, which it was alleged conspired through its officials, with the officials of the New Haven and Hartford, to stifle prospective competition by abandoning construction of the Southern New England Railroad, there is an interesting announcement. On behalf of the Grand Trunk it is proposed that that company will turn over the unfinished property of the Southern New England to the State of Rhode Island, giving up to the state the results of an expenditure of $2,500,000, on condition that the state undertake to complete the road from Palmer, Massachusetts, to Providence, and to arrange for its operation. If this is done the Grand Trunk through the Central Vermont will either make a traffic agreement with the Southern New England; or the Central Vermont will lease the new line at a rental corresponding to 5 per cent on the actual cost of completion. The Grand Trunk is not financially able to complete the Southern New England, and if Rhode Island is not willing to come to the assistance of this ostensibly long hoped-for and ardently desired project, the contractors may be requested to remove their tools and apparatus. Thus is here offered an opportunity to Rhode Island to secure a through line into Canada entirely independent of the New Haven. The offer is made in good faith, and its treatment by the state will show the strength of the popular demand for railway competition in Southern New England.

PUBLIC DISCUSSION OF RAILWAY PROBLEMS

During the month the transportation problem, in some of its various phases, was discussed by a number of prominent railway officials.

Mr. Frank Trumbull, chairman of the Board of Directors of the Chesapeake and Ohio Railroad, in the course of an interesting address before the New York Traffic Club, directed the attention of his audience with especial emphasis to the rapid increase in regulative and restrictive legislation affecting railroads. His comments upon this point were as follows:

"There were more than 200 bills affecting railroads pending in the legislatures of this country last January. Some of these are as dangerous and drastic as they are in other instances ridiculous.

"There are bills to prohibit railroads from using the piece work or bonus system in their shops, to furnish engine cabs with spring seats; to transport freight at a minimum speed of 20 miles a day; to change the air in railway depots five times every hour; to give seats to persons who have bought season tickets, but leave them at home. Trespassing on railroad property, however, has only been recognized in three states.

"A total of 855 bills were introduced in Congress during the past two years affecting railways. Many of these get no further than committees but some of them do concern us. The parcel post law in force since the beginning of the present year has forced the railroads to carry the extra mail burden without adequate compensation. The self-sustaining power of the Postoffice Department is due primarily to the efficiency of the carriers.

"Regulation of railroads and industries in this country is steadily rising around the brinks of our commercial progress and we must be very watchful. Many bills are now pending in Congress which, if passed, would have a serious effect on industry.
* * * *

"The more legislation affecting railroads the more there will be to affect the general business of the country. We should prohibit overworking of men and provide for their safety in employment, etc., but I do not believe that regulation should be partisan. The railroads and business should keep out of politics and politics should be kept out of railways and business."

President L. F. Loree, of the Delaware and Hudson, discusses in a brief way, in his annual report, the various factors which are causing constantly increasing railway expenditures without providing for larger revenues. He presents and discusses an extremely interesting table showing the trend of return on railway investments during the past five years, in the following manner:

"In view of the constantly growing expense of operation, due to the demands of labor, to the increased cost of material, and to the new federal and state laws, which to a large degree needlessly and unreasonably increase the number of employes, and with no corresponding increase in the freight rates,—the following table indicating the investment which all of the carriers reporting to the Interstate Commerce

Digitized by Google

Commission have made in property devoted to public use and their return on the total investment and on the new money going into the property since June 30, 1907 (the date that the new Operating Expense accounts of the Interstate Commerce Commission became effective), is of especial interest:

"It will be noted that the investment in Road and Equipment increased approximately $273,000,000 in 1908, $395,000,000 in 1909, $779,000,000 in 1910, and $597,000,000 in 1911, so that on June 30, 1911, the investment in the property devoted to public use was, $2,044,417,617 in excess of the investment on June 30, 1907.

"Comparing with 1907, there was available for interest and dividends approximately $119,000,000 less in 1908, $43,000,000 less in 1909, $52,000,000 more in 1910, and $9,000,000 less in 1911.

"In other words, the year 1910 was the only year in which the railroads received any return on the new money going into their property devoted to public use, and in that year they received only 3.56 per cent on the increase of $1,447,436,879 in the cost of Road and Equipment on June 30, 1910, as compared with the cost of June 30, 1907, while in no year did the rate of return on the total investment equal the 5.82 per cent earned in the year 1907.

"It will be noted that the taxes for the year 1911 increased approximately $23,000,000, or 29 per cent over the year 1907.

"The necessary annual increases of capital investments by railroad corporations of the character above indicated must be largely made through new issues of long term securities. Such securities will hereafter be placed with some difficulty at such rates of interest as the companies can afford to pay, unless there can be secured to the carriers a fair rate of return upon the cost of the improvements to their properties."

At the National Conference at Chicago to consider improvement in the distribution of farm produce between producers and consumers, Chairman B. F. Yoakum, of the Frisco Railway Company, called attention to the need of additional railroads in the country west of the Mississippi River, which he said is rapidly becoming the producing territory for surplus agricultural products.

"There are not over 1,000 miles of new railroads now under construction in the United States," he declared, "while on June 30 last it was officially stated that the Dominion of Canada had 10,000 miles of railroad under construction. Our public men as a rule have not yet realized what confronts us in the way of agricultural development. The production of food supply, its movement from the farm to the market and its relation to the consumer require the same scientific and intelligent consideration as does the movement of raw materials to the manufacturer, in readjusting our present tariff schedules."

Mr. Yoakum, in dealing with the wastes of distribution placed at $35,000,000 the value of 100,000 carloads of fruits and vegetables which rot on the ground from the lack of shipping and storage facilities and knowledge of receptive markets. The loss in vegetable fibres burned is placed at $250,000,000 and the additional gains which farmers should receive by occupation in selling to best advantage at $1,500,000,000, making a total loss from waste, mainly due to defective distribution, of $1,785,000,000.

Attacking the farm problem from a different standpoint, Mr. James J. Hill, in a recent interview, called attention to the necessity for diversification of crops and improvement in agricultural methods. "Money is high in the East, and I believe that railroads should exercise extreme caution in making financial commitments just now. The outlook is not altogether favorable. Everyone wants money and everyone is paying high prices for it. Great Northern, already in a strong financial condition, will maintain as large a cash balance as possible, against future contingencies. It may be true that European funds will be released when the Balkan war is settled, but will they come here?

"In the Northwest," he went on, "the banks are loaning money to farmers to encourage the raising of cattle and livestock. We do not want to encourage land speculation. It may be a good thing for our farmers not to raise so much wheat. They should turn their attention to the coarse grains, like oats and barley. Let them feed their surplus of these grains to their cattle and live stock. They will like the diet and thrive on it. Corn is not necessary as fodder. Why, last summer a farmer from Manitoba brought a steer down to Chicago who had never seen a peck of corn. That steer swept the boards and took all the big prizes. * * Suppose that the yield per acre of wheat is increased ten bushels, bringing it up to 25 bushels. On our acreage of 46,000,000 that would mean 460,000,000 more bushels of wheat every year. What would happen to wheat prices? Why, they would go down to 50 or 55 cents a bushel. Germany, England, Belgium, France and other Continental countries are applying with great results, the principles of intensive development. Why can't we do the same?"

President Mellen, of the New Haven, is continuing his campaign to educate the people to an understanding of the transportation problem, and of the difficulties which his company is encountering in its solution. His latest utterance published, as those which preceded as an advertisement, follows familiar lines. He refers to New England as a great terminal yard, in which real competition among railroads cannot exist, whose railway system is foreordained to be operated as a unit, and he urges his fellow citizens to assist him in his efforts to remedy the mistakes of construction and location, made in the past, and to unite in an effort to preserve the transportation situation of New England. Mr. Mellen's remarks follow:

"In its relation to the other transportation systems of the country, that of New England should be considered as a great terminal yard in which should be handled the business of all connecting systems of transportation on substantially the same terms and conditions, without discrimination, fear or favor, the same as would be the case were all the New England roads under ownership by the federal government.

"The competition of the New England roads is incidental and not material; were

Digitized by Google

they all erased from the map, should they disappear from the face of the earth and a free hand be given to build for the New England states a system of transportation best calculated for the wellbeing of her people and the largest development of her material resources, and were that task committed either to a corporation or to be performed by the nation, it would result in a substantial duplication of what we now have. No one would rise to claim there was a suppression of competition, and no more should any one now.

"Many of the existing lines were poorly located, and the poverty of these originally constructing them compelled a character of construction ill-fitted to handle the business of the present time. But in the main they were what the territory needed at the time of their construction, and were as good as the business at hand warranted calling into being. Now their business has largely outgrown their capacity for service, and they have arrived at a stage where radical rebuilding and enlargement have become vital, not only to themselves as an agency for service, but to the population whose welfare they were intended to promote and secure.

"Men will come and go, but the system of transportation has been built up to endure, and present agitation and apprehension will be looked upon hereafter as we now look back and smile at the prophecies of trouble and disaster when the Colonies of North America became the United States.

"A creature can never become greater than its creator, and no corporation will ever dominate a community that has the power, resourcefulness, and determination, to govern itself."

Curbing the Sherman Law.

THE following open letter to President Wilson, has been sent by John Kirby, Jr., President of the National Association of Manufacturers, relative to the provision in the Sundry Civil Appropriation bill prohibiting any part of the $300,000 appropriated for the Department of Justice from being used to enforce the provisions of the Sherman anti-trust act against either the associations of farmers or labor unions:

"NEW YORK, April 16, 1913.

"HIS EXCELLENCY, WOODROW WILSON,
"President of the United States,
"Washington, D. C.

"MY DEAR MR. PRESIDENT:—The National Association of Manufacturers, of which it is my honor to be President, is an organization composed of nearly 4,000 manufacturing concerns, in practically every state of the Union. The fundamental purpose of our organization is industrial freedom—freedom from the despotism of unconscionable labor dictation toward both employers and the vast majority of workingmen throughout the country who are unaffiliated with trade unionism. Our organization is non-political. Its spirit is patriotism and loyalty to our Republic, its laws and institutions.

"We affirm our belief in equality of opportunity in the impartial administration of law, believing that upon such framework only can economic and social justice be effectively realized. We do not oppose trades unions, *per se*. We favor them. Particularly, however, do we deny that trades unionism in many of its methods is above or outside of the just administration of law.

"I have observed in the daily papers that there has been introduced into the present session of Congress the Sundry Civil Appropriation bill, wherein there is a provision specifically prohibiting any part of the $300,000 appropriated for the Department of Justice from being used to enforce the provisions of the Sherman Anti-Trust Act against either the associations of farmers or labor unions. You are, of course, aware that this particular provision was incorporated in the Sundry Civil Appropriation bill in the last Congress and was vetoed by President Taft in a strong, vigorous memorandum, with which you are undoubtedly familiar.

"Speaking on behalf of the vast manufacturing constituency comprising our organization, I take the liberty of calling your earnest attention to the inherent and impossible wrong represented by this particular provision. In many of your public utterances you have wisely and clearly emphasized the necessity, in our social, economic, and political body, of striving to attain, in the last analysis, exact justice. With this underlying purpose I express my complete and sincere concurrence.

"But I hasten to assure you that the particular provision under discussion is violative of every consideration of our law and statutes. That the provision is special legislation in ingenious and subtle form will be obvious to you upon careful inquiry. That it is an attempt to subvert the operation of a duly enacted statute of Congress by a covert negativing of the operation of such statute (the Sherman Anti-Trust Act) will be clear to you after the most cursory examination. That such a device, to render abortive a statute enacted by the people, should be promptly and decisively frustrated seems so clear to me that further argument becomes almost unnecessary.

"If the so-called Sherman Anti-Trust Act should or must be amended by due Congressional method, that is a proposition the merits of which will be open for legislative debate and the expression of popular opinion through the people's representatives in Congress.

"But while the law is upon the statute book, and the law contains no exemption, does it not irresistibly occur to you that to limit the operation and application of the law by the subterfuge of a restrictive prohibition through the medium of an appropriation is dangerously near, at least, implied nullification? Do you not see the indefensible character of this exemptive provision, and how utterly at variance such method is to our orderly procedure for the administration of our public laws?

Contemporary Opinion

The Confiscation of Railway Net Earnings.

ATTENTION has before been called in these columns to the growing tendency on the part of investors, to neglect railway securities for those less subject to restrictive influences. No industry of modern times has made a stronger or more consistent effort to produce favorable results under oppressive conditions, and yet the situation of to-day is so charged with uncertainty, so intimately associated with restrictive legislation which recognizes no compelling financial responsibility, that optimism is stretched to the breaking point to gather encouragement from the conditions which confront the carriers. The hope in the situation rests in a growing appreciation on the part of business interests of the vital connection between their continued success and that of an adequate, progressive transportation plant.

Regulation, in itself, is not the bone of contention, for railway officials, generally recognize its necessity and permanency in railway operations. There is a vast difference, however, between regulation which destroys rather than constructs, restricts rather than permits progress, and which adds enormous financial burdens without providing for additional compensation. Such regulation drives capital away from railway investments and leaves those in command poorly equipped to meet the demands of an expanding commerce.

Banking houses, which handle railway securities, have, for some time felt the influence of such regulation upon the public demand for railway securities. The *Bache Review* of April 5th, published by the banking firm of J. S. Bache and Company, has the following to say regarding the general situation:

"It is remarkable that the condition and needs of so great an industry as that of the railroads—the largest industry we have in our commercial world and the one whose prosperity affects favorably all other enterprises—should be neglected. But the railroads for several years have been laboring under adverse conditions, the result of unwise legislative action, and there seems to be no coercive force to relieve them.

"The roads are being hampered by the Interstate Commerce Commission, by the Government in mail contracts, by state legislators and commissions, and by labor combinations.

"The burdens imposed upon them and the privileges withheld make it impossible to earn adequate sums to protect and insure dividends with ample margins of safety and so build up credit, attract investment, and make badly needed equipment and terminal expenditures in sufficient proportion to keep pace with the country's growth and facility-needs. Taxes have been increased enormously and higher wages are being constantly demanded. This week the Full Crew bill was signed by Governor Sulzer and will add $2,000,000 to railroad expenses in this state. This same character of bill was vetoed by former Governor Hughes and Dix and has been killed recently in many states. Railroad men and experts say that no greater safety will be obtained under this bill, but rather that it will prevent other expenditures for real safety which cannot now be afforded.

"Fair play for the railroads should be demanded by the business public, whose vital interests and those of the whole people are damaged by continuance of the present conditions. The four million investors in railroad stocks should make themselves felt in state and national legislatures."

The Latest from Brandeis.

MR. LOUIS BRANDEIS, the Boston lawyer, has again come to the assistance of the railways. This time his mighty intellect has been trained, for the moment, so to speak, on the solution of the Firemen's Wage Controversy; and, presto change, from $50,000,000 to $60,000,000 are saved by more scientific stoking, the firemen's salaries are increased, the railroad coffers enriched, and everybody happy. Simple, isn't it? Of course, Mr. Brandeis might as well suggest that the surest way to settle the question as to whether the moon is made of green cheese, is to send a delegation, preferably of experts of the Brandeis stripe, to investigate. As to the method of procedure, this is a mere detail which should not be permitted to burden the intellect of a genius. The New York *Journal of Commerce*, commenting on Mr. Brandeis' latest remedy for railway ills, has the following to say:

"No doubt Mr. Brandeis is right in assuming that the firemen might shovel coal more scientifically if they were experts in the laws of combustion; and that something might be saved, as at the best, it is estimated that only about 22 per cent of the units of heat ever get transformed into units of working power. The knowledge of this is one of the strongest reasons impelling a substitution of the electrical system as fast and as far as practicable even on long line railroads. The time is fairly estimated within which the railroad stoker will go out of commission except in a very limited way. In any case most firemen would be inclined to sneer at the thought that they don't know their business properly, and the railroads would have a vast job on their hands to break them into new methods. Wage quarrels would not cease as the railroad servant is very apt to raise his terms as the management makes or saves more money, especially if he is credited with being the author of the improved condition.

"If Mr. Brandeis is familiar with the electrical and mechanical problems of railroading as they are being gradually solved, he knows that many of the most competent authorities in the country are confident, that as far as railroads, even, are concerned, the coal problem is tending to solve itself; and that it will not be by improved shoveling, but by eliminating shoveling in toto on locomotives that the permanent great betterment will come about, on a great majority of our railroad lines in the actual running of trains."

The Labor Influence upon Class Legislation.

WHATEVER may be said to the contrary, recent enactment of "full crew" legislation, as, for example, in the states of New York and New Jersey, offers a striking illustration of the "class" influence of organized

Digitized by Google

labor upon the activities of legislative bodies. Both states in question have regulative bodies with authority to deal with matters of this character. Apparently, however, more was demanded than the real requirements of a fair regulation called for, with the result that the "influence" was brought to bear in quarters which are particularly susceptible to its numerical strength. The New York *Journal of Commerce*, discussing the signing of the New York "full crew" bill by Governor Sulzer, has the following, in part, to say:

"There seems to be no doubt that Governor Sulzer's signing what is called the 'full crew bill,' requiring the employment of a specified number of persons in certain parts of the service on railroad freight and passenger trains, was due to the political pressure of the Brotherhood of Railroad Trainmen. A similar bill was vetoed by both Governor Hughes and Governor Dix on the ground that it was not shown that such additions to the 'crews' of railroad trains were necessary either to efficiency or safety, and that it is a matter which should be left to the discretion of the public service commissions upon inquiry into such case. Governor Sulzer in his memorandum of approval of the bill says that 'every safeguard should be employed by the railroads to prevent wrecks and protect the property of shippers and to conserve human life and limb, not only of employes but of the traveling public.'

"Nobody denies that every needed safeguard should be used for these purposes, but it is the universal testimony of railroad managers in states in which such additions to crews have been arbitrarily required, that they were not necessary and have served no such purpose as is pretended. They give employment to more men, make the work of some easier and less efficient, and add substantially to the cost of operation, which must in the end be paid by shippers and the public, unless the railroads are to be hampered in other needed expenditures. It is for the interest of railroads to adopt every safeguard to 'prevent wrecks,' for they are among the most costly incidents of their business. This requirement for what would be more properly called 'surplus crews' for railroad trains is the result of persistent political pressure by a labor union, and its purpose is to secure employment for more men and give them an easier time at the expense of the railroad corporations.

"Governor Sulzer is quoted as denying that he had a conference with Mr. John Fitzgibbon, legislative representative of the Brotherhood of Railroad Trainmen, before the election and promised to sign such a bill if it should be passed, and that he would come out openly for it but for the fact that if he did the railroads would 'spend a barrel of money' to defeat him. But a letter of this same Fitzgibbon to the officers and members of his brotherhood is published, which, if authentic, flatly refutes the denial.

"Regardless of any question that may be raised as to the authenticity of this letter, there is no reason to doubt that what it refers to was an actual occurrence. Its significance transcends in importance the merits of the full crew legislation. It exhibits an organization of workingmen using its influence in politics to secure class legislation for themselves at the sacrifice of every other consideration involved in a state election. Its members are in effect advised and solicited to vote for a particular party candidate for Governor because he favors and will approve a special act of legislation in their behalf, and he is induced to promise to do so to secure their votes. It exhibits 'labor men,' in the sense of members of a labor union, as acting directly as a 'class' in politics in the most insidious way. A labor party, avowing its principles and policy and working openly for its object, can be met openly and voters can favor or oppose its efforts with their eyes open, but nothing could be more pernicious than this kind of secret influence for securing legislation by the virtual promise of votes by such an organized body as a labor union. Are such methods of 'class' influence any less to be condemned when practiced by 'labor' than when they are pursued by capital?"

A surprisingly large number of other newspapers condemn the passage of these laws. As the New York *Evening Post* puts it:

"We do not believe that Governor Sulzer can satisfactorily defend his signing of the Full Crew bill. The railroad presidents who protested against it brought up convincing reasons why the measure should be vetoed. In the first place, they are willing to submit the whole question to the Public Service Commissions for decision. For what else have we created these Commissions, save to deal with just such problems? Why have they been so delinquent as not to order, or to request the Legislature to order, 'full crews'? Surely, they are experts as to what is right between the railroads, the public, and the railroads' employes, and they have yet to learn that there are accidents due to trains being shorthanded. We have heard much about overworked engineers, but very little about undermanned trains. More than that similar measures have been vetoed by such Governors as Harmon of Ohio, Foss of Massachusetts, and Charles E. Hughes of New York. Finally, the railroad heads charge that the $2,000,000 this would cost the railroads would be pure waste. Now, in these days of scientific management, the public, which will eventually have to shoulder this burden, has a very genuine right to have this matter looked into by experts in its behalf. Unfortunately, these bills have been slipped through with little discussion or public knowledge."

Railway Losses and Rates.

IN a recent editorial, the New York *Evening Post*, in discussing the losses occasioned by the spring floods of the Middle West, and their possible effect upon freight rates, has the following to say:

"Estimates of losses to the railroads, caused by the floods, are necessarily only guesswork as yet. They are put at from $35,000,000 to $50,000,000; and the sum does not seem unreasonable when one remembers the number of bridges destroyed, the miles of track washed away, the other physical property wiped out, besides the loss caused by demoralization of train service, delays, extraordinary outlay, and the future diminution of transportation business from the ruined districts. Now we should like to ask the physical valuation men what place in their calculations they reserve for such unforeseeable and enormous impairments of railway property. Will they undertake the role of an earthly Providence, and tell the managers just what the average loss will be from disasters of this kind over a period of years? Or, granting that increased capital expenditure warrants higher freight charges, would

Digitized by Google

they say that the thing for the railways to do would be to impose higher rates at the very moment when the people in the afflicted territory are least able to pay them? Such questions go to the heart of the theory that you can exactly and scientifically determine railroad rates by an exact and scientific physical valuation of railway property. For in the latter there are too many variables to make the process at all a safe guide. This is vividly shown just now in the blow which the railways have received through the floods. But the same thing is shown all the time in a thousand ways, less startling, but no less conclusive against the views of the rigidly doctrinaire railway valuers."

A Mollifying Report.

EVIDENCE continues to accumulate that a saner public judgment is coming to the relief of the New England situation, and that those at present in control of the railway interests, will be given another opportunity to work out the transportation problems of that section.

The most powerful commercial organization of that section, the Boston Chamber of Commerce, has recently emphatically declared itself as opposed to any present disintegration of the system built up under the Mellen regime. To quote the Boston *Transcript*:

"In the light of the report of the directors of the Chamber of Commerce concerning the railroad situation in New England, President Mellen and his directors may well feel that their day of conference in Boston was not without effect; for the report is obviously intended to be mollifying in various directions. The nine recommendations offered by the directors in effect favor extending the lease of life of the present management of the New Haven pending further evidence of its ability to 'make good' and to this end various suggestions are offered which, in the opinion of the directors, 'will bring immediate relief irrespective of the final settlement of some of the questions of public policy involved.' These include the following improvements for the Boston and Maine: more locomotives and cars, better Boston freight terminals, more facilities and better service at junction points, which with additional tracks contemplated by the railroad officials, indicate an outlay of twenty-five million for the Boston and Maine during the next few years.

"Other mollifying suggestions on behalf of the public include an increase of Massachusetts representation on the directorate of the Mellen system; a recommendation to the Legislature to enlarge the authority and increase the resources of the Railroad Commission and the development of traffic with Canadian points.

"For those who were expecting a ringing declaration of public policy toward the railroads the report will prove disappointing. But to undertake to mollify the public, the railroad management and the railroad investor is too large a task to accomplish in the course of a single report, and the directors have obviously sacrificed at several points their opportunity for constructive criticism and specific recommendations in an effort to reconcile conflicting interests within and without their own body. They have tried to prepare a report that would be indorsed by a majority of the members, be acceptable to Mr. Mellen, to the railroad investors, and of some slight service to the Legislature."

Be Cheerful.

WHILE it requires an effort to be cheerful at all times, it seldom fails to pay. So far as its effect upon the relations between the public and the railways are concerned, it becomes a real asset, and as such is generally advocated by railway officials. In this connection, the following notice recently issued by a Western road to its employes, is of interest:

"A good laugh is better than medicine. Learn how to tell a story. Learn how to keep your troubles to yourself. The world is too busy to care for your ills and troubles. Learn to hide your pains and aches under pleasant smiles. Meet everyone with a smile; a good-humored man or woman always is welcome. Above all, give pleasure."

Commenting on this statement the Baltimore *News* says:

"This excellent advice will mean a decided change to the traveling public if it is followed. No people need it more than Americans, caught in the swing and rush that is characteristic of them.

"And it may be added that no class of people need it more than railroad men. The average conductor or brakeman is not, as a rule, cheerful. His loquacity is usually confined to such formal expressions as 'Ticket, please,' and 'Change at Smithtown.' Only a bold passenger, under present conditions, will venture a jest with the powerful and often gloomy individual who can put him off at the next station.

"In these days of change it is pleasant to know that even the despotic frigidity of the man with the ticket punch is not immutable. What a worthwhile world this will be when the noise of the rattling wheels and coughing engine of a passing train will be drowned by the roars of laughter from passengers diverted by the conductor's latest version of 'Why does a chicken cross the road?' A delighted chuckle in the distance will mean the approach of the New York express and a fading chorus of ha-has will mark its departure."

The Philadelphia *Record* also finds comfort in instructions recently issued by the Pennsylvania Railroad to its trainmen to the effect that they shall instruct passengers regarding the cause of delays. It says:

"It must ever be a great mystery why the railroads have not before taken up the reform announced by the 'Pennsy,' that when a train is delayed on the road the conductor shall inform the passengers as to the cause of the holdup and the best means, if any, of continuing their journey. This is sound common sense and will remove a frequent cause of exasperation. The mind of the average passenger has never been able to fathom the mental processes of the ordinary conductor and brakeman in the face of such a contingency. If a freight car has jumped the rails and blocked the track ahead, or if an overheated journal has made it necessary for a passenger train to stop for a short time, thus blocking trains behind it, there has never seemed to be any particular reason why the fact should not be

Digitized by Google

stated simply to an inquiring passenger. Instead of this it is the custom for the conductor to invest himself with all the dignity and reserve of a captain on the bridge of an ocean steamship, and to treat the trivial accident as if it had all the possibilities of a Titanic disaster. If the railroads will cut out more of these absurdities they will add a new pleasure to travel."

The British Prime Minister on English Railways.

THE London *Times* of March 18th contains an interesting account of the audience which the Prime Minister of England gave to a deputation of the Parliamentary Committee of the Trades Union Congress. The Trades Unionists maintained that the Prime Minister should advocate the nationalization of the mines and the railways.

Mr. Asquith maintained that the nationalization of the mines was quite out of the question, but agrees that railways stood on a different footing in that state controlled and interfered with the operation, the rates, and with various other features of the railroads, and that when the railroads were originally built, it was contemplated by Parliament that under certain conditions the carriers might be taken over by the state.

That contingency had always been, at any rate, a possibility which those who invested their money in railway enterprise were invited, and indeed bound, to contemplate. But there were practical difficulties of a very serious kind in the application of the principle of nationalization to the railways. He was quite sure that any such operation, carried out on reasonable and equitable terms, would be immediately followed by very large demands from two entirely different quarters—from the traders in the matter of rates and from the workers for better conditions as to wages and hours of labor. The prospective advance in the net receipts which had been forecast that day very likely might come, but in existing conditions would, he strongly suspected, be swallowed and more than swallowed up before the railways had been in the possession of the state for much more than twelve months. Those were things which, from the point of view of the taxpayer, they could not leave out of account, however great might be the advantages of the diminution of competition and the general coordination of the railway system which might follow from something in the nature of a central management. At any rate, he remained of the opinion that, the burden of proof being on those who favored this proposal, that burden had not, from the point of view of the community, been adequately discharged.

The Manchester Ship Canal of England.

IN the current number of the *Economic Journal*, which is published by the Royal Economic Society of London, Mr. W. M. Acworth, the well known railway expert, has an article reviewing the book recently published in this country by Harold G. Moulton, entitled "Waterways versus Railways." Mr. Acworth points out some very striking facts relating to the Manchester Ship Canal, as follows:

"To Englishmen, the chapter on the Manchester Ship Canal has a more direct interest, especially as most people believe that the results have justified its construction. Mr. Moulton shows that the Canal was estimated to cost £8,000,000. It has cost more than double. It was estimated to pay a 5 per cent dividend upon the whole share capital of £8,000,000 in the second year of operation. In fact, now, sixteen years after its opening, it has never even met the interest on its debt. It was estimated to earn in the second year of operation £479,000 net. In fact, it earned £137,000 gross. Further as to its indirect effects: Manchester shows a growth of population during the decade 1891-1901 less than that of Liverpool and Birmingham, and not half that of Leeds; the reduction in railway rates between Liverpool and Manchetser is 'slight at best.' One might perhaps add that, had the £17,000,000 been spent, not on making a canal, but as a free gift to the Lancashire railway companies, there can be no doubt that they would have agreed in return to carry cotton for nothing, and to give to manufacturers and operatives alike perpetual free passes between Manchester and the pleasure towns of the Lancashire coast."

A Reported Revolution in Steel Manufacture.

THE Philadelphia *Press*, commenting editorially on the recent report from Europe that a new process has been discovered whereby the cost in the manufacture of steel has been greatly reduced, has the following to say:

"Should an announcement from across the Atlantic prove correct—and it is said to emanate from well-informed quarters—the steel industry of the world may be revolutionized in the near future. A process of converting at a relatively small cost iron ore of the lowest grade into steel of excellent quality is said to have been discovered.

"Experimental tests with 'iron sands' and other low grade substances have demonstrated to the satisfaction of steel manufacturing experts, according to the despatches, that an enormous saving of money can be secured by the cheaper mode. This will be augmented by the vast quantity of material now lying waste which, it is asserted, is capable of being smelted without the aid of a blast furnace, and made steel direct in a single operation. No details are given beyond the general statement that the rough ore is reduced by heat from a gas produced from the slag, at present a useless by-product.

"The economy of manufacture combined with the utilizing of basic material now unmarketable promises the introduction of a new era in the manufacture of steel. It is claimed for the new process that good steel can be produced at one third of its present cost. Should further investigation confirm these claims, the discovery mooted will be hailed amongst the triumphs of a swiftly progressive age. But Pennsylvanians interested to a stupendous degree in any new process of making or hardening steel will wait for fuller information before passing judgment on the alleged invention."

Looking Into the Future

By B. A. WORTHINGTON,
PRESIDENT, CHICAGO AND ALTON RAILROAD.

B. A. WORTHINGTON.

DURING the past half century the railroads have been developing the resources of this country in a perfectly natural way. That certain abuses have crept into their methods is not at all surprising, for wherever active competition exists we shall always find abuses of a more or less serious nature; and when the apparently ideal methods of small business are applied by a sensitive, active, alert organization to a business having a net capitalization of $1,400,000,500, relatively unimportant shortcomings are wonderfully magnified and assume unusual significance. Yet during this period of rebating, discrimination and kindred evils, the wealth of the United States increased from $7,000,000,000 in 1850 to $107,000,000,000 in 1904, $65,000,000,000, or over half of this enormous wealth, having been developed during the last twenty-four years of this period, while the pernicious practices so often referred to were under full sway. From this point of view the matter of rebating, etc., dwindles to relative insignificance, for we must bear in mind that this enormous wealth is *substantial* wealth, invested in the gilt-edged securities of farm lands, city property, industrials and public utilities, all enhancing in value dependent entirely upon future development of the railroads.

But I hold no brief for the rebating system or discriminatory practices. No right-thinking railroad man in the country is but thankful that these days of extortion are passed forever. Nor do I claim that railroad business methods or conditions are yet perfected, but in justice to the sensitive economic features involved, I do plead for the most careful premeditation, and that should doubt arise in regard to any features, it should be carefully hedged in with all the proper safeguards of public welfare, bearing in mind the all-important lessons in history, and that economic and natural laws are always superior to statutory enactments and must not be disregarded.

MEETING CONDITIONS OF THE FUTURE.

The railroad situation at the present time is as delicate as it is complex. In the decade 1890 to 1900 the volume of freight traffic handled by the railroads was doubled, and in the following decade it was doubled again—and still the end is not in sight. Our farms are yielding but a small proportion of the crops that are possible by intensive cultivation. The density of our population is less than 31 persons to the square mile, while the population of the United Kingdom is 373 and that of Belgium 660 to the square mile; and if we project a line into the future from the point which we have established in the past, we cannot misapprehend the further development which lies directly before us.

But whether the volume of business increases or whether it decreases are speculative conditions, alike threatening to the railroad situation. An increase in the volume of business is an absolute necessity under present conditions of reduced net earnings per unit of service, but to provide facilities to handle an increased volume of business is a financial impossibility unless new capital can be induced to enter the field of railroad investment.

In referring to this phase of the question, Howard Elliott, president of the Northern Pacific Railway, a man who has fought his own way from the humblest ranks to this position of eminence, stated in a recent address that there should be $1,700,000,000 new capital put into the transportation business of the United States each year for the next five years—a total of $8,500,000,000, or 60 per cent of the present calculated value of all our railroad property. This practically amounts to reconstruction throughout in order to handle the business now offered and make suitable provision for what we *know* is ahead of us. This means the replacement of obsolete equipment, the elimination of grades, double-tracking, safety appliances, also innumerable non-productive improvements, such as the elimination of grade crossings, modern station facilities, etc., demanded by the public—in short, better and safer transportation throughout.

The expenditure of $1,700,000,000 new capital each year for the next five years would not mean that the wealth of this country would be decreased to this extent. Far from that! It would mean that this amount of money would be spent for labor and materials right here at home, and every cent of it would revert to the people in the most satisfactory forms acceptable to them. What a glorious vision of prosperity this presents!

GOVERNMENT REGULATION NOT OBJECTIONABLE.

The original founders of our railroad systems, visionary though they may have been and doubtless were, could never have thought possible the wonderful development and the amazing prosperity of the past twenty years. History presents no precedent, simply because the possibilities of transportation have never before been so thoroughly exploited. Neither could this development

Digitized by Google

have been possible, save for the acute business instincts of private ownership of railroads and the widest freedom of individual initiative, neither of which could survive government ownership or government operation.

Government control is not at all objectionable to the railroads; in fact, it is a necessity; and its restraining influences are entirely wholesome. In many respects the government has already produced results which the railroads could never hope to accomplish—such, for instance, as the elimination of rebating and other discriminatory practices inherent to active competition, all of which practically have been abolished from the sphere of railroad operation.

But in paring down the claws of this alleged monster, the railroads—a regular Chinese dragon to those less familiar with their economic and strategic uses, still the same sacred carrier of burdens and the emblems of progress that our ancestors worshiped forty centuries ago—they have cut into the quick, and until the wound heals by natural processes, progress will be crippled. In taking away from the railroads the prerogative of rate making and by prescribing numerous restrictive conditions of operation which tend to reduce revenue and increase expenses, they have taken away from the railroads their natural weapons of offense and defense, and have left the railroads apparently at the mercy of an unsympathetic public, which, laboring under grave misapprehension, sees nothing but misdeeds, naturally, artificially and oftentimes maliciously, magnified.

Railroad Facilities Inadequate to Meet Requirements.

Owing to this unfortunate state of affairs, the railroads of the United States have now reached a stage where they are unable to provide adequate terminal facilities where they are most urgently required, and where congestions recur annually, lasting for months at a time, regardless of the extreme shortage of equipment. The steadily decreasing margin of safety in railroad operation, amounting to substantially 28 per cent in the past ten years, has made it compulsory upon the part of the railroads to cut maintenance charges, and accordingly the physical property—roadway and rolling stock—has in many instances been sacrificed to produce even these results, and visions of the future have become obscured by the run-down conditions of to-day.

Railroad vs. Industrial Return on Investment.

Turning from this unpleasant aspect, in the shadow of the gloom which has fallen upon the railroad situation the investing public looks askance at the red figures in income account, like fire destroying property values, and turns reluctantly to industrials, where obscurity seems to promise security, where the net return upon capital invested is more than twice as great as in railroads, where the public is not a factor to consult, and where the government is in no wise sponsor for results.

That the railroads should expect to share in the general prosperity of their own making is not surprising—excepting that the railroads yield but 5.7 per cent upon investments, while manufactures yield over 12 per cent, and the value of farm land and city property is appreciating in value so rapidly that comprehensive data is not available. In view of the risks assumed in railroad undertakings, the developments which they have always encouraged, and the excellent service which they are rendering to the public even under the present restrictive conditions, it would appear that more encouraging results should be possible along this line of investment, as a more substantial guaranty of public safety, financially and commercially. The suggestion that railroad investments should earn as much as investments in manufactures, for instance, is not out of order, because the right to earn a reasonable profit upon legitimate investment is all that is asked for, and the improvement of railroad property and the enlargement of its facilities is a matter of urgent public necessity. This menace of financial impossibilities thrust upon the railroads should be speedily removed as a restraint to commerce, which in fact, it is, and in no small measure.

Dividends on Railroad Stocks.

In the matter of dividends on railroad stocks, the impression seems to prevail that a dividend of, say 7 or 8 per cent on stock would be equivalent to throwing that much wealth into the sea, when in fact, it would merely revert to the people—to the widows, orphans, business men, financial and endowed public institutions, where it would be reinvested immediately in one highly desirable form or another. Certainly this would be no crime. It would be an economic condition much to be preferred to the closed shop, with roundhouses standing full of crippled locomotives, yards filled with bad-order cars, roadway neglected because of financial stringency, and wasteful congestions prevailing—all resulting in unsatisfactory service to patrons, unsatisfactory results for the railroad managers, and a passing of dividends for the shareholders. The question is who *does* get any benefit from this condition of affairs.

Railroad Securities Held Abroad.

Another phase of this question, one which should cause the deepest reflection, is the fact that from 20 to 25 per cent of our railroad securities are held abroad. With private ownership of railroads as it exists to-day, it is useless for the government to attempt to evade the responsibility for the depreciating values of these securities, which are being returned to us under protest. Our "commerce laws" originally were enacted for the protection of bona fide investors in railroad securities and to prevent practices that could not be measured by a strict code of business justice, and if we would avert national dishonor, more undesirable than anything else that could happen, we should be ever conscious of this delicate situation and leave nothing whatever undone to satisfy in the fullest measure our pledges of faith held abroad.

The armies and navies of the world have always existed primarily for the protection of commerce. Relentless wars have been waged, and shall yet be waged, because of conditions that affect national wealth and national welfare, and nothing affects national wealth and national welfare as do conditions of commerce.

No individual has ever knowingly sought to destroy a source of his income, but he will fight, and fight to the death, to preserve it. Nations are merely groups of individuals, none the less sensitive and responsive to these same conditions, and as long as foreign capital invested in American railroads yields just and satisfactory returns to the strong financial institutions of Europe, their

Digitized by Google

dogs of war will ever remain chained up at home, American railroad securities will be our national security—not the misnomer they seem to be to-day—and the International Peace Conferences at The Hague will be merely a waste of effort so far as America is concerned.

This condition of affairs is peculiar to America alone. It is one of our most valuable assets, the most formidable defense that any nation has ever erected. Let us not tear it down with our own hands.

Moreover, we are now approaching the time when it will be possible to materially strengthen this position, when securities must be floated for the $8,500,000,000 which should, and must, be put in our transportation system within the next five years, and we cannot afford to ignore the opportunity that is now knocking at our door.

Judge Knapp and Commissioners Lane and Prouty Agree.

In this tangled web of conflicting conditions now lying before us, I believe that the ends have finally been gotten together. I believe the crisis is passed—even perhaps as our eminent authority, Mr. Lane, expresses the thought respecting government ownership: "That stage of despair, or resolution, we have not yet reached."

In his fine, deliberate, cautious manner, possibly the question of government ownership and operation of our railroads may have slipped by unobserved and into oblivion with the changing of his own attitude upon this point. Let us hope that it has.

In the beginning of this article to which I have referred, Mr. Lane states in regard to the personnel of the Commission:

"It would be hard to find seven men who differ more in temperament, in training, or in type of mind, than the present commissioners. We differ as one leaf from another in our political sympathies. Often we do not arrive at our conclusions from the same strategic angle."

Yet it is worthy of note that Mr. Lane's predecessor, the Honorable Charles A. Prouty, ex-chairman of the Interstate Commerce Commission, a man who, like Mr. Lane, has made a life-long study of the perplexing railroad problems, has stated:

"If the time does come when railroad property is sacrificed to public clamor, when the public demands its confiscation and the regulating tribunal concedes that demand, no property will be of much value. The day will have come when the obligation of private rights is no longer observed."

The Honorable Martin A. Knapp, likewise an ex-chairman of the Interstate Commerce Commission, a tireless student of the railroad situation, and one of the most profound thinkers in this country, expresses his thoughts as follows:

"I should regret to see the government take up the business of owning and operating our railroad lines."

It would, therefore, seem that these three able analysts, individually and by different methods, have arrived at about the same conclusion—that the square of commercial condition cannot be made to fit satisfactorily into a theoretically perfect circle of public ownership.

When this question is finally and definitely disposed of, we may proceed more understandingly and along more scientific lines to pursue the cause of higher civilization.

Railroad Men May Be Relied Upon to Aid Commission.

The clarifying of the railroad situation may yet take years to accomplish, for it must necessarily be a slow and careful procedure; and in the efforts of the Commission to untangle this web of misunderstanding and misdirected efforts no right-thinking railroad man, no public-spirited man, whatever may be his calling, should withhold his fullest support and his warmest encouragement. The railroads, having nothing to fear, I am sure will, as a unit, welcome and enthusiastically embrace the opportunity to work in full harmony with the Commission and for the common cause of the people, including not only patrons of railroads and railroad employes, but also the holders of railroad securities and the public generally—a happy solution which in itself will contain all that is desirable in government ownership or operation, and yet will maintain the constitutional rights of private property and preserve the spirit of industrial freedom and the incentive for individual initiative which in the past twenty-four years have wrought a stupendous wealth, regardless of all our shortcomings.

Looking into the Future.

That we are nearing a satisfactory solution of this entire railroad problem, I am convinced. The fact is clearly demonstrated by the three opinions herein cited, those of the three ex-chairmen of the Interstate Commerce Commission, each arrived at entirely independently of the others and very probably from entirely different strategic angles.

Furthermore, in stating his views before the Traffic Club of Pittsburgh less than a year ago, the Honorable Charles A. Prouty used the following language:

"No form of investment to-day is, and no form of investment in the future will be, more certain than railroad stocks and bonds. * * * * The worst that could happen to the stockholder of any of our great railway systems would be a temporary suspension of dividends, and even this could occur only under very unusual circumstances."

In view of the unanimity of opinion and the unqualified assurances emanating from an undisputed authority, the Interstate Commerce Commission, I feel confident that the reins of the situation are in careful hands and that we will yet be able to demonstrate the truth of the assertion that "the degree of civilization enjoyed by a nation IS measured by the character of its transportation facilities."

Therefore, with a full knowledge of what we are trying to do, conscious of the tremendous task before us, and the wonderful possibilities that are contingent upon the *correct* solution of the present-day railroad problem, now is not the time to lament what has happened, or what may have happened in the past, but with unwavering faith in the wisdom and integrity of our able Interstate Commerce Commissioners, generals of the greatest army that ever entered a field of conquest, let us set about to build our bridges into the future—bridges big enough to span any depression which we might encounter in the commercial conditions before us, bridges strong enough to withstand the test of prosperity which we have already sighted over the established points of the past.

Railway Developments in the United States During 1912

By SLASON THOMPSON,
DIRECTOR, BUREAU OF RAILWAY NEWS AND STATISTICS.

THE salient features of the Railway Statistics of the United States for the year ending June 30, 1912, just issued by the Bureau of Railway News and Statistics, Chicago, is that in a year of unprecedented gross earnings the margin of safety left after paying operating expenses was relatively the smallest on record. In cold figures this is compressed in the following statement:

Gross earnings	$2,870,736,000	100.00
Expenses and taxes	2,111,071,000	73.54
Net earnings	759,665,000	26.46

The conditions of which these percentages are the irreducible epitome are thus summarized in the report:

To the railways of the United States the year 1912 has brought:

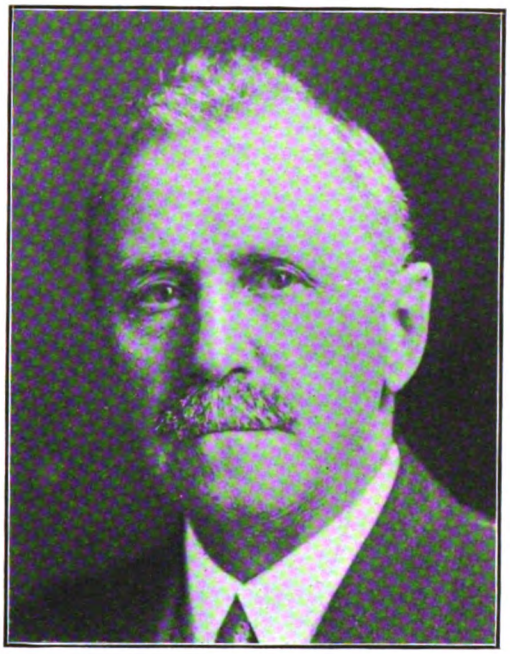
The lowest average freight receipts since 1900,
The highest wages in their history,
The multiplication of costly regulation,
The heaviest loss and damage claims on record,
The highest taxes yet levied,
The largest gross revenues received,
The largest expenses of operation paid, all resulting in
The lowest relative *net* income in 25 years.

To these might have been added the greatest mileage on record, given as 248,888 miles of line and 370,317 miles of track; the most efficient equipment on record, consisting of 62,291 locomotives, averaging nearly 80 tons without tenders; 51,306 passenger cars, and 2,243,465 freight cars of an average capacity of nearly 38 tons against only 28 tons ten years ago.

Following the report somewhat in detail, it appears that the United States has nearly 249,000 miles of railway against only 207,447 for all Europe, including the British Isles, resulting in our having 8.34 miles of line per 100 square miles of territory to Europe's 5.5 miles and one mile of line per 382 inhabitants, where Europe has 2,180. This means that we have fifty per cent more railway mileage relatively to area than Europe, and nearly six times more per capita.

The report shows that American locomotives, without tenders, average over 50 per cent heavier than German locomotives with tenders, the figures being 78.7 and 51.8 tons respectively. The average capacity of American freight cars is 37.5 tons against 13.7 tons on German railways—the largest in Europe.

The statistics of railway employes and their compensation are especially interesting. The number is given as 1,728,603, whose compensation for the year amounted to $1,268,978,000. It is a noteworthy fact that where the number of employes has increased only 3.4 per cent since 1907 their compensation has increased 15.6 per cent. From the tables it appears that the average daily compensation of all railway employes has advanced from $2.07 in 1905 to $2.44 in 1912. In the meantime the average daily pay of enginemen has increased from $4.12 to $5.02; of firemen from $2.38 to $3.03; of conductors from $3.50 to $4.20, and of other trainmen from $2.31 to $3.02. These figures are worth studying in view of pending demands for increased pay by the classes named.



SLASON THOMPSON.

Between 1900 and 1912 the ratio of the railway pay roll to gross operating revenues rose from 38.82 to 44.20, which in itself is enough to account for the shrinkage in the margin of safety between operating expenses and revenues.

In the meantime the ratio of taxes to operating revenues rose from 3.24 per cent to 4.21 per cent.

Where the average pay of American railway employes is $733 per year, that of British railway "servants" is $333; of German $388; of Austrian $277; of French $260 and of Russian $196. An English engine driver averages $11.16 per week, where the American locomotive engineer averages over $5 a day.

Tables are given showing that the pay of railway employes has increased more rapidly than relative prices of the principal articles of food, the comparisons being made with the average for the years 1890-1899, as prepared by the Bureau of Labor. In contrast with these advances, the average receipts per mile per passenger and per ton are shown to have declined, the average for the latter being 7.41 mills, which is the lowest average since 1901.

It is this decline in the average freight rate, in conjunction with the advance in the cost of labor and all materials entering into the operation of railways and the increase of nearly one per cent in the rate of interest, that prevents the railways sharing in the general prosperity. To them is shifted the burden of fetching and carrying for a progressive people of 100,000,000 at prices which yield a decreasing margin of profit. Increased and more efficient facilities are demand-

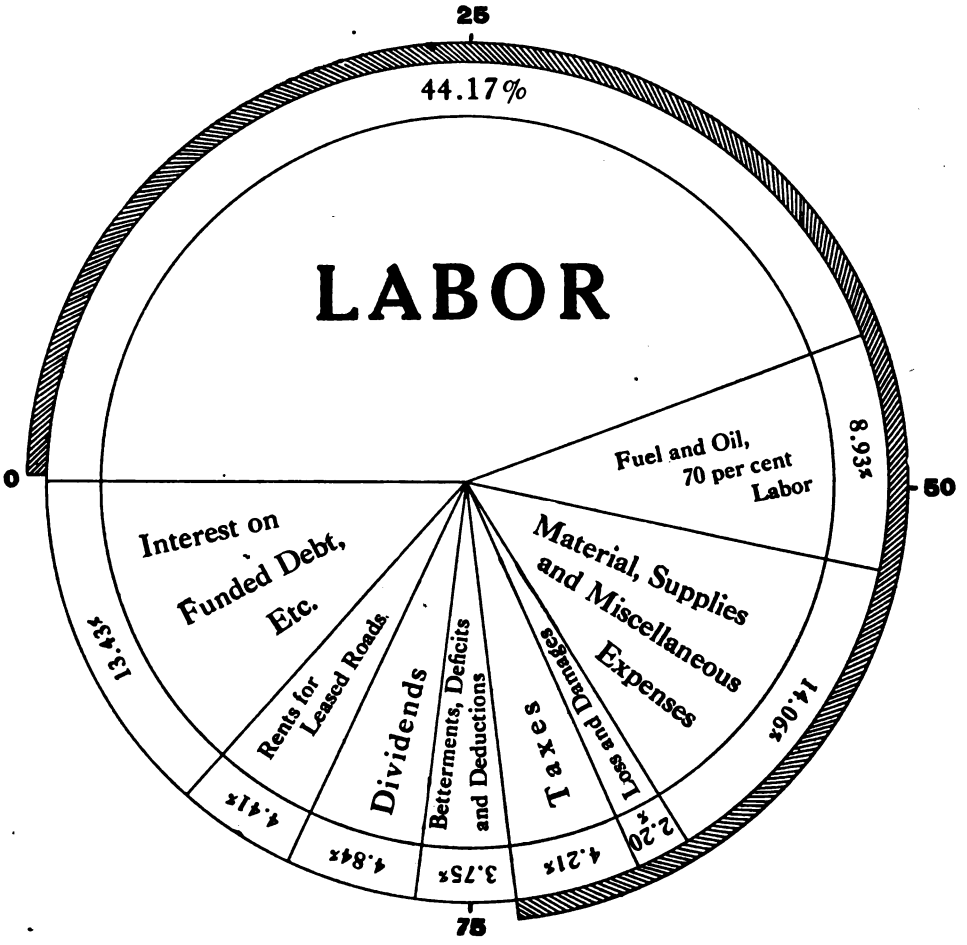
What Became of the Railway Dollar in 1912



ed while the means of providing them are being nibbled away by hostile federal and state regulation and exactions.

The net capitalization of the railways of the United States for the year 1912 is given as $14,657,545,069, equal to $61,508 per mile of line, or only $41,204 per mile of track. The gross capital represented by funded debt and stock amounted to $19,694,987,553, of which $5,037,442,484 was duplicated in railway bonds and stocks owned by the railway companies.

Figures are given showing the capitalization of European railways, that in the principal countries being:

	Per mile.
United Kingdom	$275,354
Belgium	187,787
France	143,648
Italy	126,886
Austria	117,837
Switzerland	116,692
Germany	113,326
Portugal	110,830
Russian Empire	80,902

The average for all Europe, including Asiatic Russia, is $121,453. If American railways were capitalized as high as British roads, it would take their entire revenues at present rates to pay 4¼ per cent on the investment. Although the cost of British roads originally was extravagant, over $100,000 per mile has been added to their cost since 1870 by the British practice of distributing every last penny of net revenues and charging the cost of every spike or cubic foot of additions and betterments to capital account. The difference between the present capitalization of American and European roads is a demonstration of the soundness of the American principle—a dollar for improvements to every dollar for dividends. All roads have not lived up to this principle, but those that have most nearly approached it in practice are the financially sound roads to-day.

So far as has been ascertained, only $242,145,100 new capital was invested in American railways in 1912.

The report shows that where the average receipts of American railways in 1912 were only 7.41 mills per ton mile, those of the leading European railways were—United Kingdom 23.30 mills; Germany 14.10; France 13.9; Austria 14.5;

Digitized by Google

Sweden 22.30; Holland 13.2 and Switzerland 29.10.

In 1912 only 1.8 per cent of railway revenues were derived from carrying the mails, against 2.31 per cent ten years ago and 2.6 per cent from express. The injustice of the Government's treatment of the railways in the matter of pay for carrying the mails is demonstrated by the fact that where its own postal revenues since 1902 have increased 101.7 per cent, those of the railways for performing a more expensive service have increased only 28.8 per cent. As a matter of fact the service costs more than $25,000,000 annually more than is paid for it.

The railway bill for damages to property and injuries to persons in 1912 was $61,838,136—absorbing 2.2 per cent of the revenues, both actually and relatively the largest on record.

The Introduction to the report brings the income account of the railways down to the end of the calendar year 1912, which may be summarized as follows:

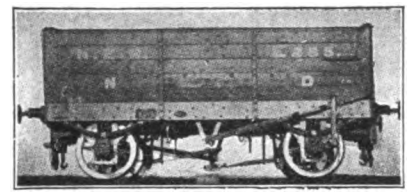
INCOME ACCOUNT CALENDAR YEAR 1912.

Operating revenues	$3,036,076,418
Operating expenses	2,092,297,214
Net operating revenue	943,779,204
Profit from outside operations	1,710,130
Net revenue	$945,489,334
Taxes	125,753,235
Net operating income	$819,736,099
Per mile of line	$3,305
Per mile of line 1911	3,157
Per mile of line 1910	3,345
Per mile of line 1909	3,460

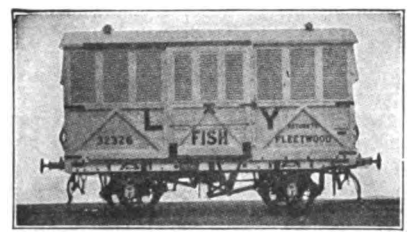
From these figures it appears that with phenomenal revenues (passing the three billion mark) and unprecedentedly favorable operating conditions during the second half of the year, the net operating income of the railways per mile of line was less than in 1910 and 1909, while the ratio of expenses and taxes to revenues was still over 73 per cent, whereas 70 per cent is the line of safety.

The Introduction also presents an analysis of the decisions of the Interstate Commerce Commission and of the finding of the Board in the Engineers' Arbitration case. During the year the Commission handed down 375 decisions of which 243, or 64 per cent, granted reparation or reductions of rates with no increases. It also entered 3.332 reparation orders "all tending to deplete railway revenues." Of the hundreds of tariffs filed advancing rates, the vast majority are held up for from 120 days to ten months and the formal decisions of the Commission show less than 50 suspensions vacated.

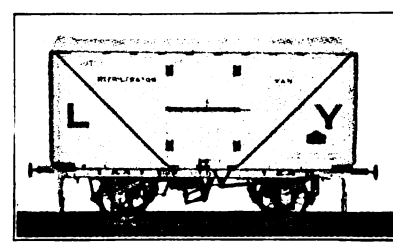
In regard to the award of the Arbitration Board, it is shown that this was not made on the merits of the case but to avoid the strike the threat of which led to the submission of the differences to arbitration. The engineers, constituting the highest paid class of railway employes, asked for more pay. They voted to strike if their demands were not acceded to, and they were given half a loaf in the form of a minimum wage of $4.25 to $5 per day equal to the average wage of the territory in which they worked despite the fact some of the roads are financially unable to pay any increased compensation.



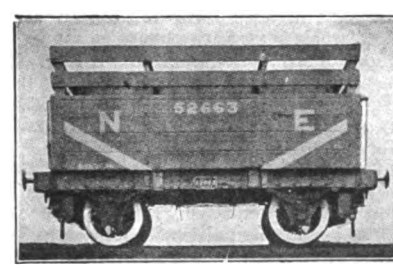
10½-TON COAL WAGON.



10-TON FISH VAN.



7-TON REFRIGERATOR VAN.



8-TON RAILED COKE WAGON.

The photographs herewith presented allow the reader to form some conception of the miniature character of British rolling stock compared with that with which he is familiar on American roads. When it is considered, for example, that the Norfolk and Western Railway has recently completed and put in service, a gondola coal car of 90 tons capacity, the tremendous economy and efficiency of the rolling stock of the railroads of this country, will be appreciated. This, it may be noted, is only one branch of a transportation service which is not equalled or even approached in any other part of the world.

Railway Developments in Canada During 1912

THE returns for the steam railways in Canada for the year ended June 30, 1912, issued by the Comptroller of Railway Statistics, J. L. Payne, show that there were 26,727.23 miles of railway in operation, an increase of 1,330.37 miles over June 30, 1911. Of this increase over 83 per cent took place in the four Western provinces. In addition to this increase of mileage in operation there were 1,622.50 miles of line, chiefly Grand Trunk Pacific Railway, in operation, which are still regarded officially as being "under construction." In addition there are 1,752.49 miles of second track (an increase of 142.53 miles), and 6,148.92 miles of yard track and sidings (an increase of 599.39 miles), making a total of 34,629 miles of all tracks in operation, against 32,559 miles on June 30, 1911. Of the 8,825.80 miles of track dealt with as being under construction, 1,622.50 miles were in operation, 1,738.04 were completed, 3,990.76 under contract, and 1474.50 were ready to be placed under contract. The railway mileage in operation in the several provinces, as compared with June 30, 1911, was as follows:

	Miles.	Miles.
Ontario	8,545.56	8,322
Quebec	3,882.61	3,882
Manitoba	3,520.42	3,466
Saskatchewan	3,753.85	3,121
Alberta	1,896.64	1,494
British Columbia	1,854.53	1,842
New Brunswick	1,545.10	1,548
Nova Scotia	1,357.48	1,554
Prince Edward Island	269.33	269
Yukon	101.71	102
Total	26,727.23	25,400

A difference of 3.50 miles is made in New Brunswick in correction of an error in the returns of the previous year.

The total capital liability was $1,588,937,526, of which $770,450,351 represented capital stock, and $818,478,175 funded debt. This is an increase of $21,251,664 in stocks, and $38,996,661 in funded debt, a total of $60,248,325 in the year. By eliminating the mileage of Government railways and duplication in stock and bond issues the capital liability represents $50,832 a mile, a relatively low figure. The total amount paid in dividends on capital stock was $31,164,791, equal to a rate of 4.04 per cent, as compared with $30,577,740, equal to a rate of 4.08 per cent paid for the year ended June 30, 1911. Of the dividends $18,487,000 was paid on common stock, and $12,677,791 on preferred stock.

The cash aid given during the year totaled $5,842,818.34, of which $5,858,163.34 was paid by the Dominion Government, $26,115 by the provinces, and $8,500 by municipalities. The great difference in the amount paid by the Dominion Government over 1910-11, is accounted for by the payment of $4,004,416.34 paid to the Grand Trunk Pacific Railway, under the "implementing" clause of agreement guaranteeing its bond issue. These figures bring the amount paid in aid of railway construction by the Dominion Government to $154,075,235.09; by the provincial governments to $35,045,515.16, and by municipalities to $18,051,323.60. In addition land grants by the Dominion (discontinued since 1894) and the Provinces have aggregated 50,052,055 acres, and bonds guaranteeing $245,070,045 of bonds have been given by the several governments as follows:

Dominion	$91,983,553
Manitoba	20,889,660
Alberta	45,489,000
Saskatchewan	32,500,000
Ontario	7,860,000
Nova Scotia	5,022,000
British Columbia	38,946,832
New Brunswick	1,893,000
Quebec	476,000
Total	$245,070,045

An increase of $96,733,688, as compared with the amount outstanding June 30, 1911.

The earnings from all sources aggregated $219,403,753, an increase of $30,670,259, or 16.2 per cent in the year, the source of revenue being as follows:

	1910-11.	1911-12
Passengers	$50,566,894	$56,543,664
Mails	1,869,414	1,914,720
Express	4,674,135	5,294,388
Baggage, parlor cars, etc.	1,207,555	1,295,415
Freight	126,570,534	149,961,140
Station and train privileges	826,252	1,086,687
Telegraphs, rents., etc.	3,018,710	3,307,739
Total	$188,733,493	$219,403,753

The operating expenses were $150,736,540, or 68.7 per cent of the gross income. The total increase in operating expenses was $19,691,494 in the year, the distribution of the same, with the comparative figures for 1910-11, being:

	1910-11.	1911-12.
Ways and structures	$29,246,093	$31,514,098
Equipment	26,127,638	29,811,510
Traffic expenses	4,831,744	5,293,700
Transportation	66,343,269	78,969,544
General expenses	4,487,039	5,137,688
Total	$131,034,784	$150,736,540

The railways carried 41,124,181 passengers and 89,444,331 tons of freight, an increase of 4,026,463 passengers and 9,560,049 tons of freight over 1910-11. The following tables give general statistics regarding traffic:

Passenger Traffic.	1910-11.	1911-12.
Number of passengers	37,097,718	41,124,181
Passengers carried one mile	2,605,968,924	2,910,251,636
Passengers one mile per mile of line	102,597	108,888
Passengers per mile of line	1,460	1,539
Average passenger journey (miles)	70	71
Average number of passengers per train	60	62
Passenger train mileage.	36,985,911	40,440,393
Mixed train mileage	6,277,468	6,473,882
Earnings from ticket sales	$50,566,894	$56,543,664
Earnings from passenger service	$58,317,998	$65,048,187
Average receipts per passenger	$1.360	$1.375
Average receipts per passenger per mile (cents)	1.944	1.943

Freight Traffic.	1910-11.	1911-12.
Tons hauled	79,884,282	89,444,331
Tons hauled one mile	16,048,478,295	19,558,190,527
Tons hauled one mile per mile of line	631,829	731,776
Average haul, miles	200	218
Freight train mileage	52,498,866	60,126,023
Mixed train mileage	6,277,468	6,473,882
Revenue from freight	$124,743,015	$148,030,269
Average tons per train	305	325
Average car per train	18.03	18.19
Average tons per car	16.91	17.87
Average receipts per ton per mile (cents)	.777	.757

Digitized by Google

The freight tonnage was divided by classes as follows:

	1910-11.	1911-12.
Products of agriculture .	13,809,536	17,300,945
Products of animals ...	3,190,702	3,159,280
Products of mines	28,652,236	31,467,799
Products of forest	13,238,347	14,152,721
Manufacturers	13,573,987	16,241,081
Merchandise	2,438,089	2,711,963
Miscellaneous	4,981,385	4,410,552
Total .....Tons	79,884,282	89,444,331

Further details of earnings and operating expenses are as follows:

	1910-11.	1911-12.
Gross earnings	$188,733,494	$219,726,540
Net earnings	57,698,709	68,677,213
Gross earnings per mile.	7,430.45	8,209.94
Net earnings per mile..	2,271.60	2,569.58
Earnings per passenger.	1.363	1.375
Earnings per ton	1.561	1.655
Earnings per passenger train mile	1.348	1.390
Earnings per freight train mile	2,376	2.494
Earnings per train mile, all trains	2.103	2.174
Operating expenses	131,034,785	150,726,540
Operating expenses per mile	5,158.85	5,639.48
Cost of running trains per mile	1.460	1.493

TRAIN MILEAGE.

	1910-11.	1911-12.
Passenger trains	36,985,911	40,440,393
Freight trains	46,220,813	53,652,141
Mixed trains	6,277,468	6,473,882
Special trains	232,341	363,855
Total	89,716,533	100,930,271

FREIGHT CAR MILEAGE.

	1910-11.	1911-12.
Loaded freight cars	946,946,917	1,102,719,543
Empty freight cars	311,984,866	310,974,528
Caboose cars	47,834,318	55,692,091
Total	1,306,766,101	1,469,386,162

There were 4,484 locomotives, 4,946 passenger cars, 140,918 freight cars, and 10,466 company service cars in the service of the several companies, against 4,219 locomotives, 4,513 passenger cars, 127,158 freight cars, and 9,579 company service cars on June 30, 1911. In addition 181 locomotives and 7,593 cars were reported as being leased at June 30, 1912, and fast freight lines had 265 cars in service.

LOCOMOTIVE MILEAGE.

Freight	57,143,590
Passenger	40,944,058
Mixed	7,742,514
Switching	21,159,394
Special	411,924
Total	127,401,480

The locomotives consumed 7,783,736 tons of fuel, chiefly coal, at a cost of $24,160,823. The use of oil as a fuel is reported for the first time officially, 1,729,577 gallons being used during the year.

The returns of accidents show that 568 persons were killed and 3,780 injured, an increase of 73 in the number killed and of 451 in the number injured, as compared with 1910-11. There were 545 persons killed and 2,437 injured by the movement of trains, distributed as follows:

	Killed.	Injured.
Passengers	47	485
Employes	215	1,606
Trespassers	235	193
Non-trespassers	48	120
Postal clerks and others	..	33
Total	545	2,437

One passenger in every 872,855 was killed, and one in every 84,792 was injured, as compared with one in every 1,324,919 killed and one in every 124,487 injured in 1910-11.

The number of railway employes on June 30, 1912, was 155,901, against 141,224 on June 30, 1911, and the aggregate salaries and wages was $87,299,639, an increase of $6,937,984.

Fifteen million ties, costing $6,700,000, were used during the year; the amount paid in taxes increased from $1,792,390 to $2,200,529, and 3,544 miles of line were operated by telephone, an increase of 238 miles over that so operated in 1910-11.

A Plea for Common Sense Applied to Railroads

By WILLIAM MCCOMB.

FOR long it has been highly fashionable throughout the entire country, to criticise, berate and attack the transportation interests. In fact, within the past few years, the passport to political preferment has been through the advocacy of restrictive railway legislation.

We do not carry a brief for the railroad interests, but we do plead a return to business sanity and common sense, and to an appreciation of what the railroads have meant, now mean, and must in the future mean to the prosperity of the whole country.

We have reached a point in our thinking where we have lost the true perspective and no longer regard transportation as a part of the composite whole of our industrial and commercial life. The people of all classes and every business have come to look upon the railroads as a tremendous something whose sole aim is to abstract the largest amount of tax from the public.

No one to-day, not even the railways and their managers, would attempt to deny that the railroads themselves, in the past, had something to do with bringing this line of thought into the public mind. Reading the history of transportation, it is impossible to absolve the railways, in their early history, from blame. There were no doubt in the past abuses and injustices practiced on the people by the railway managers, and perhaps to-day, there are men identified with the railways, as there are in every line of business, who would take unjust advantage, and who have no commercial conscience, but it is safe to say that men of this type are no more in the majority in the railroad world than in any other line of activity. Men of this kind have, and always will be found everywhere. No one can afford to become pessimistic and condemn the entire business world because of these men.

Measured in the light of history, power transportation is yet in its swaddling clothes, and in America, the land beyond all other of magnificent

Digitized by Google

distances, community development necessarily has depended so much on railway construction that the very speed of its growth prevented symmetrical development and the establishment of usages that come in the course of time to all occupation.

In the light and life of the hour we are prone to forget the important part transportation has played in the development of this country, and, usually, we do forget the part it must yet play. America's ninety odd millions of population is the direct product of our stupendous railway building. Without the men of hardihood and courage, who, with prophetic vision, pictured the wealth, wonder and growth of the nation to-day, and who brought the fruitation of that vision through their money, strength and genius, this result would not have been possible and the vast resources of our nation's wealth in agriculture, mines, manufacturing, and attendant commerce, would not have been. Yet with it all we stand to-day at the dawn of a to-morrow, holding as bright promise as that of yesterday, and there is as great a future for the higher development of transportation, not alone in the wild reaches of this country, but in every other state, as there was twenty-five years ago.

Many of the abuses of railroading were the quite natural consequences of the rapid development that has taken place in this nation. Mistakes were made consequent upon thoughtless, reckless building, the duplication of lines, the building into partially settled territory, in the hope that development might follow there, with the same rapidity that took place in more favored sections. As a consequence, the wild scramble for business, obtained by any method, in order to supply lines builded ahead of the demand or duplicated, was but a repetition of conditions in every other class of business. The hope for profits in every line of manufacture has caused unwarranted competition, with the consequence of unwarranted prices that have spelled bankruptcy to thousands.

We have, however, in thinking of railroads, classified them by themselves, set them apart, and pretended that they were not subject to the same economic laws as other business, and unfortunately our regulatory legislation, while beneficial in the main, has been drawn with that spirit in mind.

The correct view of a railroad is that it is a manufacturing plant, that its right of way, terminals and tracks are its factory, its motive power and rolling stock, its tools and machinery, its raw material is the commerce coming to it, and its product is the transportation furnished. This is literally true, as much as a bushel of potatoes is the product of the farm or the steel rail the product of the steel mill, yet to the moment there has been no legislation passed based upon this idea.

We have declared, by our acts, if not by our words, that railroads were not producing a product that was subject to the law of supply and demand, but rather have we said that the railroads are public servants, in which we have a proprietary interest, by reason of their necessity and our dependencies upon them, and in exchange for the fiction of eminent domain, we demand a supervisory direction of their affairs that they may supply us at all times the largest amount of service for the lowest recompense insuring freedom from the sheriff's office.

Railroads can only be built with money. This money can only be obtained in the beginning through voluntary capitalization of stock and bonds, and for improvements and extensions through earnings or additions to capital. If through earnings, then the rates charged for the transportation, the product of the rails and cars, must be large enough to offer a fair return. If through capital enlargement, then the conditions of the railroad business must be such that it will promise sure and adequate returns to the investor, free from the harrowing of agitators.

If we apply this test to the state and interstate railway legislation do we find to-day any consistent course having been followed to insure this end? The statute books and court decisions answer the question in no uncertain terms. Rather has our legislation been destructive than constructive. Rather has its aim been to regulate in a paternalistic manner for the patron to-day, than to make possible the development of the transportation business of to-morrow. We are standing still in railway building, and the development of railway facilities. Regulation has resulted in restriction, and when the demand has come for increase in facilities, or the building of new lines for the development of new territories, the treasuries of the roads are empty and the uncertainty of profits and the unkind attitude of the public make the task of selling securities difficult, if not impossible.

By our legislation predicated on this protecting theory only as applied against railways, we have killed the goose that laid the golden egg, and the pocketbooks of those that opened so freely in the past to purchase railway securities, have been closed. Transportation to-day is the only line of business that cannot take advantage of a higher price for its products when the demand is greatest, and if those that cry loudest for railway legislation, would themselves be subject to the same limitation, they would howl the loudest. If when potatoes were scarcest the farmer could charge no more than when they were plenty, and the cotton spinner no more for his cloth when the demand was greatest, and the supply least, nor the steel manufacturer increase his price in a barren market, a trade revolution would be precipitated that would rock the nation to its foundation. Yet these same potato growers, cotton spinners and steel manufacturers, who have lived and are living and prospering by reason of this very law, demand that transportation be regulated in this way.

When the demand for transportation is greatest the railroad can charge no more than when the demand for transportation is light, nor can they charge less when the demand is light. Yet when it is heavy there is a decrease in earnings. The very nature of the business makes it so, depending as it does to so great an extent on the manual or labor element and when the physical capacity of the railway plant is taxed to its highest, the efficiency of the man factor is lowered, with its accompaniment of attendant losses incident to lowered human efficiency.

The ordinary business interests undisturbed by regulatory legislation makes during fat years earnings for a surplus to carry through the lean ones, or it may expend a part of the earnings in increased machinery, or factory equipment that may lay dormant and idle until prosperous times. This cannot be with the railroads. We demand from them the highest capacity and greatest efficiency at the lowered level cost at

Digitized by Google

all times. If through inability, caused by excessive regulations and consequent curtailment of expenses, they are unable to respond promptly, and we are occasioned inconveniences or loss of profits through inadequate transportation, we berate them soundly and condemn them utterly, and proceed with due speed to the legislature or congress to fasten some other restriction upon them.

What the legislators of this country need in dealing with railroads, is less passion and prejudice, and a little more first study of economics, and the production of some legislation that will tend to return some of the confidence of the investors of this country in the securities of railways to the end that the development of this nation and every part of it shall proceed accelerated and not diminueted.

The conditions of congestion that faces the railroads of this country to-day was brought about through inability of the railroads to continue construction and provide themselves with the facilities to handle business, and this condition comes to a very great degree through the lack of confidence of investors and the railroads' inability to earn a surplus.

The Awards of the Firemen's Wage Arbitration Board

THE following is the full text of the awards made by the Erdman Arbitration Board in the settlement of the Firemen's Wage Controversy:

"The railroads involved in this concerted arbitration compromise practically all that part of the United States east of the Mississippi and north of the Ohio and Potomac rivers. The trackage of these railroads is approximately 70,000 miles of main line, being something more than one fourth of the entire trackage of the United States. These railroads represent practically 40 per cent of the total capitalization for all railroads in the United States; they carried about 47 per cent of the ton miles and about 43 per cent of the passenger miles of all railroads of the United States.

"The firemen employed on these railroads number in the neighborhood of 31,000 for the year 1912, and the wages for the year 1912 was approximately $29,000,000. These figures indicate, with some degree of certainty and emphasis, the magnitude of the problem and the far-reaching character of the controversies submitted for the arbitrament of this Board. Reference must be had to the three printed and bound volumes of evidence taken on the stand, comprising more than two thousand (2,000) pages, and four (4) volumes of printed exhibits, comprising perhaps as many more pages in the aggregate, and the exhaustive briefs of counsel, in order to form a due estimate of the comprehensive and difficult task undertaken, the conclusions of which by the Board are now stated.

"After due deliberation and consideration of all the evidence, exhibits, arguments and briefs of counsel representing the respective interests, the Board has reached a conclusion in respect of the demands of the firemen for increased rates of pay and for improved conditions of service, and make the awards as follows upon all the matters contained in the articles of submission, that is to say,

WE AWARD

"Article 1.—That ten hours or less, or one hundred miles or less, shall constitute a day's work in all classes of service, except as otherwise specified. The time for which firemen will be paid shall begin at the time he is required to report for duty, and end when the engine is delivered at the point designated.

"Article 2.—The following rates of wages per day shall be the minimum rates paid in all classes of service on all railroads parties to this arbitration:

(a) PASSENGER SERVICE.

Weights of locomotives in pounds on drivers:	
Less than 80,000 pounds	$2 45
80,000 to 100,000 pounds	2 50
100,000 to 140,000 pounds	2 60
140,000 to 170,000 pounds	2 70
170,000 to 200,000 pounds	2 85
200,000 to 250,000 pounds	3 00
250,000 to 300,000 pounds	3 20
300,000 to 350,000 pounds	3 40
All engines over 350,000 pounds on drivers	3 60
Mallet engines regardless of weight on drivers	4 00

FREIGHT SERVICE.

Less than 80,000 pounds	$2 75
80,000 to 100,000 pounds	2 85
100,000 to 140,000 pounds	3 00
140,000 to 170,000 pounds	3 10
170,000 to 200,000 pounds	3 20
200,000 to 250,000 pounds	3 30
250,000 to 300,000 pounds	3 55
All engines over 300,000 pounds on drivers	4 00
Mallet engines regardless of weight on drivers	4 00
Where two firemen are employed on a locomotive as a result of the application of Article 6 hereinafter the rates of pay to each fireman shall be as follows:	
Weight on drivers, 100,000 up to 250,000 pounds	2 75
Weight on drivers over 250,000 pounds	3 00

(b) SWITCHING SERVICE.

Switch engine firemen on locomotives weighing less than 140,000 pounds on drivers, per day of ten (10) hours or less	2 50
Switch engine firemen on engines, weighing 140,000 pounds or over on drivers, per day of ten (10) hours or less (excluding Mallets $4 00)	2 60

(c) HOSTLERS.

Hostlers, per day of ten (10) hours or less	2 40
If hostlers are employed in handling engines between passenger stations, and around houses or yards, or on main tracks they will be paid, per day of ten (10) hours or less	3 25
If men are employed to assist hostlers in handling engines between passenger stations and round houses or yards, or on main tracks, they will be paid per day of ten (10) hours or less	2 50

(d) HELPER ON ELECTRIC LOCOMOTIVE.

The term "helper" will be understood to mean the second man employed on electric locomotives, and he shall receive in passenger service, per day of ten (10) hours, or less, one hundred (100) miles or less	2 50
In through freight per day of ten (10) hours or less, one hundred (100) miles or less	2 80
In switching service, per day of ten (10) hours or less	2 50

All working conditions applicable to steam locomotive firemen in steam service will apply to helpers in electric service.

(e) Firemen on locomotives in pusher and helper service, mine runs, work, wreck, belt line and transfer

Digitized by Google

service, and all other unclassified service will be paid through freight rates according to the class of engine.

(f) Firemen in local freight service will be paid fifteen (15) cents in addition to through freight rates according to class of engine.

"(g) For the purpose of officially classifying the locomotive, each railroad, party to this arbitration, will keep bulletins posted at all terminals showing accurately the weight on drivers of all engines in its service.

"Article 3.—(a) Overtime in all classes of service, except passenger, will be paid for pro rata on the minute basis. Except as otherwise specified ten (10) hours, or one hundred (100) miles will be the basis for computing overtime. Miles and hours will not be counted together; when miles exceed hours, miles will be allowed, and when hours exceed miles, hours will be allowed.

"(b) Overtime in passenger service (except suburban service) will be paid at the rate of thirty (30) cents per hour on the basis of twenty (20) miles an hour, computed on the minute basis. Five (5) hours or less, one hundred (100) miles or less, to constitute a day's work.

"(c) On short turn around runs, no single one of which exceeds eighty (80) miles, including suburban service, overtime shall be paid for all time actually on duty, or held for duty, in excess of eight (8) hours (computed on each run from the time required to report for duty to end of that run) within twelve (12) consecutive hours; and also for all time in excess of twelve (12) consecutive hours, computed continuously from the time first required to report to the final release at the end of the last run. Time shall be counted as continuous service in all cases where the interval of release from duty at any point does not exceed one hour.

"Article 4.—No initial terminal delay is allowed beyond that involved in the rule that pay shall begin in all cases at the time fireman is required to report for duty, but final terminal delay after the lapse of one hour will be paid for at the end of the trip, at the overtime rate, according to the class of engine, on the minute basis. For freight service final terminal delay shall be computed from the time the engine reaches the designated main track switch connecting with the yard track. For passenger service final terminal delay shall be computed from the time the train reaches the terminal station. If road overtime has commenced terminal overtime shall be computed to the point of final release.

"Article 5.—Firemen in pool freight and in unassigned service held at other than home terminal, will be paid continuous time for all time so held after the expiration of eighteen (18) hours from time relieved from previous duty, at the rate per hour paid him for the last service performed. If held fourteen (14) hours after the expiration of the first twenty-eight (28) hour period, he will be paid continuous time for the next succeeding ten (10) hours, or until the end of the twenty-four (24) hour period, and similarly for each twenty-four (24) hour period thereafter. Should a fireman be called for duty after pay begins, his time will be computed continuously.

"Article 6.—When a second fireman is deemed necessary on any engine or assistant is deemed necessary on any engine where one fireman is employed, the matter will be taken up with the proper officials by the firemen's committee. Failing to reach a settlement the matter shall be referred to an adjustment commission, to be composed of five (5) persons, two (2) of whom are to chosen by the railroad company, two (2) by the firemen's committee, and one (1) to be seelcted by the four (4) thus chosen, who shall be the chairman of the commission. Should the four (4) men fail to agree upon the fifth, then three (3) days after the last of the four (4) is selected, the fifth man shall be named by the presiding judge of the United States Commerce Court. If, for any reason, the selection of the fifth man cannot be made by the presiding judge of said court, he shall be named by the United States District Judge of the district in which the controversy may have arisen. All expenses incurred in connection with the settlement of such matters shall be borne equally by the two (2) parties to the controversy.

"Article 7.—Firemen will be relieved of cleaning engines. Lubricators will be filled, headlight, markers and other lamps cared for (including filling but not lighting), and all supplies placed on engines at points where round house or shop force are maintained. The firemen shall not be relieved of responsibility of knowing that engines for which they are called are properly equipped for service.

"Article 8.—Firemen tied up between terminals on account of the hours of service law, will be paid continuous time from initial point to tie up point. When they resume duty on a continuous trip they will be paid from the tie up point to terminal on the following basis: for fifty miles or less, or five hours or less, fifty miles pay; for more than fifty miles up to one hundred miles, or over five hours, and up to ten hours, one hundred miles pay; over one hundred miles, or over ten hours, at schedule rates. This provision does not permit the running of firemen through terminal or around other firemen at terminals, unless such practice is permitted under the pay schedule.

"Article 9.—The earnings of firemen in any class of service shall not be diminished by the provisions of this award; and if the rates that were higher or the conditions that were better antecedent to the award are necessary to guarantee this requirement they shall be maintained. Neither shall the earnings of the firemen in any class of service be increased above what the higher rates of pay and the conditions that were better antecedent hereto guaranteed him by a combination of the rates herein established with the conditions of service antecedent hereto, or vice versa.

"It is not intended that any of the terms or provisions of this award shall debar committees from taking up for adjustment with the management of the respective railroads any questions or matters not specifically covered herein.

"Article 10.—This award shall take effect at the time and in the manner provided by the Act of Congress entitled 'An Act concerning carriers engaged in interstate commerce and their employes, approved June 1, 1898. And all parties to this arbitration having stipulated in writing, and incorporated in the record an agreement, extending the time within which the award may be made and filed, from the second (2nd) day of April, 1913, to and including the twenty-third (23rd) day of April, 1913, the arbitrators now, on this twenty-third (23rd) day of April, 1913, signed this award without dissent in any particular to any of its provisions by anyone of them, and have required the secretary to attest the same.

"Signed WILLIAM L. CHAMBERS,
WILLIAM W. ATTERBURY,
ALBERT PHILIPS."

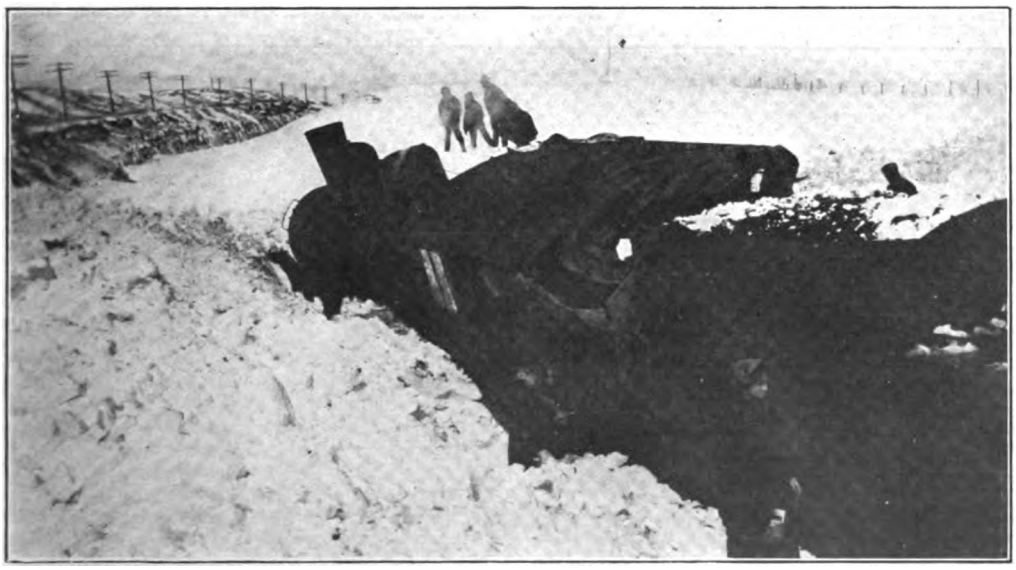
Difficulties of Winter Railway Operations in the Prairie Country of the Northwest

THE great snow drifts in the northern Rockies are probably more troublesome and costly than the banks of sand and snow which sometimes impede the trains in the prairie country of the Northwestern States, but they are far from being so freakish. Whenever a high wind accompanies a heavy snow there are large areas left bare, while in low places, and especially in deep track cuts, the snow and sand will often pile from twenty-five to thirty feet deep.

Recently, when there were signs of spring in fully half of the country, just such a storm swept over eastern Colorado. Near Akron, on the Chicago, Burlington and Quincy Railroad, the drifts were twenty feet deep. One train tried to plow its way through a big snowbank, but it could not make headway until after a large quantity of the snow and sand had been shoveled away. In some instances, engines were cut loose from stranded trains to clear the track. The accompanying photographs illustrate the character of the difficulties encountered.

A WRECKING TRAIN AT WORK IN A SNOWDRIFT ON THE NORTHWESTERN PRAIRIES. NOTE ABSENCE OF SNOW ON THE LEVELS.



ENGINE ENDEAVORING TO CLEAR TRACK AFTER A PORTION OF THE SNOW HAD BEEN REMOVED BY SHOVELING.

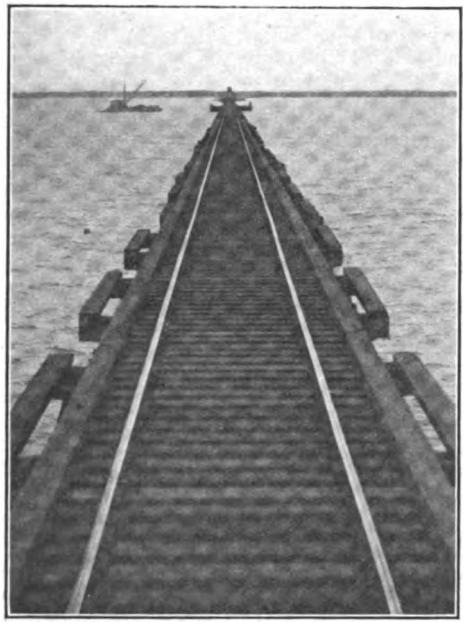
The Albemarle Sound Trestle



FIVE MILE NORFOLK AND SOUTHERN TRESTLE OVER ALBEMARLE SOUND, NORTH CAROLINA.

THE accompanying photograph, taken from the rear platform of a Norfolk and Southern train while crossing Albemarle Sound, North Carolina, shows one of the longest railroad bridges in the world over navigable waters.

By the use of this bridge, the handling capacity of the road has been increased at least 1,000 per cent per day over the old method of transporting freight and passengers by steamer. Freight trains of thirty cars now cross in about fifty minutes, while to transfer by the old system would have taken twelve hours. Passenger trains cross in twenty-five minutes.

The bridge is recognized as being one of the most important engineering feats undertaken in eastern North Carolina, and means much for the development of that rich agricultural section. Its length is 28,000 feet, about five and one-third miles. Roughly speaking, 4,000,000 feet of lumber, 1,000 carloads of cypress spiles, 250 cars of steel, and a train load of spikes and bolts have been used in its construction.

The spiles were huge, the longest being 95 feet, and none shorter than 70 feet. They were driven into the bed of the sound forty to sixty feet. The deck of the bridge is over thirteen feet above high water.

There are two large spans, and five smaller ones for gas boats, etc.

At the Scherzer roller lift draw there is 140 feet of open space, and at the smaller draw a clearance of 35 feet each side of the swing.

Improvement Work on the Denver and Rio Grande
